LITTLE MISSOURI RIVER BASIN.

LITTLE MISSOURI RIVER NEAR ALZADA, MONT.

LOCATION.—Near southwest corner of T. 8 S., R. 60 E., at Walker's ranch, 300 yards below site of proposed dam, 2 miles below mouth of Thompson Creek, and 4 miles below Alzada, in Fallon County.

DRAINAGE AREA.—780 square miles.

RECORDS AVAILABLE.—June 18, 1911, to September 30, 1917.

GAGE.—Overhanging chain gage on right bank, read by John Walker; gage used during 1911 was vertical staff on left bank, 150 feet downstream. Datum of chain gage 0.08 foot lower than that of staff gage.

DISCHARGE MEASUREMENTS.—Made by wading or from cable.

CHANNEL AND CONTROL.—Bed shifts during high water. Stream sluggish. Banks cut 5 to 15 feet in sandy soil. Two channels at medium and one at high stage.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.18 feet at 7 p. m. April 11 (discharge, 3,250 second-feet); channel dry October 1–7, January 4–6, and September 19–30, (discharge, 0).

1911–1917: Maximum stage recorded, 15.3 feet April 6, 1912 (discharge, 4,550 second-feet); minimum stage, channel dry July 6 to August 7, and October 14–18, 1911; September 9–15, 1913; September 8–10, 12–30, and October 1–7, 1916; January 4–6, 1917, and September 19–30, 1917.

ICE.—Stage-discharge relation seriously affected by ice. Data obtained is inadequate to estimate winter flow. Discharge not computed January 13 to March 26.

DIVERSIONS.—None.

REGULATION.—None of importance. Some flood water in spring is stored in coulees on tributaries for use in irrigating small tracts.

ACCURACY.—Stage-discharge relation permanent. Rating curve well defined between 80 and 2,000 second-feet. Gage read to quarter-tenths twice daily. Daily dis charge obtained by applying mean daily gage height to rating table. Records good.

No discharge measurements were made during the year.

Daily discharge, in second-feet, of Little Missouri River near Alzada, Mont., for the year ending Sept. 30, 1917.

KNIFE RIVER BASIN.

KNIFE RIVER NEAR BRONCHO, N. DAK.

LOCATION.—In SE. ¼ sec. 4, T. 142 N., R. 90 W., at ranch half a mile below mouth of Elm Creek, 15 miles above Spring Creek, and 6 miles from Broncho, in Mercer County.

DRAINAGE AREA.—1,260 square miles; drainage area at original location 2 miles downstream, probably 5 square miles greater.

RECORDS AVAILABLE.—May 29, 1903, to September 30, 1917.

GAGE.—Chain on cantilever timber on left bank near observer's house; datum unchanged since March 23, 1905. Gage read by C. D. Smith.

DISCHARGE MEASUREMENTS.—Made from cable 500 feet below gage or by wading.

CHANNEL AND CONTROL.—Stream bed below gage large gravel and stones, nearly permanent. Channel narrow with steep banks which are not overflowed at gage heights less than 20 feet.

EXTREMES OF DISCHARGE.—Maximum stage during year, 17.0 feet March 30, caused by ice jam; maximum discharge, 1,480 second-feet, March 31; minimum stage, 3.3 feet September 10 (discharge, 4 second-feet); river reported dry September 6–8, 1905, and September 18–19, 1908.

ICE.—Stage-discharge relation seriously affected by ice and gage records discontinued during part of winter.

ACCURACY.—Stage-discharge relation practically permanent during the year, except as affected by ice. Rating curve fairly well defined below 2,000 second-feet. Gage read to tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good. Indirect method used March 27 to April 9, because of ice. Records fair.

Discharge measurements of Knife River near Broncho, N. Dak., during the year ending Sept. 30, 1917.

September	4	4	4.0	238

NOTE.—See footnote to daily discharge table.

HEART RIVER BASIN.

HEART RIVER NEAR RICHARDTON, N. DAK.

LOCATION.—In sec. 21, T. 138 N., R. 92 W., opposite residence of W. F. Church, 1 mile below highway bridge and 11 miles south of Richardton.

DRAINAGE AREA.—1,250 square miles.

RECORDS AVAILABLE.—May 18, 1903, to September 30, 1917.

GAGE.—Chain on cantilever timber opposite observer's house, on right bank of river. Auxiliary chain gage on highway bridge 1 mile above observer's house, used March 23 to June 1, 1917, because of damage to regular gage. The two gage datums are so related that readings at the bridge are approximately 10.0 feet less than on the gage regularly used.

DISCHARGE MEASUREMENTS.—At high stages from bridge; at ordinary low stages by wading.

CHANNEL AND CONTROL.—Channel fairly permanent, but control sometimes changed considerably during part of year by the building of dams by beavers a quarter of a mile below gage.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 33.7 feet April 1 (discharge, 1,850 second-feet); minimum stage, 25.2 feet August 25 (discharge, 0.4 second-foot).

1903–1917: Maximum stage recorded, 25.9 feet from chain gage at highway bridge June 10, 1906 (discharge, 8,020 second-feet); river reported dry July 26 to August 11, August 20–23, 1903, September 1–19, 1905, July 22–27, 1914.

ICE.—Stage-discharge relation seriously affected by ice; flow estimated from observer's reports and gage heights and weather records. Winter flow very small.

REGULATION AND DIVERSIONS.—No storage or diversions appreciably affecting the discharge.

ACCURACY.—Stage-discharge relation affected by dam built by beavers. Rating curve poorly defined. Gage read to half-tenths once daily. Discharge determined by shifting-control method. Records poor.

Discharge measurements of Heart River near Richardton, N. Dak., during the year ending Sept. 30, 1917.

CANNONBALL RIVER BASIN.

CANNONBALL RIVER NEAR STEVENSON, N. DAK.

LOCATION.—At boundary of Standing Rock Indian Reservation in NW. ¼, sec. 21, T. 133 N., R. 82 W., 60 rods above house of observer, F. Bingenheimer; 2 miles southeast of Stevenson schoolhouse, 4 miles south of Timmer, N. Dak., and 4 miles above mouth of Dogtooth Creek. From 1911 to 1915 records were maintained at M. H. Burdick's, 1 mile farther upstream.

DRAINAGE AREA.—3,650 square miles.

RECORDS AVAILABLE.—June 10, 1903, November 30, 1908; August 9, 1911, to September 30, 1917.

GAGE.—Chain gage on projecting cantilever timber at left bank. Datum of the gage is precisely the same as the datum of the gage maintained at the same point from 1903 to 1910. Read by F. Bingenheimer.

Discharge measurements.—At low and medium stages made by wading at rapids a few rods below observer's house; at medium and high stages measurements are made by use of car and cable 20 rods above the gage.

Channel and control.—At the rapids at the ford 20 rods below the gage the bed is of stones and small boulders. Control has not changed considerably.

Extremes of discharge.—Maximum stage recorded during year, 9.4 feet April 5, caused by ice jams; maximum discharge, 1,880 second-feet April 13; minimum stage, 2.5 feet September 5 (discharge, 2 second-feet).

1903–1908 and 1911–1918: Maximum stage recorded, 21.05 feet (equivalent to 11.05 feet at present location) April 2, 1912 (discharge, 6,560 second-feet); no flow during periods each year 1904–1908 and 1913.

Ice.—Stage-discharge relation seriously affected by ice.

Regulation.—No dams or diversions appreciably affect the flow.

Accuracy.—Stage-discharge relation nearly permanent. Rating curve fairly well defined. Gage read to half-tenths daily. Daily discharge ascertained by applying daily gage height to rating table; indirect method used March 27 to April 10 because of ice. Records fair.

Discharge measurements of Cannonball River near Stevenson, N. Dak., during the year ending Sept. 30, 1917.

GRAND RIVER BASIN.

NORTH BRANCH OF GRAND RIVER AT HALEY, N. DAK.

LOCATION.—At highway bridge near northeast corner of sec. 36, T. 129 N., R. 100 W., about 20 rods south of post office at Haley, in Bowman County.

DRAINAGE AREA.—500 square miles.

RECORDS AVAILABLE.—May 17, 1908, to September 30, 1917.

GAGE.—Stage obtained by measuring distance from bench mark on highway bridge to water surface by means of a metallic tape weighted at the end. From 1908 to 1911 a vertical staff gage 100 feet above the present bridge was used. Gage read by Wesley Nelson.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

CHANNEL AND CONTROL.—Bed of stream gravel and sand; fairly permanen .

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.2 feet April 6, obstructed by ice; maximum discharge, 602 second-feet April 9; no flow June 25–28.

1908–1917: Maximum stage recorded, 9.85 feet June 13, 1915 (discharge, 3,500 second-feet); no flow June 25–28, 1917.

ICE.—Stage-discharge relation seriously affected by ice; gage observations discontinued during winter.

REGULATION.—Flow not appreciably affected by any diversions or dams above station.

ACCURACY.—Stage-discharge relation presumably nearly permanent, except when affected by ice. Gage read daily during floods and twice weekly through remainder of season, to half-tenths. Records roughly approximate.

The following discharge measurement was made by E. F. Chandler:

August 23, 1917: Gage height, 0.86 foot; discharge, 0.2 second-foot.

Monthly discharge of Grand River near Wakpala, S. Dak., for the year ending Sept. 30, 1917.

Month.	Discharge in second-feet.			Run-off in acre-feet.

CHEYENNE RIVER BASIN.

CHEYENNE RIVER NEAR HOT SPRINGS,[1] S. DAK.

Location.—In sec. 9, T. 9 S., R. 5 E., 1 mile above dam site of proposed Angostura irrigation project, 5 miles south of Cascade Springs, and 11 miles south of Hot Springs, Fall River County. Nearest tributary, Cascade creek, enters 2½ miles above.

Drainage area.—Not measured.

Records available.—September 11, 1914, to September 30, 1917. Station maintained at Edgemont June 19, 1903, to November 30, 1906, but flow is not directly comparable, as a number of small tributaries intervene.

Gage.—Inclined slope gage on right bank one-third of a mile below Noerenberg's fruit farm; read by Fred Noerenberg. Friez water-stage recorder used prior to April 2, 1915, but abandoned, as stream carries too much silt during flood.

Discharge measurements.—Made from cable 75 feet below gage or by wading.

Channel and control.—Bed composed of compacted gravel on which silt is deposited; shifts frequently. Principal control a short distance downstream; shifts during severe floods. Right bank subject to overflow for distance of 100 feet at stage of 14 feet.

Extremes of discharge.—Maximum stage recorded during year, 10.80 feet at 11 p. m. May 22 (discharge, 16,100 second-feet); minimum stage, 0.40 foot on September 6 (discharge, 10 second-feet).

Ice.—Spring water from Cascade creek prevents formation of ice, except for brief periods.

Diversions.—Permits granted for diversions amounting to 93.4 second-feet from Cheyenne River above station, and 43.4 second-feet from Cascade creek.

Regulation.—None.

Accuracy.—Stage-discharge relation not permanent; affected by ice for short periods during winter. Rating curve well defined between 20 and 20,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table, except for period May 24 to September 30. when discharge was computed by the indirect method for shifting control. Records good, except for periods affected by ice, when they are fair.

Discharge measurements of Cheyenne River near Hot Springs, S. Dak., during the year ending Sept. 30, 1917.

RAPID CREEK AT BIG BEND, S. DAK.

LOCATION.—In NW. ¼ sec. 8, T. 1 N., R. 6 E., at Big Bend, in Pennington County. Nearest tributary, Deer Creek, enters 2½ miles upstream.

DRAINAGE AREA.—332 square miles (measured on topographic map).

RECORDS AVAILABLE.—March 23, 1915, to September 30, 1917.

GAGE.—Vertical staff just below tailrace of Dakota Power Co.; read by power-house operator.

DISCHARGE MEASUREMENTS.—Medium and low stage measurements by wading.

CHANNEL AND CONTROL.—Shifts at long intervals.

Ice.—Stage-discharge relation affected by ice during some winters.

Diversions.—Dakota Power Co. diverts water above station but returns it just above gage.

Cooperation.—Station maintained by Dakota Power Co. Records furnished through courtesy of United States Forest Service.

Daily discharge, in second-feet, of Rapid Creek at Big Bend, S. Dak., for the period Mar. 23, 1915, to Sept. 30, 1917.

February	29	26	27.9	1,550
March	30	25	28.5	1,750
April	85	20	50.4	3,000
May	255	78	152	9,350
June	270	112	177	10,500
July	146	30	69.4	4,270
August	72	40	53.3	3,280
September	47	34	40.8	2,430

NOTE.—Discharge Jan. 1 to Mar. 14, 1916, estimated because of ice. No gage-height record June 1-30, 1916; discharge estimated from comparison with Rapid Creek at Rapid City.

BELLE FOURCHE RIVER NEAR BELLE FOURCHE, S. DAK.

LOCATION.—In sec. 2, T. 8 N., R. 2 E., at diversion dam of Belle Fourche irrigation project, 1½ miles below Belle Fourche, in Butte County.

DRAINAGE AREA.—4,270 square miles.

RECORDS AVAILABLE.—May 10 to November 30, 1906; January 1, 1912, to September 30, 1917. May 26, 1903, to June 23, 1906, for station at the west outskirts of Belle Fourche; the records at these points are not directly comparable, as Redwater River enters between the two stations, and water is diverted from Belle Fourche River.

GAGE.—Inclined staff 100 feet from crest of diversion dam, and a gage in canal. See "Computation of discharge."

COMPUTATION OF DISCHARGE.—The following information was supplied by the United States Reclamation Service:

The records of daily discharge represent the entire flow of the river at the diversion dam and have been corrected for water diverted through Inlet canal and passed through the sluice gages. The diversion dam acts as a weir; the crest is 400 feet long; the gage is about 100 feet from the crest and is read twice daily. Careful discharge measurements were made in the river above and below the dam before the coefficient was established, and the discharge rating table as originally computed has not been changed. The quantity diverted is determined at a gaging station maintained on Inlet canal, and the rating curve is checked by frequent discharge measurements. The sluice gates are seldom used and the flow through them is estimated.

DIVERSIONS.—In that part of the drainage area in Wyoming there were, prior to July 1, 1914, adjudicated diversions of 25 second-feet from Belle Fourche River and 237 second-feet from tributaries. In South Dakota there are authorized diversions of 102 second-feet from Belle Fourche River above the gaging station and approximately 2,500 second-feet from tributaries; below the station there are authorized diversions of 3,102 second-feet from Belle Fourche River.

ACCURACY.—The United States Reclamation Service considers the records fair.

COOPERATION.—Complete records furnished and stations maintained by United States Reclamation Service.

Daily discharge, in second-feet, of Belle Fourche River near Belle Fourche, S. Dak., for the year ending Sept. 30, 1917.

WHITE RIVER BASIN.

WHITE RIVER NEAR INTERIOR, S. DAK.

LOCATION.—Near southwest corner of sec. 7, T. 4 S., R. 18 E., at boundary of Pine Ridge Indian Reservation, at steel highway bridge 3 miles southwest of Interior, on line between Jackson and Pennington counties.

DRAINAGE AREA.—4,090 square miles.

RECORDS AVAILABLE.—August 24, 1911, to September 30, 1917; June 24, 1904, to November 30, 1906, at the original station in sec. 10, T. 4 S., R. 18 E.

GAGE.—A vertical staff attached to downstream side of first pier at left end of highway bridge; read by George Carlbom.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

CHANNEL AND CONTROL.—Silt and sand, changing gradually.

EXTREMES OF DISCHARGE.—Maximum stage during year, 11.8 feet at 5 p. m. March 23, caused by ice jams; maximum discharge, at 7.7 feet March 30 (discharge, 3,260 second-feet); minimum stage, 3.2 feet August 5 and September 8–13 (discharge, 8 second-feet).

1914–1906 and 1911–1917: Maximum stage recorded, 16 feet March 8, 1905 (discharge, 16,500 second-feet); channel reported dry July 13–15, 19–29, September 26 to October 4, 1914.

ICE.—Stage-discharge relation seriously affected by ice.

DIVERSIONS AND REGULATION.—No diversions or storage reservoirs above are sufficiently great to noticeably affect the flow.

ACCURACY.—Stage-discharge relation changed slightly. Rating curves used October 1 to November 11 and March 28 to September 30 fairly well defined. Gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records fair.

Discharge measurements of White River near Interior, S. Dak., during the year ending Sept. 30, 1917.

WHITE RIVER NEAR WESTOVER, S. DAK.

LOCATION.—In sec. 32, T. 3 S., R. 29 E., at boundary of Rosebud Indian Reservation, at steel highway bridge near Westover, 2 miles below mouth of South Fork of White River, 12 miles south and slightly east of Murdo, on Chicago, Milwaukee & St. Paul Railway.

DRAINAGE AREA.—7,850 square miles.

RECORDS AVAILABLE.—August 25, 1911, to September 30, 1917.

GAGE.—Chain gage attached to steel highway bridge; read by E. F. Sterner. Vertical staff gage with same datum as chain gage is bolted to concrete abutment of bridge, left bank. During 1911 the gage was a vertical staff on the left bank about 40 rods downstream from the present location, and its datum was such as to make readings about 2 feet greater than from the present gage.

DISCHARGE MEASUREMENTS.—Made from the highway bridge.

CHANNEL AND CONTROL.—Sand, silt, and quicksand; scours and shifts suddenly.

EXTREMES OF DISCHARGE.—Maximum stage during year, 15.1 feet at 8 p. m. March 22 (stage-discharge relation affected by ice); minimum stage, 6.2 feet July 30 (discharge, 85 second-feet).

1911–1915: Maximum stage recorded, 13 feet April 4, 1915 (discharge, 15,200 second-feet); minimum stage, 5.3 feet October 15, 1911 (discharge, 14 second-feet).

ICE.—Stage-discharge relation seriously affected by ice.

DIVERSIONS AND REGULATIONS.—No diversions or storage reservoirs above large enough to noticeably affect flow.

ACCURACY.—Stage-discharge relation not permanent. Gage read to half-tenths once daily. Discharge determined by shifting-control method. Records fair.

Discharge measurements of White River near Westover, S. Dak., during the year ending Sept. 30, 1917.

SOUTH FORK OF WHITE RIVER NEAR WESTOVER, S. DAK.

LOCATION.—In NE. ¼ sec. 15, T. 43 N., R. 28 W., on Rosebud Indian Reservation, near house of observer, Mrs. C. H. Kendall, 2 miles above mouth of stream, 4 miles south of Westover, and 16 miles south of Murdo.

DRAINAGE AREA.—1,590 square miles.

RECORDS AVAILABLE.—June 26, 1912, to September 30, 1917.

GAGE.—Chain gage on projecting timber, on right bank 5 rods below cable. In 1912 and 1913, vertical staff gages at the same datum and nearly the same location were used.

DISCHARGE MEASUREMENTS.—Made from cable or by wading.

CHANNEL AND CONTROL.—Sandy and shifting.

EXTREMES OF DISCHARGE.—Maximum stage during year, 7.1 feet at 6 p. m., March 22, caused by ice jam; minimum discharge, 30 second-feet, September 30.

1912–1917: Maximum discharge recorded at 2.75 feet April 7, 1915 (discharge, 2,780 second-feet); minimum discharge, 20 second-feet, October 21, 1914.

ICE.—Stage-discharge relation seriously affected by ice; flow estimated from observer's reports and records of temperature and precipitation.

DIVERSIONS AND REGULATION.—No known diversions or storage reservoirs above are large enough to noticeably affect the flow.

ACCURACY.—Stage-discharge relation not permanent. Gage read daily to half-tenths. Discharge determined by shifting-control method. Records roughly approximate.

Discharge measurements of South Fork of White River near Westover, S. Dak., during the year ending Sept. 30, 1917.

PLATTE RIVER BASIN.

NORTH PLATTE RIVER NEAR NORTHGATE, COLO.

Location.—In sec. 11, T. 11 N., R. 80 W., at highway bridge on interstate highway 6 miles south of Colorado-Wyoming line and 6 miles northwest of Northgate, in Jackson County. Three small tributaries—Camp, Threemile, and Sixmile creeks—enter North Platte River between station and State line. These have very little flow except spring run-off.

Drainage area.—1,440 square miles (measured on Colorado typographic map, scale 1:500,000).

Records available.—May 23, 1915, to September 30, 1917.

Gage.—Chain gage installed on downstream side of bridge May 13, 1916; read by Mrs. H. L. McCasland. Original gage was a staff gage on middle pier of bridge at same datum.

Discharge measurements.—Made from two-span bridge or by wading.

Channel and control.—Bed composed of sand, gravel, and small boulders. Principal control of 200 feet downstream at small rapids; shifts occasionally. Banks not subject to overflow.

Ice.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

Extremes of discharge.—Maximum stage recorded during year, 6.0 feet on May 18 (discharge, 4,840 second-feet); minimum discharge occurred during winter.

Diversions.—There are court decrees for diversions of 3,060 second-feet from North Platte River and tributaries in Colorado. During 1917 Michigan ditch diverted 713 acre-feet from a tributary of the North Platte to the Cache la Poudre drainage basin between July 1 and September 8, 1917.

Regulation.—None.

Accuracy.—Stage-discharge relation not permanent; affected by ice during winter. Rating curve used October 1 to May 31, 1917, and curve used June 1 to September 30 are both fairly well defined between 200 and 3,500 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage heights to rating table, except for periods July 8 to 21, July 23 to August 9, and September 23 to 30, when there was no gage-height record and discharge was based on comparative hydrograph of North Platte at Saratoga. Records good, except for periods of missing gage heights and for discharges above 3,500 second-feet when they are fair.

Discharge measurements of North Platte River near Northgate, Colo., during the year ending Sept. 30, 1917.

NORTH PLATTE RIVER AT SARATOGA, WYO.

LOCATION.—At highway bridge at Saratoga, Carbon County. Nearest tributary, Spring Creek, enters 2 miles above.

DRAINAGE AREA.—2,880 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—June 9, 1903, to October 31, 1906; April 1 to December 17, 1909; April 27, 1911, to October 31, 1912; April 1, 1915, to September 30,1917. State engineer maintained station at this point during 1913 and 1914.

GAGE.—Chain gage on upstream side of bridge; read by Miss Nora Doggett and Miss Carrie Priquet. Original gage read prior to 1911 was vertical staff 100 yards below bridge. No determined relation between gages.

DISCHARGE MEASUREMENTS.—Made from two-span highway bridge or by wading near control.

CHANNEL AND CONTROL.—Bed composed of coarse gravel and small boulders. Control at rapids 500 feet downstream; fairly permanent. Banks not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 10.4 at 7 a. m. June 20 and 9 a. m. June 23 (discharge, 13,800 second-feet); minimum discharge 262 second-feet, January 19–24.

ICE.—Stage-discharge relation seriously affected by ice; flow estimated from discharge measurements, observer's notes, and temperature records.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 83 second-feet from the North Platte between Saratoga and State line.

REGULATION.—None.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve well defined between 250 and 12,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records excellent, except during period affected by ice when they are good.

Discharge measurements of North Platte River at Saratoga, Wyo., during the year ending Sept. 30, 1917.

NORTH PLATTE RIVER ABOVE PATHFINDER, WYO.

LOCATION.—In sec. 27, T. 26 N., R. 84 W., 900 feet below mouth of Lost Creek and three-quarters of a mile below mouth of Black Canyon, Carbon County. Backwater from Pathfinder reservoir reaches within 2½ miles of station.

DRAINAGE AREA.—7,410 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—October 7, 1913, to September 30, 1917.

GAGE.—Friez water-stage recorder on right bank 900 feet below Lost Creek.

DISCHARGE MEASUREMENTS.—Made from cable at gage.

CHANNEL AND CONTROL.—Bed composed of small boulders. Gage at lower end of pool 600 feet long. Control located at rapids and is practically permanent. Banks high and not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage during year from water-stage recorder, 6.2 feet at 2 p. m. June 26 (discharge, 18,800 second-feet); minimum discharge occurs during winter when observations are discontinued.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 84 second-feet from North Platte River between Saratoga and the station above Pathfinder.

REGULATION.—None.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve well defined between 300 and 17,000 second-feet. The operation of the water-stage recorder was satisfactory except for short intervals as explained in footnotes. Daily discharge ascertained by applying mean daily gage heights, determined by inspecting gage-height graph, to rating table. Records excellent, except for days of missing gage-heights, when they are fair.

Discharge measurements of North Platte River above Pathfinder, Wyo., during the year ending Sept. 30, 1917.

NORTH PLATTE RIVER AT PATHFINDER, WYO.

LOCATION.—In sec. 24, T. 29 N., R. 84 W., a quarter of a mile below Pathfinder dam and one-third of a mile below old post office of Pathfinder, Natrona County. Nearest tributary, Canyon Creek, enters 2 miles above, in the reservoir.

DRAINAGE AREA.—10,700 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—May 9, 1905, to September 30, 1917.

GAGE.—Chain gage on left bank a quarter of a mile below Pathfinder dam; read by J. C. Austin.

DISCHARGE MEASUREMENTS.—Made from cable 50 feet above gage.

EXTREMES OF DISCHARGE.—No data.

WINTER FLOW.—Stage-discharge relation not seriously affected by ice.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 371 second-feet from tributaries entering the North Platte between the station above Pathfinder and this station. Near Whalen, 150 miles below, the water from Pathfinder reservoir is diverted by Interstate canal and used to irrigate land in Nebraska and Wyoming.

REGULATION.—The Pathfinder dam forms a reservoir 1,025,000 acre-feet in capacity, which materially changes the natural run-off of the river.

COOPERATION.—Records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of North Platte River at Pathfinder, Wyo., for the year ending Sept. 30, 1917.

NORTH PLATTE RIVER NEAR CASPER, WYO.

Location.—In sec. 31, T. 32 N., R. 81 W., at highway bridge at Speas ranch, half a mile below Bessemer Canyon, in Natrona County. Nearest tributary, Bates Creek, enters 3 miles upstream.

Drainage area.—Not measured.

Records available.—April 9 to September 30, 1917.

Gage.—Vertical staff.

Discharge measurements.—Made from bridge.

Channel and control.—Channel apparently permanent. Control below bridge.

Diversions.—Prior to December 31, 1916, there were no approved diversions from North Platte River between station and Pathfinder reservoir.

Regulation.—(See North Platte at Pathfinder.)

Cooperation.—Complete records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of North Platte River near Casper, Wyo., for the year ending Sept. 30, 1917.

NORTH PLATTE RIVER AT McKINLEY, WYO.

Location.—About in sec. 21, T. 31 N., R. 69 W., at highway bridge at McKinley, in Converse County. Nearest tributary, Elkhorn Creek, enters several miles below.

Drainage area.—Not measured.

Records available.—April 1 to September 30, 1917.

Gage.—Vertical staff.

Discharge measurements.—Made from bridge.

Diversions.—Prior to December 31, 1916, adjudicated diversions of 53 second-feet from North Platte River between Casper station and McKinley.

Regulation.—(See North Platte River at Pathfinder.)

Cooperation.—Complete records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of North Platte River at McKinley, Wyo., for the year ending Sept. 30, 1917.

Note.—Figures have been changed slightly to conform to computation rules of United States Geological Survey.

NORTH PLATTE RIVER ABOVE AND BELOW WHALEN, WYO.

Location.—In sec. 11, T. 26 N., R. 65 W., at diversion dam at Whalen, Goshen County. Nearest important tributary is Cottonwood Canyon Creek, an intermittent stream, which enters 1½ miles below.

Drainage area.—16,300 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—May 1, 1909, to September 30, 1917. Prior to October 1, 1916, the combined flow of the river and Interstate canal was given, and in addition, the flow through the Interstate canal. Beginning October 1, 1916, the flow above Whalen is given, which represents the flow of river and Interstate canal combined. The flow below Whalen represents the flow in the river passing the dam (overfall weir) below the Interstate canal diversion. The difference in the two records represents the amount diverted.

Gage.—To determine the flow over the weir a vertical staff is used, its zero being at the weir crest. The discharge is then computed by a weir formula. There are also four sluice gates in the dam, through which the discharge is computed. In the river, 75 feet downstream from the weir gage, is another, with zero 10 feet lower. The second gage is only used in computing the discharge through the gates when the openings are submerged. The discharge through the head gates of the canal is computed from the nine gate openings. A vertical staff located in the canal 1,000 feet below the head gates is used in computing the discharge when the head-gate openings are submerged.

Discharge measurements.—Made from cable 1 mile below weir in order to check the coefficients used in the discharge computations.

Diversions.—Prior to December 31, 1916, there were adjudicated diversions from North Platte River of 32 second-feet between McKinley and the Whalen gaging station, exclusive of the diversion by the United States Reclamation Service. Between Whalen and the State line there are adjudicated diversions of 240 second-feet.

Regulation.—Records show the flow as regulated by Pathfinder reservoir, which stores water for use in the Interstate canal.

Cooperation.—Records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of North Platte River above Whalen, Wyo., for the year ending Sept. 30, 1917.

BIG CREEK NEAR BIG CREEK, WYO.

LOCATION.—In sec. 32, T. 13 N., R. 81 W., at Big Creek ranger station, 2 miles west of Big Creek post office, Carbon County. No important tributary within several miles.

DRAINAGE AREA.—123 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—May 7, 1911, to June 30, 1912; April 4, 1915, to September 18, 1917. State engineer maintained station at this point during 1913 and 1914.

GAGE.—Vertical staff on left bank 50 feet from ranger station; read by J. C. Peryam. Prior to April 29, 1915, gage was placed 1 foot farther out in the stream and gave readings slightly different although referred to same datum.

DISCHARGE MEASUREMENTS.—Made from bridge a quarter of a mile below gage or by wading at gage.

CHANNEL AND CONTROL.—Bed composed of coarse gravel and small boulders. Control at gage, which is on riffle; permanent during 1917. Right bank subject to overflow at stage of 4.2 feet; left bank high. Stage of zero flow, 0.6 foot.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.1 feet at 7 p. m., July 1 (discharge, 985 second-feet); minimum discharge probably occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were no adjudicated diversions from Big Creek above the station in Wyoming, but below the diversions amount to 100 second-feet. In Colorado the Independence ditch diverts from Big Lake to the North Platte drainage basin approximately 80 second-feet, usually from June 10 to July 10 each year. Storage filing for 27,548 acre-feet in Big Lake which supplies Independence ditch.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve well defined between 30 and 900 second-feet. Gage read to hundredths once or twice daily. Daily discharge ascertained by applying one daily gage reading or the mean of two daily gage readings to rating table. Records good, but fragmentary, owing to absence of observer.

Discharge measurements of Big Creek near Big Creek, Wyo., during the year ending Sept. 30, 1917.

FRENCH CREEK NEAR FRENCH, WYO.

Location.—In sec. 4, T. 14 N., R. 81 W., at Jenkins ranch, 3½ miles southeast of French, Carbon County. No tributary between station and mouth 2 miles below.

Drainage area.—64 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—April 30, 1911, to October 31, 1912; April 1, 1915, to September 30, 1917, when station was discontinued. State engineer maintained station at this point 1913 and 1914.

Gage.—Vertical staff on downstream end of heavy rock-filled crib on left bank, a quarter of a mile above head gate of French Creek Irrigation & Development Co's. canal; read by J. W. Jenkins and Miss Pearl Jenkins.

Discharge measurements.—Made from cable 75 feet above gage or by wading.

Channel and control.—Bed composed of small boulders; control 30 feet downstream; shifting occasionally. Banks not subject to overflow.

Extremes of discharge.—Maximum stage recorded during year, 4.1 feet at 6 p. m. June 24 (discharge, 1,240 second-feet); minimum stage occurs during winter.

Ice.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

Diversions.—Prior to December 31, 1916, there were no adjudicated diversions from French Creek above station, but below station there are diversions of 4 second-feet. From North French Creek there are adjudicated diversions of 6 second-feet.

Regulation.—None.

Accuracy.—Stage-discharge relation not permanent; affected by ice during winter. Rating curve used October 1 to November 11 well defined between 20 and 300 second-feet. Curve used March 16 to September 30 not well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying the mean daily gage height to rating table. Records good up to 600 second-feet, above which they are fair.

ENCAMPMENT RIVER AT ENCAMPMENT, WYO.

LOCATION.—In sec. 6, T. 14 N., R. 83 W., at lower end of smelter grounds at Encampment, Carbon County. Nearest tributary, North Fork, enters 1 mile above.

DRAINAGE AREA.—219 square miles (measured on base map of Wyoming; scale, 1,500,000).

RECORDS AVAILABLE.—May 2, 1911, to October 31, 1912; May 29, 1915, to September 30, 1917. State engineer maintained station at this point during 1913 and 1914.

GAGE.—Chain gage on left bank at tailing flume which crosses the river; read by Earl Waite. Prior to June 6, 1912, gage was 175 feet farther downstream, and although referred to same datum, read approximately 1 foot lower, owing to the slope of the river.

DISCHARGE MEASUREMENTS.—Made from cable 125 feet below gage or by wading.

CHANNEL AND CONTROL.—Channel composed of gravel and small boulders which shifted after the high water of 1917. Control is not well defined, though there are small rapids 200 feet downstream.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.9 feet at 6.30 p. m. June 23 (discharge, 4,490 second-feet); minimum discharge occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Three large irrigation ditches divert water at a point 1 mile above station. The smelter company has a pipe line which diverts water above the station, but as the tailrace of the power plant, which the pipe line supplies is just above station, the amount diverted passes the gage. Water is also diverted below station. Prior to December 31, 1916, there were adjudicated diversions from Encampment River amounting to 76 second-feet.

REGULATION.—None.

ACCURACY.—Stage-discharge relation shifted during high water of 1917. Affected by ice during winter. Rating curve used October 1 to July 21 well defined between 40 and 3,500 second-feet; curve used July 22 to September 30 well defined between 50 and 800 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying the mean daily gage height to rating table. Records good, except for period June 15 to July 21 when, on account of shifting of stage-discharge relation, the records are only fair.

Discharge measurements of Encampment River at Encampment, Wyo., during the year ending Sept. 30, 1917.

JACK CREEK AT MATHESON RANCH, NEAR SARATOGA, WYO.

LOCATION.—About sec. 36, T. 17 N., R. 86 W., at Matheson ranch, 14 miles southwest of Saratoga, in Carbon County. Nearest tributary, North Jack Creek, enters some distance below.

DRAINAGE AREA.—32 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—August 23, 1913, to September 19, 1917.

GAGE.—Vertical staff at left abutment of wagon bridge 1,000 feet below ranch house; read by Miss Kathleen Montgomery. Gage originally 200 feet above present site; moved 800 feet farther upstream August 15, 1915 and used until June 13, 1917. No definite relation between readings on various gages.

DISCHARGE MEASUREMENTS.—Made from wagon bridge or by wading.

ANNEL AND CONTROL.—Channel composed of mud; control 100 feet downstream at small rapids which was practically permanent during 1917. Banks are overflowed at stage of 4.0 feet.

REMES OF DISCHARGE.—Maximum stage recorded during year, 4.3 feet June 11 (discharge, 260 second-feet); minimum discharge probably occurs during winter.

—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

ERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 9 second-feet from Jack Creek above station and 93 second-feet below.

ULATION.—None.

URACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve used October 1 to June 12 well defined between 5 and 100 second-feet; curve used June 13 to September 30 fairly well defined between 10 and 220 second-feet. Gage read to hundredths twice daily. Daily discharge ascered by applying mean daily gage height to rating table. Records good.

harge measurements of Jack Creek at Matheson ranch, near Saratoga, Wyo., during the year ending Sept. 30, 1917.

MEDICINE BOW RIVER NEAR MEDICINE BOW, WYO.

LOCATION.—In sec. 7, T. 20 N., R. 79 W., at private bridge at Johnson's ranch, 14 miles southwest of Medicine Bow, Carbon County. Nearest tributary, Wagonhound Creek, enters 3 miles below.

DRAINAGE AREA.—178 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—June 4, 1911, to November 30, 1912; May 5, 1915, to November 3, 1917. State engineer maintained station at this point during 1913 and 1914.

GAGE.—Vertical staff on downstream side of left abutment; read by Mrs. S. W. Johnson. Gage used during 1911 and 1912 was 600 feet upstream and referred to different datum.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel. Control 75 feet downstream at riffle composed of gravel and small boulders well compacted; shifts occasionally. Banks not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.4 feet at 7.30 a. m. June 23 (discharge, 2,810 second-feet); minimum discharge probably occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 207 second-feet from Medicine Bow River above station and 67 second-feet below.

REGULATION.—None.

ACCURACY.—Stage-discharge relation changed during winter. Rating curve used October 1 to November 11 well defined below 500 second-feet; curve used April 15 to November 3 well defined below 1,300 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records excellent up to 1,300 second-feet; above this they are fair.

Discharge measurements of Medicine Bow River near Medicine Bow, Wyo., during the year ending Sept. 30, 1917.

ROCK CREEK NEAR ARLINGTON, WYO.

LOCATION.—In sec. 25, T. 19 N., R. 79 W., at highway bridge 1½ miles above Arlington, Carbon County. Nearest tributary, Overland Creek, enters half a mile above. Prior to January 12, 1916, station was at Arlington, 1½ miles downstream. Flow at two points practically the same.

DRAINAGE AREA.—70 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—April 22, 1911, to September 30, 1917.

GAGE.—Bristol water-stage recorder on left bank just below bridge.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed rough and composed of coarse gravel and small boulders. Control not well defined. Banks high and not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage during year from water-stage recorder 4.6 feet at 6 p. m. June 21 (discharge, 1,100 second-feet); minimum discharge, 4 second-feet on January 22 and 23.

ICE.—Stage-discharge relation seriously affected by ice; flow estimated from discharge measurements, observer's notes, and temperature records.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated permits for diversion of approximately 4 second-feet from Rock Creek above and 209 second-feet below the station.

REGULATION.—None.

ACCURACY.—Stage-discharge relation shifting during year; shifting-control method used. Gage heights from continuous record. Daily discharge ascertained by applying to rating table mean daily gage height obtained by inspection. Records fair.

Discharge measurements of Rock Creek near Arlington, Wyo., during the year ending Sept. 30, 1917.

DEEP CREEK NEAR ARLINGTON, WYO.

LOCATION.—In sec. 16, T. 17 N., R. 79 W., at outlet of Sand Lake, 12 miles northwest of Arlington, in Carbon County, at an elevation of 10,100 feet. No tributary within several miles.

DRAINAGE AREA.—3.7 square miles (measured on topographic map).

RECORDS AVAILABLE.—July 30, 1914, to September 30, 1917.

GAGE.—Bristol water-stage recorder on left bank just below lake outlet. Prior to October 8, 1915, gage was 160 feet upstream, and referred to different datum.

DISCHARGE MEASUREMENTS.—Made by wading.

CHANNEL AND CONTROL.—Bed composed of coarse gravel well compacted; no well-defined control.

ICE.—Stage-discharge relation not seriously affected by ice.

EXTREMES OF DISCHARGE.—Maximum stage for year from gage-height graph, 3.93 feet at 7 p. m. June 29 (discharge, 116 second-feet); minimum stage, 0.72 foot at 6 p. m. September 12 (discharge, 0.2 second-foot).

DIVERSIONS.—No diversions above.

REGULATION.—Flow regulated naturally by Sand Lake which has an approximate area of 95 acres.

ACCURACY.—Stage-discharge relation practically permanent; not affected by ice. Rating curve well defined below 40 second-feet but not well defined above 40 second-feet. Operation of water-stage recorder satisfactory except for short periods as shown in the footnote to daily-discharge table. Daily discharge ascertained by applying to rating table mean daily gage height determined by inspecting gage-height graph. Records good below 40 second-feet; fair above.

COOPERATION.—Field data furnished by Rock Creek Conservation Co.

Discharge measurements of Deep Creek near Arlington, Wyo., during the year ending Sept. 30, 1917.

MUDDY CREEK NEAR SHIRLEY, WYO.

LOCATION.—In sec. 14, T. 26 N., R. 80 W., at highway bridge near Point of Rocks, 6 miles east of Shirley, in Carbon County. Nearest tributary enters 4 miles above.

DRAINAGE AREA.—67 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—May 6, 1915, to April 15, 1917, when station was discontinued.

GAGE.—Vertical staff on downstream side of left abutment of bridge.

DISCHARGE MEASUREMENTS.—Made from single-span bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of earth; channel very winding and current sluggish, owing to slight slope (0.0011 foot). Principal control practically at gage during low and medium stages, but during high water is at first bend downstream. Left bank subject to overflow at stage about 3.5 feet. Right bank is overflowed at stage 6.6 feet.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 3.2 second-feet from Muddy Creek above station, and 4.8 second-feet below.

REGULATION.—None.

ACCURACY.—Owing to ice gorging in spring during principal high water, records only fair.

COOPERATION.—Assistance furnished by F. H. Richard.

Discharge measurements of Muddy Creek near Shirley, Wyo., during the year ending Sept. 30, 1917.

[Made by H. K. Smith.]

NOTE.—Mean discharge Apr. 8 to 15, 57.4 second-feet; run-off for period, 911 acre-feet.

SAGE CREEK ABOVE PATHFINDER, WYO.

LOCATION.—In sec. 3, T. 26 N., R. 84 W., at footbridge at Vivion's ranch, 25 miles above Pathfinder dam, Carbon County. No tributary between station and mouth 2 miles below.

DRAINAGE AREA.—182 square miles (measured on base map of Wyoming; scale, 1:500,000 map).

RECORDS AVAILABLE.—March 20, 1915, to September 30, 1917.

GAGE.—Vertical staff 5 feet above footbridge at left bank; read by Mrs. Lewis Stillway and J. S. Wolf.

DISCHARGE MEASUREMENTS.—Made from footbridge or by wading.

CHANNEL AND CONTROL.—Bed composed of boulders embedded in sand. Control a short distance below bridge at riffle, which is permanent. Banks will be overflowed at stage of 6.5 feet. Stage of zero flow, 0.9 foot.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 3.9 feet at 6 a. m. April 24 (discharge, 336 second-feet); minimum stage, 1.12 feet at 6 a. m. July 19 (discharge 0.6 second-foot).

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 16 second-feet from Sage Creek, all above the station.

REGULATION.—None.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve well defined below 220 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

Discharge measurements of Sage Creek above Pathfinder, Wyo., during the year ending Sept. 30, 1917.

DEWEESE CREEK NEAR ALCOVA, WYO.

Location.—In sec. 18, T. 27 N., R. 84 W., at Weaver's ranch, near entrance of creek into Pathfinder Reservoir, in Carbon County.

Drainage area.—41 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—March 4 to September 30, 1917.

Diversions.—Prior to December 31, 1916, there were adjudicated diversions of 4.4 second-feet from Deweese Creek above station.

Cooperation.—Complete records furnished by United States Reclamation Service.

SAND CREEK NEAR ALCOVA, WYO.

Location.—About sec. 25, T. 28 N., R. 85 W., at Weaver's ranch, 20 miles southwest of Alcova, in Carbon County. No tributary between station and Pathfinder reservoir, flow line of which is half a mile below.

Drainage area.—70 square miles (measured on base map of Wyoming; scale, 1:500,000 map).

Records available.—April 1, 1915, to September 9, 1917.

Gage.—Vertical staff read by Clarence Burtch.

Diversions.—Prior to December 31, 1916, there were adjudicated diversions of 28 second-feet from Sand Creek, all above the station.

Regulation.—None.

Cooperation.—Complete records furnished by United States Reclamation Service.

SWEETWATER RIVER NEAR ALCOVA, WYO.

Location.—In sec. 17, T. 29 N., R. 86 W., at Schoonmaker's ranch, 27 miles west of Alcova, in Natrona County. Backwater from Pathfinder reservoir comes to a point 5 miles below. Nearest tributary, Dry Creek, enters 6 miles below.

Drainage area.—2,270 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—August 28, 1913, to September 30, 1917.

Gage.—Vertical staff on left bank at old bridge abutment 200 feet above footbridge; read by H. D. Schoonmaker.

DISCHARGE MEASUREMENTS.—Made from footbridge or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel. Control 25 feet downstream at small rapids which change during high water. Banks high and not subject to overflow.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 102 second-feet from Sweetwater River, above station. The original diversions below the station have been done away with by the Pathfinder reservoir.

REGULATION.—None.

COOPERATION.—Complete records furnished by United States Reclamation Service.

Daily discharge, in second feet, of Sweetwater River near Alcova, Wyo., for the year ending Sept. 30, 1917.

HORSE CREEK NEAR ALCOVA, WYO.

LOCATION.—About in sec. 22, T. 30 N., R. 85 W., at highway bridge near Bothw[illegible] ranch, 16 miles west of Alcova, in Natrona County. No tributary betw[illegible] station and Pathfinder reservoir, flow line of which is half a mile below gage.

DRAINAGE AREA.—119 square miles (measured on base map of Wyoming; sc[illegible] 1:500,000).

RECORDS AVAILABLE.—March 23, 1915, to September 30, 1917.

GAGE.—Vertical staff on right bank at lower side of bridge; read by Thomas Igoe.

DISCHARGE MEASUREMENTS.—Made from single-span bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of coarse gravel. Control a short dista[illegible] below gage.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued [illegible] winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of [illegible] second-feet from Horse Creek.

REGULATION.—None.

COOPERATION.—Complete records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of Horse Creek near Alcova, Wyo., for the year endi[illegible] Sept. 30, 1917.

WAGON HOUND CREEK NEAR LA BONTE, WYO.

LOCATION.—Approximately in sec. 16, T. 31 N., R. 71 W., near mouth of creek, at Eastman's ranch, 3 miles east of La Bonte, in Converse County.

DRAINAGE AREA.—145 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—April 11, 1916, to September 30, 1917.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 24 second-feet from Wagon Hound Creek, all above station.

COOPERATION.—Complete records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of Wagon Hound Creek near La Bonte, Wyo., for the year ending Sept. 30, 1917.

NOTE.—Figures have been changed slightly to conform with computation rules of the United States Geological Survey.

LARAMIE RIVER NEAR JELM, WYO.

LOCATION.—In sec. 15, T. 12 N., R. 77 W., at highway bridge at Boswell's ranch a quarter of a mile below Colorado-Wyoming line, 4 miles south of Jelm, in Albany County.

DRAINAGE AREA.—293 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—May 7, 1911, to September 30, 1917. From June 22, 1904, to October 31, 1905, a station was maintained at Decker's ranch, half a mile south of the State line. The records at the two stations are comparable, as no large tributaries or diversions intervene.

GAGE.—Bristol water-stage recorder on downstream side of right bridge abutment.

DISCHARGE MEASUREMENTS.—Made from two-span bridge or by wading.

CHANNEL AND CONTROL.—Channel composed of gravel; control a short distance downstream, slightly shifting. Left bank is overflowed at gage height 3.0 feet. Flow passes through three well-defined, high-stage channels.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 3.92 feet at 8.30 a. m. June 23 (discharge, 3,390 second-feet); minimum discharge occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Court decrees for diversions of 349 second-feet from Laramie River above station and 800 second-feet from tributaries. Of this amount 688 second-feet are for diversion into the Cache La Poudre drainage basin. During 191 11,502 acre-feet were diverted between July 3 and December 1. Also a condition decree not exceeding 1,235 second-feet into the Cache La Poudre basin throug the Laramie-Poudre tunnel. During 1917 tunnel diverted 392 acre-feet betwee August 4 and 25.

REGULATION.—None.

COOPERATION.—Station maintained in cooperation with the State engineer of Col rado, and records published as furnished by that office. Check measuremen made by engineers of the United States Geological Survey.

ACCURACY.—Stage-discharge relation changed slightly during period when gage w not read. Rating curve used October 1–14 well defined between 40 and 2 second-feet; curve used April 24 to September 30 well defined between 40 an 3,000 second-feet. The operation of the water-stage recorder was satisfactor Daily discharge ascertained by applying to rating table mean daily gage heig determined by inspecting the gage-height graph. Records only fair because c the small scale of the Bristol gage-height graph.

LARAMIE RIVER AND PIONEER CANAL NEAR WOODS, WYO.

LOCATION.—In sec. 36, T. 14 N., R. 77 W., at diversion dam for Pioneer canal, 2 miles above Woods post office, Albany County. Nearest important tributary, Fox Creek, enters 3 miles above.

DRAINAGE AREA.—409 square miles (measured on base map of Wyoming; scale, 1:500,000.)

RECORDS AVAILABLE.—April 16, 1912, to September 12, 1917. From 1895 to 1900, and from May 7 to November 11, 1911, a station was maintained at Woods Landing in sec. 11, T. 13 N., R. 77 W. The records are not directly comparable, as Fox Creek enters between and a few small ditches divert water.

GAGE.—Bristol water-stage recorder with its datum at the crest of dam, was moved September 23, 1915, to upper wing wall of head gates, and although actually above canal intake, it still indicates flow over dam as it is the pool formed by diversion dam. Gage originally at left end of dam just below Pioneer canal head gates. Chain gage in Pioneer canal is at Johnson Bridge, 1½ miles below intake; read by Wesley Johnson.

DISCHARGE MEASUREMENTS.—Made from cable 2,000 feet above dam. Measurement of Pioneer canal made at Johnson Bridge and this quantity is subtracted from flow at cable to determine flow at diversion dam.

CHANNEL AND CONTROL.—Channel at gage is pool formed by concrete diversion dam about 2 feet high. Control is dam itself and is permanent. Banks high and will not overflow. Stage of zero flow is 0.00 foot. Bed of canal composed of shale which changes somewhat; control at concrete drop 1 mile downstream.

EXTREMES OF DISCHARGE.—Laramie River: Maximum stage during year from water-stage recorder, 4.4 feet from 8 a. m. to noon June 23 (discharge, 3,310 second-feet); minimum stage recorded (mean for day), 0.08 foot November 6 (discharge, 12 second-feet).

Pioneer canal: Maximum stage recorded, 5.8 feet at 9.20 a. m. June 19 (discharge, 818 second-feet); minimum discharge of about 2 second-feet occurs during winter when gates are closed.

ICE.—Stage-discharge relation seldom affected by ice as crest of dam is kept free from ice.

DIVERSIONS.—By decree of district court dated December 27, 1912, there were adjudicated diversions of about 10 second-feet from Laramie River between the State line and Pioneer dam, exclusive of the Pioneer canal, which has decrees for 282 second-feet.

REGULATION.—None, as pond above dam is too small to have any appreciable effect on flow. Whenever canal head gates are closed the discharge over dam increases.

ACCURACY.—Laramie River station: Stage-discharge relation practically permanent; slightly affected by ice. Rating curve is well defined between 20 and 1,800 second-feet. Operation of the water-stage recorder was satisfactory throughout the year. Daily discharge ascertained by applying to rating table mean daily gage height determined by inspecting gage-height graph.

Pioneer canal station: Stage-discharge relation slightly shifting. Rating curve used October 1 to November 9 well defined between 20 and 100 second-feet, and curve used April 25 to September 30 well defined between 10 and 1,000 second-feet. Gage read to quarter-tenths once or twice daily. Daily discharge ascertained by applying the one daily gage height or the mean of two daily gage heights to the rating table. Records are good except for periods of missing gage height, when they are fair.

Discharge measurements of Laramie River near Woods, Wyo., during the year ending Sept. 30, 1917.

LARAMIE RIVER AT TWO RIVERS, WYO.

Location.—In sec. 5, T. 17 N., R. 74 W., at highway bridge at Two Rivers, Albany County. Nearest tributary, Little Laramie River, enters a quarter of a mile below.

Drainage area.—1,290 square miles (measured on base map of Wyoming; scale 1:500,000).

Records available.—May 6, 1911, to October 31, 1912; October 1, 1913, to August 15, 1917. Station maintained by State engineer during 1913 and 1914.

Gage.—Bristol water-stage recorder on left bank just above bridge. Gage used since 1915 was referred to datum 0.74 foot higher than that of 1912. Gage on left bank 400 feet above bridge used during 1913 and 1914.

Discharge measurements.—Made from bridge or by wading.

Channel and control.—Bed composed of sand and gravel, and is shifting; no well-defined control. Banks are high and not subject to overflow.

Extremes of discharge.—Maximum from water-stage recorder, 6.35 feet on June 22, 25, and 26 (discharge, 2,560 second-feet); minimum probably occurs during winter.

Ice.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

Diversions.—By decree of district court dated December 27, 1912, there were adjudicated diversions of 414 second-feet from Laramie River between this and the station near Woods.

REGULATION.—None.

ACCURACY.—Stage-discharge relation slightly shifting; affected by ice during winter. Rating curve well defined between 20 and 2,600 second-feet. The operation of the water-stage recorder was satisfactory except for a few days, as explained in footnote. Daily discharge ascertained by applying to the rating table the mean daily gage heights determined by inspecting gage-height graph, except for periods April 16 to June 15 and June 23 to August 15, when discharge was computed by indirect method for shifting control. Records good.

Discharge measurements of Laramie River at Two Rivers, Wyo., during the year ending Sept. 30, 1917.

LARAMIE RIVER NEAR LOOKOUT, WYO.

LOCATION.—About sec. 33, T. 21 N., R. 74 W., at steel highway bridge 9 miles northeast of Lookout, Albany County. No important tributary between station and Wheatland reservoir No. 2, a short distance downstream.

DRAINAGE AREA.—2,100 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—April 22, 1915, to August 30, 1917. State engineer maintained station at this point during 1913 and 1914.

Gage.—Bristol water-stage recorder on upstream side of right bridge abutment.

Discharge measurements.—Made from single-span bridge or by wading.

Channel and control.—Bed composed of sand and silt. Control a short distance downstream; shifts slightly at intervals; practically permanent during 1917.

Extremes of discharge.—Maximum stage during year occurred June 26, at a time when recording gage was not in operation; discharge as estimated from flow at other Laramie River stations, 3,100 second-feet. Minimum discharge probably occurs during winter.

Ice.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

Diversions.—By decree of district court dated December 27, 1912, there were adjudicated diversions of 211 second-feet from Laramie River between Two Rivers and Lookout station.

Regulation.—None.

Accuracy.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve used October 1 to 22 well defined between 20 and 100 second-feet; curve used April 17 to September 30 well defined between 20 and 2,800 second-feet. Operation of the water-stage recorder fairly satisfactory except for intervals as explained in footnote. Daily discharge ascertained by applying to the rating tables mean daily gage heights determined by inspecting gage-height graph. Records good, except during periods when there was no gage-height record, when they are fair.

LARAMIE RIVER BELOW McGILL, WYO.

LOCATION.—In sec. 33, T. 23 N., R. 73 W., at J. T. Dodge's ranch, 8 miles below McGill, Albany County. No tributary between station and outlet of Wheatland reservoir No. 2.

DRAINAGE AREA.—2,230 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—May 4, 1916, to September 13, 1917.

GAGE.—Bristol recording gage referred to vertical staff on left abutment of private bridge; read by Mrs. Mary E. Dodge.

DISCHARGE MEASUREMENTS.—Made from single-span bridge or by wading.

CHANNEL AND CONTROL.—Channel composed of coarse gravel; control at small rapids 100 feet downstream, which are apparently permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.6 feet June 26–30 (discharge, 2,860 second-feet); minimum stage occurs during winter, when flow is practically zero due to storage in Wheatland reservoir.

ICE.—No data.

DIVERSIONS.—One small diversion between station and that near Lookout (see "Regulation").

REGULATION.—Flow shows effect of storage in Wheatland reservoir, which has an adjudicated decree for 633 second-feet and a storage capacity of about 110,000 acre-feet. Flow entirely regulated by reservoir, as river passes through it.

ACCURACY.—Stage-discharge relation practically permanent. Rating curve well defined up to 2,600 second-feet. Operation of water-stage recorder fairly satisfactory. Daily discharge ascertained by applying to rating table the mean daily gage height determined by inspecting gage-height graph. Records good.

LARAMIE RIVER AT FORT LARAMIE, WYO.

Location.—At highway bridge in sec. 28, T. 26 N., R. 64 W., at Fort Laramie, in Goshen County. No important tributary between station and mouth, 1½ miles below.

Drainage area.—4,580 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—April 4, 1915, to September 30, 1917.

Gage.—Vertical staff.

Discharge measurements.—Made from highway bridge.

Channel and control.—No data.

Extremes of discharge.—Data not available.

Ice.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

Diversions.—By decree of district court dated December 27, 1912, there are adjudicated diversions of 61 second-feet between station below McGill and Fort Laramie.

Regulation.—(See Laramie River below McGill.)

Cooperation.—Complete records furnished by United States Reclamation Service.

Daily discharge, in second-feet, of Laramie River at Fort Laramie, Wyo., for the year ending Sept. 30, 1917.

LITTLE LARAMIE RIVER NEAR FILMORE, WYO.

LOCATION.—In sec. 9, T. 15 N., R. 77 W., at private bridge at May's ranch, 1½ miles south of Filmore, Albany County. No important tributary between station and junction of North, Middle, and South forks, 4 miles above.

DRAINAGE AREA.—155 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—July 5, 1902, to August 15, 1903; May 14, 1911, to October 31, 1912; April 1, 1915, to September 30, 1917. State engineer maintained station at this point during 1913 and 1914.

GAGE.—Vertical staff on downstream side of left bridge abutment; read by Claude May. Gage used since April 1, 1915, was referred to datum 0.21 foot lower than gage, at same location, used during 1911 and 1912.

DISCHARGE MEASUREMENTS.—Made from single-span bridge or by wading.

CHANNEL AND CONTROL.—Channel composed of coarse gravel and small boulders; shifted slightly during 1917. No well-defined control. During high water there is flow through channel around right end of bridge.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.7 feet at 7 a. m. June 23 and 5 a. m. June 25 (discharge, 1,920 second-feet); minimum stage probably occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 43 second-feet from the Little Laramie above station, and 255 second-feet from tributaries entering above.

REGULATION.—None.

ACCURACY.—Stage-discharge relation not permanent; affected by ice during winter. Rating curve used October 1 to November 7 fairly well defined between 20 and 200 second-feet; curve used April 15 to July 31 well defined between 20 and 1,800 second-feet; shifting-control method used August 1 to September 30. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to the rating table. Records good.

Discharge measurements of Little Laramie River near Filmore, Wyo., during the year ending Sept. 30, 1917.

LITTLE LARAMIE RIVER AT TWO RIVERS, WYO.

LOCATION.—On line between secs. 5 and 6, T. 17 N., R. 74 W., at highway bridge half a mile south of Two Rivers, Albany County. No tributary between station and mouth, half a mile below.

DRAINAGE AREA.—310 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—May 6, 1911, to October 31, 1912; October 1, 1913, to August 18, 1917. State engineer maintained station at this point during 1913 and 1914.

GAGE.—Bristol water-stage recorder at bridge. Gage used during 1913 and 1914 was 400 feet downstream and referred to different datum.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of sand and gravel which is fairly permanent. Control not well defined. Banks not likely to be overflowed, except during extremely high water.

EXTREMES OF DISCHARGE.—Maximum stage during year from water-stage recorder, 6.0 feet at noon June 25 (discharge, 1,390 second-feet); minimum discharge occurs during irrigation season when there is little or no flow for extended periods.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions from Little Laramie River of 422 second-feet between station near Filmore and this station; none below station.

REGULATION.—None.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve well defined below 1,200 second-feet. The operation of the water-stage recorder was satisfactory. Daily discharge ascertained by applying to the rating table the mean daily gage-height determined by inspecting the gage-height graph. Records good.

Discharge measurements of Little Laramie River at Two Rivers, Wyo., during the year ending Sept. 30, 1917.

NORTH LARAMIE RIVER NEAR WHEATLAND, WYO.

LOCATION.—In sec. 2, T. 25 N., R. 70 W., a quarter of a mile above head gate of North Laramie Land Co.'s ditch and 18 miles northwest of Wheatland, Platte County. No important tributary within 10 miles of station.

DRAINAGE AREA.—366 square miles (measured on base map of Wyoming; scale, 1:500,000).

RECORDS AVAILABLE.—November 6, 1914, to Sėptember 30, 1917.

GAGE.—Bristol water-stage recorder at left bank on vertical cliff just below proposed dam site.

DISCHARGE MEASUREMENTS.—Made from cable near gage or by wading.

CHANNEL AND CONTROL.—Channel of sand and gravel. Control 40 feet downstream at rapids which shifted slightly during 1917.

EXTREMES OF DISCHARGE.—Maximum stage during year from water-stage recorder, 4.05 feet June 2 (discharge, 1,270 second-feet); minimum stage probably occurred during winter.

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—Prior to December 31, 1916, there were adjudicated diversions of 37 second-feet from North Laramie River, above station, and 27 second-feet below.

REGULATION.—None.

ACCURACY.—Stage-discharge relation shifts between narrow limits; affected by ice during winter. Rating curve well defined below 1,000 second-feet. Operation of the water-stage recorder was fairly satisfactory except for short intervals as explained in footnote to daily-discharge table. Daily discharge ascertained by applying to rating table the mean daily gage height determined by inspecting gage-height graph, except for periods March 7 to April 20 and June 1 to September 5, when discharge was determined by shifting-control method. Records good up to 1,000 second-feet, above which they are fair.

Discharge measurements of North Laramie River near Wheatland, Wyo., during the year ending Sept. 30, 1917.

CHUGWATER CREEK AT CHUGWATER, WYO.

Location.—In sec. 31, T. 21 N., R. 66 W., 300 feet above highway bridge half a mile from railroad station at Chugwater, Platte County. No tributary within several miles.

Drainage area.—359 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—May 22, 1911, to November 6, 1912; January 1, 1915, to September 30, 1917. State engineer maintained station at this point during 1913 and 1914.

Gage.—Chain gage on left bank 300 feet above bridge, installed April 6, 1916, at same datum and location as vertical staff previously used; read by Artie Allen. Prior to February 6, 1912, gage was on bridge and referred to different datum.

Discharge measurements.—Made from highway bridge or by wading.

Channel and control.—Bed composed of sand which shifted considerably during 1917. Control not well defined. Banks high and not subject to overflow.

Extremes of discharge.—Maximum stage recorded during year, 3.4 feet at 4 p. m. June 1 (discharge, 280 second-feet); minimum stage, 1.06 feet on January 26, 27, 29–31 (discharge, 2.6 second-feet).

Ice.—Stage-discharge relation not affected by ice, except for short periods.

Diversions.—Prior to December 31, 1916, there were adjudicated diversions from Chugwater Creek of 73 second-feet above station, and 98 second-feet below.

Regulation.—None.

Accuracy.—Stage-discharge relation not permanent; not affected by ice during winter. Rating curve used October 1 to December 31 fairly well defined below 200 second-feet, and curve used June 2 to September 30 is faily well defined between 10 and 250 second-feet; shifting-control method used January 1 to June 1. Gage read to hundredths twice daily. Daily discharge ascertained by applying the mean daily gage height to rating table. Records good, except for period May 24 to June 4, when they are only fair because of a decided shift.

Discharge measurements of Chugwater Creek at Chugwater, Wyo., during the year ending Sept. 30, 1917.

HORSE CREEK NEAR LA GRANGE, WYO.

Location.—In SW. ¼ SW. ¼ sec. 34, T. 20 N., R. 61 W., 2 miles southeast of Wye-Cross ranch and 1½ miles northwest of La Grange, Goshen County. Nearest tributary, Bear Creek, enters 2 miles below.

Drainage area.—683 square miles (measured on base map of Wyoming; scale, 1:500,000).

Records available.—November 1, 1915, to September 30, 1917. From December 1, 1911, to December 31, 1912, fragmentary records are available at a point 1½ miles downstream.

Gage.—Gurley water-stage recorder on left bank.

Discharge measurements.—Made from footbridge near gage or by wading.

Channel and control.—Bed composed of coarse gravel which may shift. Control just below station at small rapids; practically permanent during 1917.

Extremes of discharge.—Maximum stage during year from water-stage recorder, 3.2 feet at 1 a. m. June 3 (discharge, 345 second-feet); minimum stage from water-stage recorder, 0.85 foot on October 1, 2, and 3 (discharge, 9 second-feet).

Ice.—Stage-discharge relation not seriously affected by ice except during short periods.

Diversions.—Prior to December 31, 1916, there were adjudicated permits for diversions of 1,163 second-feet from Horse Creek above station, and 71 second-feet below. In addition, there were permits for 2,067 acre-feet storage above, and 5,202 acre-feet below station.

Regulation.—None.

Accuracy.—Stage-discharge relation practically permanent; affected by snow and ice for short periods during winter. Rating curve well defined between 6 and 280 second-feet. Operation of the water-stage recorder was satisfactory throughout year, except for short periods indicated by breaks in record, as shown in footnote to daily-discharge table. Daily discharge ascertained by applying to rating table mean daily gage height determined by inspecting gage-height graph. Records excellent, except for periods affected by ice when they are fair.

Discharge measurements of Horse Creek near La Grange, Wyo., during the year ending Sept. 30, 1917.

SOUTH PLATTE RIVER AT SOUTH PLATTE, COLO.

LOCATION.—In sec. 25, T. 7 S., R. 70 W., 375 feet below point where North Fork of South Platte enters, at South Platte, Jefferson County. No tributary between forks and station.

DRAINAGE AREA.—2,610 square miles (measured on map in Hayden's atlas).

RECORDS AVAILABLE.—March 28, 1902, to September 30, 1917. Records at Platte Canyon and at Deansbury, a few miles below, extend back to 1887, with the exception of 1893 and 1894. The earlier records, 1887–1892, were taken by the State engineer, and records from 1895 to 1896 were taken under direction of the Denver Power & Irrigation Co.

GAGE.—Bristol water-stage recorder on right bank 375 feet below forks; in use since March 14, 1910. From March 28, 1902, to May 7, 1905, the gage was at the highway bridge. On May 7, 1905, gage was moved to its present site 150 feet below bridge. Datum of new gage probably somewhat different. Recording gage is referred to datum of gage established in 1905.

DISCHARGE MEASUREMENTS.—Made from cable near gage or by wading.

CHANNEL AND CONTROL.—Bed composed of coarse sand and fine gravel; shifts. Control 35 feet downstream at well-defined rapids; shifts considerably at times. Banks high and not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage during year from water-stage recorder, 5.4 feet at 8.30 a. m., June 20 (discharge, 2,050 second-feet); minimum discharge occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; monthly mean discharge estimated from records obtained few miles below by Denver Union Water Co.

DIVERSIONS.—No water is diverted between this station and that on the North Fork at South Platte. Above the station there are court decrees for 85,600 and 80,000 acre-feet for Antero and Cheesman reservoirs, respectively, all of which passes the gage before being diverted. In addition to the reservoir decrees, there are decrees for diversions of 1,075 second-feet from South Platte River above station, and 3,326 second-feet from tributaries entering above. Also a decree for storage of 46,000 acre-feet in reservoir located on tributary entering above station.

REGULATION.—Flow regulated to certain extent by Antero and Cheesman reservoirs on the South Platte, 60 and 15 miles, respectively, above the forks.

ACCURACY.—Stage-discharge relation slightly shifting; affected by ice during winter. Rating curve used October 1 to 30 well defined between 75 and 800 second-feet; curve used April 1 to September 30 well defined between 100 and 1,600 second-feet. Water-stage recorder gave satisfactory results except for short periods as explained in the footnotes. Daily discharge ascertained by applying to rating table the mean daily gage height determined by inspecting gage-height graph. Records for October and April to September are good.

Discharge measurements of South Platte River at South Platte, Colo., during the year ending Sept. 30, 1917.

NOTE.—Monthly estimates for November, December, January, February, and March taken from records of Union Water Co.

TARRYALL CREEK NEAR JEFFERSON, COLO.

LOCATION.—In sec. 6, T. 9 S., R. 74 W., at Robbins ranch, 10 miles southwest of Jefferson, Park County. Rock Creek enters half a mile below.

DRAINAGE AREA.—223 square miles (measured on Forest atlas).

RECORDS AVAILABLE.—June 27, 1912, to October 27, 1917. From October 18, 1910, to June 28, 1911, a station was maintained within a quarter of a mile of present site. Relation between the present gage and that used 1910–11 not known.

GAGE.—Vertical staff installed April 22, 1916, on left bank 60 feet above and at same datum as old vertical on left bank opposite ranch house. Difference in gage heights of about 0.4 foot as read on new and old gages is due to fall in stream between them; read by Miss Mary Robbins.

DISCHARGE MEASUREMENTS.—Made from footbridge 400 feet below gage or by wading.

CHANNEL AND CONTROL.—Bed composed of fine gravel. Principal control 150 feet downstream at gravel bar; practically permanent during 1917. Banks subject to overflow at stage of 2.8 feet, and at 3.0 feet the entire bottom for a width of 500 feet is flooded.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.1 feet at 7:15 p. m. July 9 (discharge, 1,320 second-feet); minimum stage, 0.45 foot October 3, 1917. (Discharge, 1.0 second-foot.)

ICE.—Stage-discharge relation seriously affected by ice; observations discontinued during winter.

DIVERSIONS.—There are court decrees for diversions of 314 second-feet from Tarryall Creek above and 220 second-feet below station. The Tarryall Canal and Reservoir Co. has a provisional decree for storage of 68,000 acre-feet from Tarryall and tributaries above station, and a decree for a supply diversion (not yet made) amounting to 450 second-feet. There are decrees for diversions of 926 second-feet from tributaries entering above station. The Boreas ditch diverts a small amount of water from the headwaters of Blue River to Tarryall Creek at its headwaters.

REGULATION.—None.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curves well defined between 10 and 350 second-feet; not well defined above 350 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good up to 350 second-feet, above which they are fair.

Discharge measurements of Tarryall Creek near Jefferson, Colo., during the year ending Sept. 30, 1917.

NORTH FORK OF SOUTH PLATTE RIVER AT GRANT, COLO.

Location.—In sec. 9, T. 7 S., R. 74 W., at Grant, Park County, 250 feet above mouth of Geneva Creek.

Drainage area.—51 square miles (measured on Forest atlas).

Records available.—July 18, 1910, to September 30, 1917.

Gage.—Vertical staff on left bank 250 feet above mouth of Geneva Creek; read by Mrs. M. McFarland.

Discharge measurements.—Made by wading.

Channel and control.—Bed composed of gravel. Principal control about 20 feet below gage at small rapids; shifted during 1917.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 3.18 feet at 6 p.m. June 10 (discharge, 233 second-feet); minimum discharge occurs during winter.

ICE.—Stage-discharge relation serioulsy affected by ice; observations discontinued during winter; discharge measurements made monthly.

DIVERSIONS.—There are court decrees for diversions of 5.5 second-feet from the North Fork above station and 24 second-feet from tributaries entering above.

REGULATION.—None.

ACCURACY.—Stage-discharge relation not permanent; affected by ice during winter. Rating curve fairly well defined below 160 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table, except for period April 1 to September 30, when discharge is computed by shifting-control method. Records fair.

Discharge measurements of North Fork of South Platte River at Grant, Colo., during the year ending Sept. 30, 1917.

NORTH FORK OF SOUTH PLATTE RIVER AT SOUTH PLATTE, COLO.

LOCATION.—In sec. 25, T. 3 S., R. 70 W., one-third of a mile above railroad station at South Platte, Jefferson County. No tributary between station and mouth at South Platte.

DRAINAGE AREA.—449 square miles (measured on map in Hayden's atlas).

RECORDS AVAILABLE.—January 4, 1909, to September 30, 1910; April 1, 1913, to September 30, 1917.

GAGE.—Inclined staff on left bank one-third of a mile above railroad station; read by Mrs. Mata Wallbrecht.

DISCHARGE MEASUREMENTS.—Made from cable 300 feet above gage or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel and sand. Principal control a short distance below gage; shifting between narrow limits. Banks not subject to much overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.8 feet at 8 a. m. June 18 (discharge, 1,300 second-feet); minimum discharge occurs during winter.

ICE.—Stage-discharge relation seriously affected by ice; daily discharge not determined because of insufficient data.

DIVERSIONS.—There are court decrees for diversion of 20 second-feet from North Fork between Grant and South Platte, and 62 second-feet from intervening tributaries, exclusive of Geneva Creek. Small quantities of water are also diverted at various times for several small ice and fish ponds.

REGULATION.—None.

ACCURACY.—Stage-discharge relation slightly shifting; affected by ice during winter. Rating curve used October 1 to November 10 well defined between 25 and 200 second-feet; curve used March 25 to September 30 well defined between 60 and 900 second-feet. Gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table; shifting-control method used October 1 to November 10. Records fair, October 1 to November 10; good, March 25 to September 30.

Discharge measurements of North Fork of South Platte River at South Platte, Colo., during the year ending Sept. 30, 1917.

GENEVA CREEK AT GRANT, COLO.

Location.—In sec. 9, T. 7 S., R. 74 W., just below highway bridge at Grant, Park County, 300 feet above mouth of creek.

Drainage area.—74 square miles (measured on map in Forest atlas).

Records available.—November 3, 1911, to September 30, 1917. From July 5, 1908, to November 3, 1911, a station was maintained at Sullivan's ranch 3 miles above Grant. Except during the spring run-off, the flow at the two points is practically the same.

Gage.—Vertical staff on right bank just below bridge; temporary vertical staff on downstream side of left abutment used November 8, 1916, to May 5, 1917; read by Mrs. M. McFarland.

Discharge measurements.—Made from single-span bridge or by wading.

Channel and control.—Bed composed of coarse gravel. Principal control 50 feet downstream at gravel bar; shifted during high water of 1917. Banks not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 3.1 feet at 6 p. m. June 17 (discharge, 546 second-feet); minimum discharge of 10 second-feet occurred in February, March, and April.

ICE.—Stage-discharge relation seriously affected by ice; flow estimated from discharge measurements, observer's notes, and records of temperature.

DIVERSIONS.—There is a court decree for diversions of 1 second-foot from Geneva Creek above station, and a temporary reservoir decree for 1,490 acre-feet from Geneva and Kerby creeks.

REGULATION.—None.

ACCURACY.—Stage-discharge relation not permanent; affected by ice during winter. Rating curve well defined between 10 and 350 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying to rating table the mean daily gage height, except for period June 10 to August 7, when discharge is computed by shifting-control method. Records excellent, except for high water and period when stage-discharge relation is affected by ice, when they are fair.

Discharge measurements of Geneva Creek at Grant, Colo., during the year ending Sept. 30, 1917.

CLEAR CREEK NEAR GOLDEN, COLO.

Location.—In sec. 6, T. 4 S., R. 70 W., 1,000 feet below head gates of Golden ditch and 2 miles above Golden, in Jefferson County. Only important tributary between station and mouth, Ralston Creek, enters 12 miles below.

Drainage area.—Approximately 380 square miles.

Records available.—December 4, 1908, to December 31, 1909; June 8 to September 24, 1911; January 29, 1912, to September 30, 1917.

Gage.—Lallie water-stage recorder on left bank 1,000 feet below head of Golden ditch.

Discharge measurements.—Made from cable near gage or by wading.

Channel and control.—Bed composed of coarse gravel and small boulders. Principal control 25 feet downstream at rapids; shifts occasionally. Creek flows in canyon; banks not subject to overflow.

Extremes of discharge.—Maximum stage during year from water-stage recorder, 4.8 feet at 4 a. m. June 18 (discharge, 1,670 second-feet); minimum discharge occurs during winter.

Ice.—Stage-discharge relation seriously affected by ice; observations discontinued during winter, except for occasional discharge measurements.

Diversions.—There is a court decree for a diversion of 53 second-feet from the headwaters of Fraser River to the West Fork of Clear Creek, and approximately 570 acre-feet were diverted in 1917 between July 7 and August 25. Above the Golden station there is a court decree for a diversion of 26 second-feet by the Golden ditch. The diversion by this ditch past the Clear Creek gaging station was about 6,000 acre-feet for 1917.

Regulation.—None.

Accuracy.—Stage-discharge relation not permanent; affected by ice during winter. Rating curve used October 1 to November 7 well defined between 50 and 600 second-feet; curve used March 29 to September 30 well defined between 40 and 1,000 second-feet. Operation of the water-stage recorder was satisfactory. Daily discharge ascertained by applying to rating table the mean daily gage height determined by inspecting gage-height graph, except for periods October 1 to November 7, and March 29 to July 31, when discharge was computed by indirect method for shifting control. Records good.

Discharge measurements of Clear Creek near Golden, Colo., during the year ending Sept. 30, 1917.

NOTE.—Determination of discharge for November and December based on temperature records and discharge measurement.

NORTH BOULDER CREEK AT SILVER LAKE, COLO.

LOCATION.—In NW. ¼ sec. 28, T. 1 N., R. 73 W., at outlet of Silver Lake, in Colorado National Forest.

DRAINAGE AREA.—8.7 square miles (measured by special survey).

RECORDS AVAILABLE.—August 20, 1913, to September 30, 1917.

GAGE.—Friez water-stage recorder which indicates head on the weir.

DISCHARGE MEASUREMENTS.—Made by means of standard sharp-crested weir 10 feet long having a low-water section 5 feet long.

DIVERSIONS.—None above station.

REGULATION.—Winter flow increased by storage in Silver Lake (capacity, 1,900 acre-feet).

COOPERATION.—Complete records furnished by city engineer of Boulder.

Daily discharge, in second-feet, of North Boulder Creek at Silver Lake, Colo., for the period Aug. 20, 1913, to Sept. 30, 1917.

SOUTH BOULDER CREEK NEAR ROLLINSVILLE, COLO.

LOCATION.—In sec. 35, T. 1 S., R. 73 W., 1 mile west of Rollinsville, Gilpin County. Nearest important tributary, Jenny Creek, enters 3 miles above.

DRAINAGE AREA.—39 square miles (measured on topographic maps).

RECORDS AVAILABLE.—September 10, 1910, to September 30, 1917.

GAGE.—Vertical staff spiked to tree on left bank, 500 feet above bridge, used since June 2, 1916; vertical staff on downstream side of right abutment used May 8 to June 1, 1916; vertical staff on upstream side of right abutment used prior to May 8, 1916; read by Miss Grace Grant.

DISCHARGE MEASUREMENTS.—Made from two-span bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of coarse gravel and small boulders. Control not well defined; shifts occasionally. Banks not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 2.38 feet at 5 p. m. June 22 (discharge, 432 second-feet); minimum discharge occurs during winter.

ICE.—Stage-discharge relation affected by ice for short periods.

DIVERSIONS.—No court decrees for diversion above station.

REGULATION.—None.

ACCURACY.—Stage-discharge relation slightly shifting; affected by ice during winter. Rating curve used October 1 to December 31 well defined between 15 and 300 second-feet; curve used April 15 to September 30 well defiend between 10 and 350 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

Discharge measurements of South Boulder Creek near Rollinsville, Colo., during the year ending Sept. 30, 1917.

BIG THOMPSON CREEK NEAR DRAKE, COLO.

LOCATION.—In sec. 2, T. 5 N., R. 71 W., at highway bridge No. 7 in Big Thompson Canyon, 200 yards below Loveland dam and 1½ miles east of Drake, in Larimer County. Nearest tributary, North Fork, enters at Drake.

DRAINAGE AREA.—274 square miles (measured on topographic map).

RECORDS.—September 18–30, 1917.

GAGE.—Bristol pressure gage attached to left bridge abutment.

DISCHARGE MEASUREMENTS.—Made from single-span bridge.

CHANNEL AND CONTROL.—Channel is pool in which several feet of silt are deposited and scoured out; control 50 feet downstream at rapids of compact gravel; practically permanent during 1917. Banks not subject to overflow.

ICE.—Stage-discharge relation seriously affected by ice. Winter measurements made at section half a mile upstream.

DIVERSIONS.—Court decrees for diversion of 23 second-feet from river above station and 2,277 second-feet below, also decrees for storage of 81,000 acre-feet below station.

REGULATION.—Alternate melting and freezing of mountain snows during spring causes diurnal fluctuation. No artificial regulation.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during winter. Rating curve well defined between 25 and 650 second-feet. Water-stage recorder gave satisfactory results. Daily discharge ascertained by applying to the rating table mean daily gage height determined by inspecting gage-height graph. Records good.

COOPERATION.—Field data furnished by city of Loveland. Discharge measurement also made by United States Geological Survey.

Discharge measurements of Big Thompson Creek near Drake, Colo., during the year ending Sept. 30, 1917.

KANSAS RIVER BASIN.

REPUBLICAN RIVER AT WAKEFIELD, KANS.

LOCATION.—In NE. ¼ sec. 5, T. 10 S., R. 4 E., at highway bridge 1,000 feet north of Union Pacific Railroad station at Wakefield, Clay County.

DRAINAGE AREA.—Not determined.

RECORDS AVAILABLE.—June 21 to September 30, 1917.

GAGE.—Chain gage bolted to upstream guard timber of highway bridge in center of middle span.

DISCHARGE MEASUREMENTS.—Made from downstream side of highway bridge or by wading.

CHANNEL AND CONTROL.—Bed is sandy and shifting. The river is confined within fairly high banks that are fairly clean of vegetation. At high water the river overflows on left bank and spreads out over entire valley floor a distance of from 2 to 3 miles in width. The right bank is high and is not overflowed at the gage.

EXTREMES OF STAGE.—Maximum stage recorded during the period, 3.4 feet on June 21, 1917; minimum stage, 1.65 feet on September 12 and 17, 1917.

During the flood of June, 1915, the river rose to within a few feet of the bridge floor, which is approximately gage height, 22½ feet, and flooded out the entire valley. Flood stage occurs at 12 feet gage height.

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Flow is affected by regulation by a dam at Clay Center.

ACCURACY.—Gage heights are means of two daily readings.

Data inadequate for determination of discharge.

Discharge measurements of Republican River at Wakefield, Kans., during the year ending Sept. 30, 1917.

KANSAS RIVER AT OGDEN, KANS.

Location.—In SE. ¼ sec. 12, T. 11 S., R. 6 E., at highway bridge three-fourths of a mile southeast of Ogden, Riley County, Kans. Sevenmile Creek enters from north a quarter of a mile upstream; Clark Creek enters from south 2 miles upstream. Smoky Hill and Republican rivers unite near Junction City, 6 miles by direct line (10 miles by river) upstream, to form Kansas River. Camp Funston is at Ogden Flats, along Kansas River 1½ miles upstream.

Drainage area.—Not determined.

Records available.—June 19 to September 30, 1917.

Gage.—Chain gage bolted to upstream landrail of highway bridge in center of span next to right bank; read by Arthur Estes.

Discharge measurements.—Made from downstream side of bridge or by wading.

Channel and control.—Bed composed of sand; control shifting. Stone jetty on right bank about 50 feet downstream from bridge partially controls flow at low water. There are old bridge members in channel below bridge, which are the remains of an old bridge that was washed out.

Extremes of stage.—Maximum stage recorded during period, 9.7 feet on August 17, 1917; minimum stage, 3.8 feet on August 2, 1917. Flood stage occurs at about 21 feet.

Ice.—Discharge affected by ice.

Regulation.—Flow affected somewhat by mill and power regulation on the tributaries of Kansas River.

Accuracy.—Gage heights are means of two daily readings.

Data inadequate for determination of discharge.

Discharge measurements of Kansas River at Ogden, Kans., during the year ending Sept. 30, 1917.

[Made by R. C. Rice.]

KANSAS RIVER AT TOPEKA, KANS.

Location.—At Chicago, Rock Island & Pacific Railroad bridge 2,100 feet upstream from Melan arch highway bridge, at Topeka, Shawnee County. Soldier Creek enters about 1½ miles downstream.

Drainage area.—Not determined.

Records available.—April 24 to August 31, 1904, and June 12 to September 30, 1917.

Gage.—Chain gage bolted to floor beam of second span of railroad bridge, 235 feet out from right abutment on the downstream side; read by T. H. Beeson. Gage set to read the same as the United States Weather Bureau chain gage on Melan arch bridge on June 12, 1917, when the stage there read 9.1 feet, at 1.40 p. m. In 1904 a station was maintained at this point for flood observations. A staff gage was painted on one of the piers of the railroad bridge at an arbitrary datum.

Discharge measurements.—Made from downstream side of railroad bridge.

Channel and control.—Bed composed of sand and silt; the Melan arch bridge and old bridge piles and riprapping under and upstream from it act as an artificial control for the stage-discharge relation. Banks are levied upstream and downstream so that the stream is confined for all stages.

Extremes of discharge.—Maximum stage recorded during period, 9.4 feet on June 12, 1917 (discharge, 12,400 second-feet); minimum stage, 4.3 feet on August 4 and 5, 1917 (discharge, 1,010 second-feet).

Ice.—Discharge affected by ice. Flow from outfall sewers entering Kansas River 500 feet upstream from the Melan arch bridge usually keeps the main channel open at that point.

Regulation.—None, except slight effect of power regulation on tributaries upstream.

Accuracy.—Stage-discharge relation not permanent. Rating curves used June 12 to September 9 and September 10–30 fairly well defined. Gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

Discharge measurements of Kansas River at Topeka, Kans., during the year ending Sept. 30, 1917.

[Made by R. C. Rice.]

KANSAS RIVER AT BONNER SPRINGS, KANS.

Location.—In NW. ¼ sec. 32, T. 11 S., R. 23 E., at highway bridge at Bonner Springs, Wyandotte County. Wolf Creek enters from north just above Atchison, Topeka & Santa Fe Railway bridge, half a mile upstream. Station is 18 miles by river above Kansas City, Mo., and above backwater influence of Missouri River.

Drainage area.—Not determined.

Records available.—July 8 to September 30, 1917.

Gage.—Chain gage bolted to upstream landrail of highway bridge in center of second span from left bank; read by M. E. Kenton.

Discharge measurement.—Made from downstream side of highway bridge.

Channel and control.—Bed composed of sand and gravel; control shifts at high water. Right bank subject to overflow at high stages; left bank high and fairly steep.

Extremes of stage.—Maximum stage recorded during the period, 7.0 feet on August 16, 1917; minimum stage, 3.95 feet on September 23 and 24, 1917.

Ice.—Stage-discharge relation affected by ice.

Regulation.—Flow affected somewhat by mill operation at Lawrence.

Accuracy.—Gage heights are means of two daily readings.

Data inadequate for determination of discharge.

The following measurement was made by R. C. Rice:

July 8, 1917: Gage height, 4.90 feet; discharge, 2,480 second-feet.

Daily gage height, in feet, of Kansas River at Bonner Springs, Kans., for the year ending Sept. 30, 1917.

24	Little Missouri River	do	Highway bridge at Marmarth, S. Dak.	[c] 24.40	11.8
May 15	Greybull River	Big Horn River	Meeteetse, Wyo	3.20	2,350
June 24	do	do	do	3.12	3,080
July 19	Clear Creek	Powder River	Above Piney Creek at Ucross, Wyo.		75
18	do	do	Clearmont, Wyo	2.0	64
24	do	do	do		91
June 15	Camp Creek	North Platte River.	Mouth, sec. 11, T. 11 N., R. 80 W., Colo.		[b] 50
15	Threemile Creek	do	Mouth, sec. 25, T. 12 N., R. 80 W., Colo.		[b] 5
Oct. 24	Cedar Creek	do	Sec. 28, T. 17 N., R. 83 W., Wyo.		2.4
24	South Spring	do	Sec. 31, T. 16 N., R. 84 W., Wyo.		16
11	North Platte River	Platte River	Pathfinder, Wyo	3.10	1,180
30	Bear Creek	South Platte River	Morrison, Colo		28

[a] Canals divert from Teton River and head on north bank between Strabane and Chouteau; canals listed in downstream order, beginning at Strabane.
[b] Estimated.
[c] Distance from reference point to water surface.

INDEX.

STREAM-GAGING STATIONS

AND

PUBLICATIONS RELATING TO WATER RESOURCES

PART VI. MISSOURI RIVER BASIN

STREAM-GAGING STATIONS AND PUBLICATIONS RELATING TO WATER RESOURCES.

INTRODUCTION.

Investigation of water resources by the United States Geological Survey has consisted in large part of measurements of the volume of flow of streams and studies of the conditions affecting that flow, but it has comprised also investigation of such closely allied subjects as irrigation, water storage, water powers, underground waters, and quality of waters. Most of the results of these investigations have been published in the series of water-supply papers, but some have appeared in the monographs, bulletins, professional papers, and annual reports.

The results of stream-flow measurements are now published annually in 12 parts, each part covering an area whose boundaries coincide with natural drainage features as indicated below:

Part I. North Atlantic basins.
II. South Atlantic and eastern Gulf of Mexico basins.
III. Ohio River basin.
IV. St. Lawrence River basin.
V. Upper Mississippi River and Hudson Bay basins.
VI. Missouri River basin.
VII. Lower Mississippi River basin.
VIII. Western Gulf of Mexico basins.
IX. Colorado River basin.
X. Great basin.
XI. Pacific basins in California.
XII. North Pacific slope basins, in three volumes:
A, Pacific slope basins in Washington and upper Columbia River basin.
B, Snake River basin.
C, Lower Columbia River basin and Pacific slope basins in Oregon.

HOW GOVERNMENT REPORTS MAY BE OBTAINED OR CONSULTED.

Water-supply papers and other publications of the United States Geological Survey containing data in regard to the water resources of the United States may be obtained or consulted as indicated below:

1. Copies may be obtained free of charge by applying to the Director of the Geological Survey, Washington, D. C. The edition printed for free distribution is, however, small and is soon exhausted.

2. Copies may be purchased at nominal cost from the Superintendent of Documents, Government Printing Office, Washington, D. C., who will on application furnish lists, giving prices.

3. Sets of the reports may be consulted in the libraries of the principal cities of the United States.

4. Complete sets are available for consultation in the local office of the water-resources branch of the Geological Survey, as follows:

Boston, Mass., 2500 Customhouse.
Albany, N. Y., Room 704 Journal Building.
Harrisburg, Pa., Care of Water Supply Commission.
Asheville, N. C., 32-35 Broadway.
Chattanooga, Tenn., Temple Court Building.
Madison, Wis., care of Railroad Commission of Wisconsin.
Chicago, Ill., 1404 Kimball Building.
Ames, Iowa, care of State Highway Commission.
Topeka, Kans., 23 Federal Building.
Helena, Mont., Montana National Bank Building.
Denver, Colo., 403 New Post Office Building.
Salt Lake City, Utah, 421 Federal Building.
Boise, Idaho, 615 Idaho Building.
Idaho Falls, Idaho, 228 Federal Building.
Tacoma, Wash., 406 Federal Building.
Portland, Oreg., 606 Post Office Building.
San Francisco, Calif., 328 Customhouse.
Los Angeles, Calif., 619 Federal Building.
Austin, Tex., Capitol Building.
Honolulu, Hawaii, 14 Capitol Building.

A list of the Geological Survey's publications may be obtained by applying to the Director, United States Geological Survey, Washington, D. C.

STREAM-FLOW REPORTS.

Stream-flow records have been obtained at more than 4,240 points in the United States, and the data obtained have been published in the reports tabulated below:

Stream-flow data in reports of the United States Geological Survey.

[A=Annual Report; B=Bulletin; W=Water-Supply Paper.]

Report.	Character of data.	Year.
10th A, pt. 2	Descriptive information only	
11th A, pt. 2	Monthly discharge and descriptive information	1884 to Sept., 1890.
12th A, pt. 2	....do	1884 to June 30, 1891.
13th A, pt. 3	Mean discharge in second-feet	1884 to Dec. 31, 1892.
14th A, pt. 2	Monthly discharge (long-time records, 1871 to 1893)	1888 to Dec. 31, 1893.
B 131	Descriptions, measurements, gage heights, and ratings	1893 and 1894.
16th A, pt. 2	Descriptive information only	
B 140	Descriptions, measurements, gage heights, ratings, and monthly discharge (also many data covering earlier years).	1895.
W 11	Gage heights (also gage heights for earlier years)	1896.
18th A, pt. 4	Descriptions, measurements, ratings, and monthly discharge (also similar data for some earlier years).	1895 and 1896.
W 15	Descriptions, measurements, and gage heights, eastern United States, eastern Mississippi River, and Missouri River above junction with Kansas.	1897.

Stream-flow data in reports of the United States Geological Survey—Continued.

Report.	Character of data.	Year.
W 16	Descriptions, measurements, and gage heights, western Mississippi River below junction of Missouri and Platte, and western United States.	1897.
19th A, pt. 4	Descriptions, measurements, ratings, and monthly discharge (also some long-time records).	1897.
W 27	Measurements, ratings, and gage heights, eastern United States, eastern Mississippi River, and Missouri River.	1898.
W 28	Measurements, ratings, and gage heights, Arkansas River, and western United States.	1898.
20th A, pt. 4	Monthly discharge (also for many earlier years)	1898.
W 35 to 39	Descriptions, measurements, gage heights, and ratings	1899.
21st A, pt. 4	Monthly discharge	1899.
W 47 to 52	Descriptions, measurements, gage heights, and ratings	1900.
22d A, pt. 4	Monthly discharge	1900.
W 65, 66	Descriptions, measurements, gage heights, and ratings	1901.
W 75	Monthly discharge	1901.
W 82 to 85	Complete data	1902.
W 97 to 100	.....do	1903.
W 124 to 135	.....do	1904.
W 165 to 178	.....do	1905.
W 201 to 214	.....do	1906.
W 241 to 252	.....do	1907-8.
W 261 to 272	.....do	1909.
W 281 to 292	.....do	1910.
W 301 to 312	.....do	1911.
W 321 to 332	.....do	1912.
W 351 to 362	.....do	1913.
W 381 to 394	.....do	1914.
W 401 to 414	.....do	1915.
W 431 to 444	.....do	1916.
W 451 to 464	.....do	1917.

NOTE.—No data regarding stream flow are given in the 15th and 17th annual reports.

The records at most of the stations discussed in these reports extend over a series of years, and miscellaneous measurements at many points other than regular gaging stations have been made each year. An index of the reports containing records obtained prior to 1904 has been published in Water-Supply Paper 119.

The following table gives by years and drainage basins the numbers of the papers on surface-water supply published from 1899 to 1917. The data for any particular station will in general be found in the reports covering the years during which the station was maintained. For example, data from 1902 to 1917, for any station in the area covered by Part III are published in Water-Supply Papers 83, 98, 128, 169, 205, 243, 263, 283, 303, 323, 353, 383, 403, 433, and 453, which contain records for the Ohio River basin for those years.

Numbers of water-supply papers containing results of stream measurements, 1899–1917.

a Rating tables and index to Water-Supply Papers 35–39 contained in Water-Supply Paper 39. Tables of monthly discharge for 1899 in Twenty-first Annual Report, Part IV.
b James River only.
c Gallatin River.
d Green and Gunnison rivers and Grand River above junction with Gunnison.
e Mohave River only.
f Kings and Kern rivers and south Pacific slope basins.
g Rating tables and index to Water-Supply Papers 47–52 and data on precipitation, wells, and irrigation in California and Utah contained in Water-Supply Paper 52. Tables of monthly discharge for 1900 in Twenty-second Annual Report, Part IV.
h Wissahickon and Schuylkill rivers to James River.
i Scioto River.
j Loup and Platte rivers near Columbus, Nebr., and all tributaries below junction with Platte.
k Tributaries of Mississippi from east.
l Lake Ontario and tributaries to St. Lawrence River proper.
m Hudson Bay only.
n New England rivers only.
o Hudson River to Delaware River, inclusive.
p Susquehanna River to Yadkin River, inclusive.
q Platte and Kansas rivers.
r Great Basin in California, except Truckee and Carson river basins.
s Below junction with Gila.
t Rogue, Umpqua, and Siletz rivers only.

In these papers and in the following lists the stations are arranged in downstream order. The main stem of any river is determined by measuring or estimating its drainage area—that is, the headwater stream having the largest drainage area is considered the continuation of the main stream, and local changes in name and lake surface are disregarded. All stations from the source to the mouth of the main stem of the river are presented first, and the tributaries in regular order from source to mouth follow, the streams in each tributary basin being listed before those of the next basin below.

In exception to this rule the records for Mississippi River are given in four parts, as indicated on page III, and the records for large lakes are presented in order of streams around the rim of the lake.

PART VI. MISSOURI RIVER BASIN.

PRINCIPAL STREAMS.

The principal streams in the Missouri River basin are Red Rock Creek and Beaverhead and Jefferson rivers, which may be considered a continuous river forming the head of the Missouri; and, below the mouth of the Jefferson, Madison, Gallatin, Prickly Pear, Little Prickly Pear, Dearborn, Sun, Marias, Judith, Musselshell, Milk, Yellowstone, Muddy, Little Missouri, Cheyenne, Niobrara, Platte (including North Platte and South Platte), Kansas, Osage (Marias des Cygnes), and Gasconade rivers. These streams drain wholly or in part the States of Colorado, Iowa, Kansas, Minnesota, Missouri, Montana, Nebraska, North Dakota, South Dakota, and Wyoming.

In addition to the annotated list of publications relating specifically to the section, these pages contain a similar list of reports that are of general interest in many sections and cover a wide range of hydrologic subjects, and also brief references to reports published by State and other organizations. (See p. XXVIII.)

GAGING STATIONS.

NOTE.—Dash after a date indicates that station was being maintained September 30, 1917; period after a date indicates discontinuance. Tributaries are shown by indention.

Red Rock Creek (head of Missouri River) above Red Rock reservoir, near Monida, Mont., 1911; 1914–15.
Red Rock Creek below Red Rock reservoir, near Monida, Mont., 1911–
Red Rock Creek at Lima, Mont., 1907–1911.
Red Rock Creek at Red Rock, Mont., 1890.
Beaverhead River (continuation of Red Rock Creek) at Barratts, Mont., 1907–
Beaverhead River at Dillon, Mont., 1907.
Jefferson River (continuation of Red Rock-Beaverhead River) near Silverstar, Mont., 1910–1916.
Jefferson River at Sappington, Mont., 1894–1905.
Missouri River at Toston, Mont., 1890; 1910–1916.
Missouri River near Townsend, Mont., 1891–1901; 1903–4.
Missouri River at Canyon Ferry, Mont., 1889.
Missouri River near Craig, Mont., 1890–1892.
Missouri River at Cascade, Mont., 1902–1915.
Missouri River at Great Falls, Mont., 1897–1905.
Missouri River at Fort Benton, Mont., 1910–
Missouri River near Williston, N. Dak., 1905–1907.
Missouri River at Mannhaven, N. Dak., 1904.
Missouri River at Washburn, N. Dak., 1905.
Missouri River at Bismarck, N. Dak., 1904–5.
Missouri River at Kansas City, Mo., 1905–6.

Missouri River tributaries:
- Passamari River [Ruby Creek] near Alder, Mont., 1911–1914.
- Bighole River near Dewey, Mont., 1910–1913.
- Big pipestone Creek near Whitehall, Mont., 1910–11.
- Whitetail Creek near Whitehall, Mont., 1911.
  - Little Whitetail Creek near Whitehall, Mont., 1911.
- Boulder River.
  - Muskrat Creek near Boulder, Mont., 1912–1914.
- Gibbon River (head of Madison River) near Yellowstone, Mont., 1913–1916.
- Madison River near Yellowstone, Mont., 1913–
- Madison River near Norris, Mont., 1897–1905; 1910.
- Madison River near Red Bluff, Mont., 1890–1894; 1897–1902.
- Madison River near Three Forks, Mont., 1893–1897.
- Gallatin River near Salesville, Mont., 1895–1905; 1910–1913.
- Gallatin River near Bozeman, Mont., 1889–1891.
- Gallatin River at Logan, Mont., 1893–1905.
  - Middle Creek near Bozeman, Mont., 1895–96; 1898–1900; 1902–3.
- Crow Creek near Townsend, Mont., 1912–13.
- Crow Creek near Radersburg, Mont., 1901.
- Deep Creek near Townsend, Mont., 1910–1915.
- Prickly Pear Creek near Clancy, Mont., 1908–1916.
- Prickly Pear Creek at East Helena, Mont., 1908–1913.
  - Lump Gulch Creek near Clancy, Mont., 1908–1913.
  - Tenmile Creek near Rimini, Mont., 1915–
  - Tenmile Creek near Helena, Mont., 1908–
    - Sevenmile Creek at Birdseye, Mont., 1908–1913.
- Little Prickly Pear Creek near Marysville, Mont., 1909–1911; 1913–
- Little Prickly Pear Creek near Cayon Creek, Mont., 1909–1911; 1913–
  - Lost Horse Creek near Marysville, Mont., 1909–1911.
  - Marsh Creek near Marysville, Mont., 1909–1911.
  - Deadman Creek near Marysville, Mont., 1909–1911.
- Dearborn River near Clemons, Mont., 1908–1911.
  - Falls Creek near Clemons, Mont., 1908–1911.
- Smith River at Truly, Mont., 1905–1907.
- Sun River, North Fork of North Fork (head of Sun River), near Augusta, Mont., 1911–12.
- Sun River, North Fork, near Augusta,[1] Mont., 1889–90; 1903–
- Sun River at Fort Shaw, Mont., 1912–
- Sun River at Sun River, Mont., 1905–1912.
- Sun River near Great Falls, Mont., 1897.
  - South Fork of North Fork of Sun River near Augusta, Mont., 1911–12.
  - Floweree Big canal near Fort Shaw, Mont., 1912.
  - Willow Creek near Augusta, Mont., 1905–1911; 1912–
  - South Fork of Sun River at Augusta, Mont., 1904–
    - Smith Creek near Augusta, Mont., 1906–1912.
      - Ford Creek near Augusta, Mont., 1906–1912.
  - Crown Butte canal at Riebling, Mont., 1912.
  - Crown Butte canal near Simms, Mont., 1912.
  - Sun River canal near Sun River, Mont., 1912.
  - Sun River canal at Vaughn, Mont., 1912.

[1] Records for 1889–90 published at Sun River above Augusta, Mont.

Missouri River tributaries—Continued.
- Belt Creek near Belt, Mont., 1905–6.
- Highwood Creek near Highwood, Mont., 1905–6.
- Two Medicine River (head of Marias River) near Midvale, Mont., 1902–3.
- Two Medicine River at Family, Mont., 1907–
- Marias River near Shelby, Mont., 1902–1908; 1911–.
  - Badger Creek near Family, Mont., 1907–
  - Birch Creek at Swift dam, near Dupuyer, Mont., 1913–
  - Birch Creek near Dupuyer, Mont., 1907–
  - Birch Creek at Nelson's ranch, near Dupuyer, Mont., 1914–
  - Birch Creek at Hall's ranch, near Dupuyer, Mont., 1913–1916.
  - Birch Creek at Robare, Mont., 1914–
    - Dupuyer Creek at Dupuyer, Mont., 1908–1912.
    - Dupuyer Creek near Valier, Mont., 1912–
  - Cut Bank Creek at Cut Bank, Mont., 1905–
  - Dry Fork of Marias River near Valier, Mont., 1911–1915.
  - Teton River at Strabane, near Belleview, Mont., 1904–1906; 1908–
  - Teton River near Chouteau, Mont., 1904–1906; 1913; 1915–
  - Spring Creek near Strabane, Mont., 1913; 1917–
  - Spring Creek near Chouteau, Mont., 1917–
    - Deep Creek at Frazier's ranch, near Chouteau, Mont., 1912.
    - Deep Creek near Chouteau, Mont., 1911–
      - Willow Creek near Chouteau, Mont., 1912–
  - Muddy Creek near Bynum, Mont., 1912–
  - Muddy Creek near Agawam, Mont., 1917.
    - Blackleaf Creek near Bynum, Mont., 1912–
- Judith River near Lewistown, Mont., 1910.
- Musselshell River, North Fork (head of Musselshell River), near Delpine, Mont., 1909–1911.
- Musselshell River, North Fork, near Martinsdale, Mont., 1907–1914.
- Musselshell River at Harlowtown, Mont., 1907–
- Musselshell River at Shawmut, Mont., 1902–1907.
- Musselshell River at Lavina, Mont., 1906.
  - Checkerboard Creek near Delpine, Mont., 1909–1911; 1913–14.
  - South Fork of Musselshell River near Martinsdale, Mont., 1907–1914.
  - American Fork near Harlowton, Mont., 1907–1911; 1913.
    - Lebo Creek near Harlowton, Mont., 1907–1911; 1913.
  - Boxelder Creek:
    - Flatwillow Creek near Flatwillow, Mont., 1911–
- Milk River, South Fork (head of Milk River), near international boundary, 1905–
- Milk River at eastern crossing [international boundary], 1913–
- Milk River at Havre, Mont., 1898–
- Milk River at Chinook, Mont., 1897.
- Milk River at Malta, Mont., 1902–
- Milk River at Hinsdale, Mont., 1908–1914.
- Milk River near Vandalia, Mont., 1915–
  - North Fork of Milk River near Browning, Mont., 1911–12.
  - North Fork of Milk River near international boundary [Kimball, Alberta], 1913–
  - Fort Belknap canal near Chinook, Mont., 1903–
  - Winter-Anderson canal near Chinook, Mont., 1906; 1908.
  - Lodge Creek at international boundary, 1917–

- Missouri River tributaries—Continued.
  - Milk River tributaries—Continued.
    - Lodge Creek[1] at Chinook, Mont., 1906–1908.
      - Reser ditch near Chinook, Mont., 1905–6.
      - West Fork ditch near Chinook, Mont., 1905–6.
    - Battle Creek at international boundary, 1917–
    - Battle Creek[2] near Chinook, Mont., 1905–
      - Cook canal near Chinook, Mont., 1905–
      - Matheson canal near Chinook, Mont., 1905–
    - Paradise Valley canal near Chinook, Mont., 1903–
    - Harlem canal near Zurich, Mont., 1903–
    - Agency ditch near Harlem, Mont., 1905–
    - Frenchman Creek near international boundary, 1917–
    - Beaver Creek near Malta, Mont., 1917–
    - Beaver Creek overflow near Bowdoin, Mont., 1903–1906; 1908–1912.
    - Beaver Creek near Saco (Ashfield), Mont., 1903–1906; 1908–1912.
    - Rock Creek near Hinsdale, Mont., 1905–1907; 1912–
      - Rock Creek canal near Hinsdale, Mont., 1905–1907.
    - Porcupine Creek at Nashua, Mont., 1908–
  - Little Porcupine Creek near Frazer, Mont., 1908–1916.
  - Wolf Creek near Wolf Point, Mont., 1908–1914.
    - Wolf Point ditch at Wolf Point, Mont., 1909.
  - Poplar River near Poplar, Mont., 1908–
  - Big Muddy Creek near Culbertson, Mont., 1908–
  - Yellowstone River near Canyon Hotel, Yellowstone National Park, 1913–
  - Yellowstone River at Corwin Springs, Mont., 1910–
  - Yellowstone River near Horr, Mont., 1889–1893.
  - Yellowstone River at Livingston, Mont., 1897–1905.
  - Yellowstone River at Billings, Mont., 1904–5.
  - Yellowstone River at Huntley, Mont., 1907–1916.
  - Yellowstone River at Junction, Mont., 1906–7.
  - Yellowstone River near Glendive, Mont., 1897–1910.
  - Yellowstone River at Intake, Mont., 1911–
    - Big Timber Creek, North Fork (head of Big Timber Creek), near Big Timber, Mont., 1907–1911.
    - Big Timber Creek near Big Timber, Mont.;, 1912–
      - South Fork of Big Timber Creek near Big Timber, Mont., 1907–1911.
    - Boulder River near Contact, Mont., 1910–1916.
    - Boulder River near McLeod, Mont., 1912–1914.
      - East Fork of Boulder River near McLeod, Mont., 1907–1909.
      - West Fork of Boulder River near Bruffeys, Mont., 1904–1910.
      - West Fork of Boulder River at McLeod, Mont., 1907–1914.
    - Sweetgrass Creek above Melville, Mont., 1907–
    - Sweetgrass Creek below Melville, Mont., 1907–
    - Stillwater River near Nye, Mont., 1911–1913.
    - Stillwater River near Absarokee, Mont., 1910–1914.
      - Woodbine Creek near Nye, Mont., 1911–1913.
      - Rosebud Creek at Absarokee, Mont., 1910–1914.
    - Clark Fork at Fromberg, Mont., 1905–1913.
    - Pryor Creek at Coburn, Mont., 1911–
    - Pryor Creek at Huntley, Mont., 1904–1916.
    - Wind River (head of Big Horn River) at Dubois, Wyo., 1910–1912.
    - Wind River near Wind River, Wyo., 1909.

[1] Formerly called West Fork of Milk River. [2] Formerly called North Fork of Milk River.

- Missouri River tributaries—Continued.
  - Yellowstone River tributaries—Continued.
    - Powder River tributaries—Continued.
      - Clear Creek near Arvada, Wyo., 1915–
        - Piney Creek at Kearney, Wyo., 1902–1906; 1911–12; 1915–1917.
        - Piney Creek at Ucross, Wyo., 1917–
          - Cruez ditch near Story, Wyo., 1903.
  - Muddy River near Williston, N. Dak., 1904–1909.
  - Little Missouri at Alzada, Mont., 1904–1906.
  - Little Missouri River near Alzada, Mont., 1911–
  - Little Missouri River at Camp Crook, S. Dak., 1903–1906.
  - Little Missouri River at Medora, N. Dak., 1903–1908.
  - Knife River near Broncho, N. Dak., 1903–
  - Painted Woods Creek near Washburn, N. Dak., 1909–10.
    - Turtle Creek near Washburn, N. Dak., 1909–10.
  - Heart River near Richardton, N. Dak., 1903–
  - Apple Creek near Bismarck, N. Dak., 1905.
  - Cannonball River at Stevenson, N. Dak., 1903–1908; 1911–
  - Grand River, North Branch (head of Grand River), at Haley, N. Dak., 1908–1917.
  - Grand River near Seim, S. Dak., 1904–1906.
  - Grand River near Wakpala, S. Dak., 1911–
  - Moreau [Owl] River near Bixby, S. Dak., 1904–1906.
  - Cheyenne River at Edgemont, S. Dak., 1903–1906.
  - Cheyenne River near Hot Springs [Cascade Springs], S. Dak., 1914–
  - Cheyenne River near Wasta, S. Dak., 1914–15.
    - Beaver Creek near Edgemont, S. Dak., 1905–6.
    - Hat Creek near Edgemont, S. Dak., 1905–6.
    - Battle Creek near Hermosa, S. Dak., 1903.
    - Spring Creek near Rapid, S. Dak., 1903–1905.
    - Rapid Creek at Big Bend, S. Dak., 1915–1917.
    - Rapid Creek at Rapid, S. Dak., 1903–1906.
    - Boxelder Creek at Blackhawk, S. Dak., 1903–1905.
      - Corbin-Morse ditch at Rapid, S. Dak., 1906.
    - Elk Creek near Piedmont, S. Dak., 1903.
    - Belle Fourche River at Belle Fourche, S. Dak., 1903–1906.
    - Belle Fourche River near Belle Fourche, S. Dak., 1906; 1912–
      - Redwater River near Minnesela, S. Dak., 1903.
      - Redwater River at Belle Fourche, S. Dak., 1903–1906.
        - Spearfish Creek near Spearfish, S. Dak., 1903–1906.
        - Redwater ditch at Minnesela, S. Dak., 1904–1906.
      - Crow Creek near Belle Fourche, S. Dak., 1904.
      - Owl Creek near Belle Fourche, S. Dak., 1904.
      - Indian Creek near Belle Fourche, S. Dak., 1904.
  - White River at Crawford, Nebr., 1897.
  - White River near Interior, S. Dak., 1904–1906; 1911–
  - White River near Westover, S. Dak., 1911–
    - South Fork of White River near Westover, S. Dak., 1912–
  - Niobrara River near Valentine (Fort Niobrara), Nebr., 1897; 1899; 1901–1906.
  - Niobrara River near Spencer, Nebr., 1908.
  - Niobrara River near Lynch, Nebr., 1913–1915.
  - Niobrara River at Niobrara, Nebr., 1902; 1910–1913.
    - Red Deer Lake (on Plum Creek) near Woodlake, Nebr., 1904–5.
  - James River near Lamoure, N. Dak., 1903.

Missouri River tributaries—Continued.
- Big Sioux River near Watertown, S. Dak., 1900–1903.
- Big Sioux River near Sioux Falls, S. Dak., 1900–1901.
  - Rock River at Luverne, Minn., 1911–1914.
- Grizzly Creek, continuation of Colorado Creek (head of North Platte River) near Hebron, Colo., 1904–5.
- North Platte River near North Gate, Colo., 1915–
- North Platte River near Hebron, Colo., 1904–5.
- North Platte River near Cowdrey, Colo., 1904–5.
- North Platte River near Pinkhampton, Colo., 1904.
- North Platte River at Saratoga, Wyo., 1903–1906; 1909; 1911–12; 1915–
- North Platte River above Pathfinder, Wyo., 1913–
- North Platte River at Pathfinder, Wyo., 1905–
- North Platte River at Alcova., Wyo., 1904–5.
- North Platte River near Casper, Wyo., 1917–
- North Platte River near Douglas, Wyo., 1894.
- North Platte River near Orin Junction, Wyo., 1894–1900.
- North Platte River at McKinley, Wyo., 1917–
- North Platte River at Guernsey, Wyo., 1900–1908; 1912.
- North Platte River above and below Whalen, Wyo.,[1] 1909–
- North Platte River near Fort Laramie, Wyo., 1887–1890.
- North Platte River at Henry, Nebr., 1912–1916.
- North Platte River near Mitchell, Nebr., 1901–1913.
- North Platte River at Scottsbluff, Nebr., 1912,
- North Platte River near Gering, Nebr., 1897–1900.
- North Platte River near Camp Clark, Nebr., 1896–1900.
- North Platte River at Bridgeport, Nebr., 1902–1906; 1915.
- North Platte River at North Platte, Nebr., 1895–1915.
- Platte River near Lexington, Nebr., 1902–1906.
- Platte River near Elm Creek, Nebr., 1914–15.
- Platte River near Columbus, Nebr., 1895–1915.
- Platte River near Fremont. Nebr., 1913–1915.
- Platte River near Leshara, Nebr., 1911–1913.
- Platte River near South Bend, Nebr., 1903.
  - Little Grizzly Creek at Hebron, Colo., 1904–5.
  - Roaring Fork of North Platte River near Hebron, Colo., 1904–5.
  - North Fork of North Platte River at Higho, Colo., 1904–5.
  - Middle Fork of North Platte River:
    - Michigan Creek near Walden, Colo., 1904–5.
    - Michigan Creek near Cowdrey, Colo., 1904–5.
  - Canadian River at Cowdrey, Colo., 1904–5.
  - Douglas Creek near Keystone, Wyo., 1912; 1914–1916.
  - Mullen Creek near French, Wyo., 1911.
  - Big Creek near Big Creek (Downington), Wyo., 1911–12; 1915–
  - French Creek near French, Wyo., 1911–12; 1915–
  - Brush Creek near Saratoga, Wyo., 1911–12; 1915.
  - Encampment River near Peryam's ranch, Wyo., 1900.
  - Encampment River at Encampment, Wyo., 1911–12; 1915–
  - Cow Creek near Saratoga, Wyo., 1911–12.
  - Spring Creek near Saratoga, Wyo., 1911–12.
    - North Spring Creek near Saratoga, Wyo., 1913–1915.
  - Jack Creek at Matheson's ranch, near Saratoga, Wyo., 1913–1917.
  - Jack Creek at Blydenburg's ranch, near Saratoga, Wyo., 1912.

[1] Formerly North Platte River and Interstate canal at Whalen, Wyo.

Missouri River tributaries—Continued.
  Platte River tributaries—Continued.
    Jack Creek at Burdick's ranch, near Saratoga, Wyo., 1911–12.
    Pass Creek near Walcott, Wyo., 1911.
    Medicine Bow River near Medicine Bow, Wyo., 1901; 1911–12; 1915–1917.
      Rock Creek near Arlington, Wyo., 1911–
      Rock Creek near Rock River, Wyo., 1911–12.
        Deep Creek near Arlington, Wyo., 1914–
      Little Medicine Bow River:
        Muddy Creek near Shirley, Wyo., 1915–1917.
    Sage Creek above Pathfinder reservoir, Wyo., 1915–
    Deweese Creek near Alcova, Wyo., 1917–
    Sand Creek above Alcova, Wyo., 1915–
    Sweetwater River near Splitrock, Wyo., 1902–3.
    Sweetwater River near Alcova, Wyo., 1913–
      Horse Creek near Alcova, Wyo., 1915–
    Canyon Creek near Alcova, Wyo., 1915–
    Bates Creek near Casper, Wyo., 1916–
    Deer Creek at Glenrock, Wyo., 1916–
    Boxelder Creek near Careyhurst, Wyo., 1911; 1916–
    La Prele Creek near Fetterman, Wyo., 1916.
    Wagon Hound Creek near La Bonte, Wyo., 1916–
    La Bonte Creek near La Bonte, Wyo., 1916–
    Horseshoe Creek near Glendo, Wyo., 1916–
    Cottonwood Creek near Wendover, Wyo., 1916–
    Laramie River at Glendevey, Colo., 1904–5; 1910–1913; 1916.
    Laramie River near Jelm, Wyo., 1904–5; 1911–
    Laramie River near Woods Landing, Wyo., 1895–1900; 1911.
    Laramie River and Pioneer canal near Woods, Wyo., 1912; 1914–
    Laramie River at Two Rivers, Wyo., 1911–
    Laramie River near Lookout, Wyo., 1915–1917.
    Laramie River at McGill, Wyo., 1915.
    Laramie River below McGill, Wyo., 1916–1917.
    Laramie River near Wheatland, Wyo., 1912; 1915–16.
    Laramie River near Uva, Wyo., 1895–1900; 1903.
    Laramie River at Fort Laramie, Wyo., 1915–
      McIntyre Creek near Gleneyre, Colo., 1904–5.
      Little Laramie River near Hatton, Wyo., 1902–3.
      Little Laramie River near Filmore, Wyo., 1911–12; 1915–
      Little Laramie River near Laramie, Wyo., 1903.
      Little Laramie River at Two Rivers, Wyo., 1911–
      Sibylee Creek near Wheatland, Wyo., 1912; 1915–16.
      North Laramie River near Wheatland, Wyo., 1912; 1914–
      North Laramie River at Uva, Wyo., 1911–12.
      Chugwater Creek at Chugwater, Wyo., 1911–12; 1915–
    Horse Creek near Little Horse Creek, Wyo., 1911–12.
    Horse Creek near La Grange, Wyo., 1911–12; 1915–
    Birdwood Creek near Sutherland, Nebr., 1913–1915.
    South Platte River at Lake George, Colo., 1910–1915.
    South Platte River at Cheeseman Lake, Colo., 1899; 1901.
    South Platte River above North Fork, at South Platte, Colo., 1905–1912.
    South Platte River at South Platte, Colo., 1902–
    South Platte River near Deansbury (Platte Canyon), Colo., 1887–1892; 1895–1900; 1903.

Missouri River tributaries—Continued.
  Platte River tributaries—Continued.
    South Platte River at Denver, Colo., 1895–1906; 1909–1913.
    South Platte River near Kersey, Colo., 1901–1903; 1905–1913.
    South Platte River near Orchard, Colo., 1895–1900.
    South Platte River at Julesburg, Colo., 1902–1906; 1908–1914.
    South Platte River near Big Spring, Nebr., 1902–3.
    South Platte River at North Platte, Nebr., 1914–1915.
      Little South Platte River near Fairplay, Colo., 1916.
      Middle Fork of South Platte River at Alma, Colo., 1916.
      Middle Fork of South Platte River at Fairplay, Colo., 1910–1912; 1916.
      Tarryall Creek near Como, Colo., 1911–12.
      Tarryall Creek near Jefferson, Colo., 1910–1917.
      Tarryall Creek near Hayman, Colo., 1910–1912.
        Jefferson Creek at Jefferson, Colo., 1910–1912.
          Michigan Creek near Jefferson, Colo., 1910–1912.
        Rock Creek near Jefferson, Colo., 1916.
      Goose Creek near Cheeseman Lake, Colo., 1899.
      North Fork of South Platte River at Grant, Colo., 1910–
      North Fork of South Platte River at Cassells, Colo., 1908–1913.
      North Fork of South Platte River at South Platte, Colo., 1909–10; 1913–
        Geneva Creek above Jackwhacker Creek, near Grant, Colo., 1909–1911.
        Geneva Creek at Old Geneva smelter, near Grant, Colo., 1909–1911.
        Geneva Creek at Sullivan's ranch, near Grant, Colo., 1908–1911.
        Geneva Creek at Grant, Colo., 1911–
          Smelter Creek at Old Geneva smelter, near Grant, Colo., 1909–1911.
          Duck Lake Creek near Grant, Colo., 1909–1911.
          Scott Gomer Creek at Sullivan's ranch, near Grant, Colo. 1909–1913.
      Bear Creek near Morrison, Colo.,[1] 1888–1891; 1895–1902.
      Clear Creek at Idaho Springs, Colo., 1910–1912.
      Clear Creek at Forkscreek, Colo., 1899–1912.
      Clear Creek near Golden, Colo., 1887–88; 1908–9; 1911–
      St. Vrain Creek at Lyons, Colo.,[1] 1888–1892; 1895–1903; 1909–1913.
        Boulder Creek at Orodell, Colo.,[2] 1887–1890; 1907–1913.
        Boulder Creek near Boulder, Colo.,[1] 1888–1892; 1895–1901; 1907–1909.
          North Boulder Creek at Silver Lake, Colo., 1913–
          South Boulder Creek near Rollinsville, Colo., 1910–
          South Boulder Creek at Eldorado Springs (near Marshall), Colo. 188–1892; 1895–1901; 1909–1913.
            Community canal near Marshall, Colo., 1909.
      Big Thompson Creek near Drake, Colo., 1917–
      Big Thompson Creek near Arkins, Colo.,[1] 1888–1892; 1895–1911.
        Handy ditch near Arkins, Colo., 1899–1900; 1903.
      Cache la Poudre River near Elkhorn, Colo., 1909–1911.
      Cache la Poudre River near Fort Collins, Colo., 1909–1911.
      Cache la Poudre River at mouth of canyon near Fort Collins, Colo., 1884–1901; 1910–1913.
      Cache la Poudre River near Greeley, Colo., 1903.
      Crow Creek:
        Middle Fork of Crow Creek near Hecla, Wyo., 1902.

[1] Published only in Water-Supply Paper 74.
[2] Published as "North Boulder Creek above Boulder" in Thirteenth Ann. Rept., pt. 3.

Missouri River tributaries—Continued.
  Platte River tributaries—Continued.
    Middle Loup River (head of Loup River) near St. Paul, Nebr., 1895; 1897; 1899; 1903.
    Loup River at Columbus, Nebr., 1894–1915..
      North Loupe River near St. Paul, Nebr., 1895; 1897; 1899; 1903.
    Elkhorn River at Norfolk, Nebr., 1896–1903.
    Elkhorn River at Arlington, Nebr., 1899–1903; 1913–1915.
    Elkhorn River at Waterloo, Nebr., 1911–1913.
  Republican River, North Fork (head of Kansas River), near Haigler, Nebr., 1896.
  Republican River, North Fork, near Benkelman, Nebr., 1894–95; 1903–1906.
  Republican River at Culbertson, Nebr., 1913–1915.
  Republican River at Bostwick, Nebr., 1904–1915.
  Republican River near Superior, Nebr., 1896–1903.
  Republican River at Wakefield, Kans., 1917–
  Republican River at Junction, Kans., 1895–1905.
  Kansas River at Ogden, Kans., 1917–
  Kansas River near St. George, Kans., 1904.
  Kansas River at Topeka, Kans., 1904; 1917–
  Kansas River at Lecompton, Kans., 1899–1906.
  Kansas River near Lawrence, Kans., 1895–1899.
  Kansas River at Bonner Springs, Kans., 1917–
    South Fork of Republican River at Benkelman, Nebr., 1894–95; 1903–1906.
    Frenchman Creek near Wauneta, Nebr., 1895–96.
    Frenchman Creek near Palisade, Nebr., 1894–1896.
    Frenchman Creek at Culbertson, Nebr., 1913–1915.
    Smoky Hill River at Ellsworth, Kans., 1895–1905.
    Smoky Hill River at Solomon, Kans., 1904.
      Beaver (Ladder) Creek near Scott City, Kans., 1904–5.
      Saline River near Beverly, Kans., 1895–1897.
      Saline River near Salina, Kans., 1897–1903.
      Solomon River at Beloit, Kans., 1895–1897.
      Solomon River near Niles, Kans., 1897–1903.
    Big Blue River (head of Blue River) at Beatrice, Nebr., 1910–1915.
    Blue River at Manhattan, Kans., 1895–1905.
      Little Blue River at Blue Bluff, Nebr., 1912.
      Little Blue River near Fairbury, Nebr., 1908–1915.
  Osage (Marias des Cygnes) River at Ottawa, Kans., 1902–1905.
  Gasconade River at Arlington, Mo., 1903–1906.
    Piney Fork of Gasconade River near Houston, Mo., 1908–9.
    Piney Fork of Gasconade River near Hooker, Mo., 1903. (Also called Big Piney Creek.)
    Little Piney Creek near Arlington, Mo., 1903.

REPORTS ON WATER RESOURCES OF THE MISSOURI RIVER BASIN.

PUBLICATIONS OF UNITED STATES GEOLOGICAL SURVEY

WATER-SUPPLY PAPERS.

Water-supply papers are distributed free by the Geological Survey as long as its stock lasts. An asterisk (*) indicates that this stock has been exhausted. Many of the papers marked in this way may, however, be purchased (at price noted) from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C. Omission of the price indicates that the report is not obtainable from Government sources. Water supply papers are of octavo size.

*5. Irrigation practice on the Great Plains, by E. B. Cowgill. 1897. 39 pp., 12 pls. 10c.

Describes reservoirs for storm and pumped waters, ditching, methods of distributing water, cultivation and subirrigation, duty of water, and winter irrigation.

*9. Irrigation near Greeley, Colo., by David Boyd. 1897. 90 pp., 21 pls.

Treats of topography, rainfall, and water supply in the valley of Cache la Poudre River, a tributary of the South Platte; describes the canals and reservoir system, construction and operation of canals, and agricultural practice; discusses also the legislative and judicial control of the waters; speaks of the use of the underground water, effect of alkali waters on soil, pumping of underground waters, and artesian wells.

*12. Underground waters of a portion of southeastern Nebraska, by N. H. Darton. 1898. 56 pp., 21 pls.

Discusses physiography, geology, underground waters of moderate depth, and water horizons in Lancaster, Seward, northern Saline, York, Fillmore, Hamilton, Clay, Hall, Adams, Buffalo, Kearney, Phelps, northern Gosper, and eastern and central Dawson counties; reviews briefly the prospects for obtaining deeper-seated waters.

*23. Water-right problems of the Big Horn Mountains, by Elwood Mead. 1899. 62 pp., 7 pls. 10c.

Discusses water divisions, districts, appropriations, reservoirs, and administrative questions.

*29. Wells and windmills in Nebraska, by E. H. Barbour. 1899. 85 pp., 27 pls. 15c.

Describes home-made windmills; discusses briefly action of water underground, transmission and storage of windmill power, precipitation, surface waters for irrigation, supply for cities and towns, salt water, and blowing wells.

*34. Geology and water resources of a portion of southeastern South Dakota, by J. E. Todd. 1900. 34 pp., 10 pls. 10c.

Describes areas in Turner, Hutchinson, Bonhomme, Yankton, and Clay counties, including typical sections of the valleys of James and Vermillion rivers.

*44. Profiles of rivers in the United States, by Henry Gannett. 1901. 100 pp., 11 pls.

Gives elevations and distances along rivers of the United States, including Missouri, Jefferson, Bighole, Beaverhead, Madison, Gallatin, Osage, Kansas, Republican, Platte, Yellowstone, Milk, and James rivers; also brief descriptions of many of the streams. Arrangement geographic. Many river profiles are scattered through other reports on surface waters in various parts of the United States.

*57. Preliminary list of deep borings in the United States, Part I (Alabama-Montana), by N. H. Darton. 1902. 60 pp. 5c.

*61. Preliminary list of deep borings in the United States, Part II (Nebraska-Wyoming), by N. H. Darton. 1902. 67 pp. 5c.

A second, revised, edition was published in 1905 as Water-Supply Paper 149 (q. v.).

*70. Geology and water resources of the Patrick and Goshen Hole quadrangles, in eastern Wyoming and western Nebraska, by G. I. Adams. 1902. 50 pp., 11 pls. 15c.

Describes the geologic formation, surface features, water supply (surface and underground, irrigation, and agricultural products of a part of the Great Plains; discusses settlement and occupancy of public lands, and in an appendix gives the text of the "desert-lands" act, the Carey act, and an act for the construction of reservoirs on public lands for the watering of stock.

74. Water resources of the State of Colorado, by A. L. Fellows. 1902. 151 pp., 14 pls. 25c.

Discusses under South Platte, Arkansas, Rio Grande, San Juan, Grand, and Green River irrigation divisions, drainage, and irrigation, and gives records of stream flow.

90. Geology and water resources of part of the lower James River Valley, South Dakota, by J. E. Todd and C. M. Hall. 1904. 47 pp., 23 pls. 35c.

Describes topography, geologic formations, and surface and underground waters of Davison, Hanson, Sanborn, Beadle, and Miner counties, and portions of Kingsbury, Jerauld, Aurora, and McCook counties, S. Dak.

93. Proceedings of first conference of engineers of the Reclamation Service, with accompanying papers, compiled by F. H. Newell, chief engineer. 1904. 361 pp. 25. [Inquiries concerning this report should be addressed to the Reclamation Service.] Contains:

Irrigation in North Dakota by pumping, by F. A. Wilder. Discusses the use of lignite as a fuel for the operation of farm engines.

South Dakota investigations, by Raymond F. Walter. Mentions surveys of reservoir sites on creeks north of Rapid City and the water supply of the Belle Fourche project.

Work on North Platte River in Wyoming, by John E. Field.

Investigations in Wyoming, by Jeremiah Ahern. Describes the Lake De Smet and the Shoshone projects.

Reclamation and water storage in Nebraska, by O. V. P. Stout. Describes North Platte River and discusses its possible use for irrigation. Gives tables showing monthly discharge of the river from 1895 to 1902 and the volume of storage necessary to insure water to meet possible demands. Describes also Frenchman, Loup, and Niobrara rivers.

96. Destructive floods in the United States in 1903, by E. C. Murphy. 1904. 81 pp., 13 pls. 15c.

Gives notes on early floods in Mississippi Valley, and describes floods on Kansas River and its tributaries (Blue, Republican, Solomon, Saline, and Smoky Hill rivers); gives an account of the losses and suggests methods of flood prevention; contains also discharge tables and compares flood and ordinary data.

102. Contributions to the hydrology of eastern United States, 1903; M. L. Fuller, geologist in charge. 1904. 522 pp. 30c.

Contains brief reports on wells and springs of Minnesota and Missouri. The reports comprise tabulated well records giving information as to location, owner, depth, yield, head, etc., supplemented by notes as to elevation above sea, materials penetrated, temperature, use and quality; many miscellaneous analyses.

*103. A review of the laws forbidding pollution of inland waters in the United States, by E. B. Goodell. 1904. 120 pp. Superseded by 152.

Cites statutory restriction of water pollution.

*110. Contributions to the hydrology of eastern United States, 1904; M. L. Fuller, geologist in charge. 1905. 211 pp., 5 pls. 10c.

Contains a brief report on the "Spring system of the Decaturville dome, Camden County Mo.," by E. M. Shepard. Some of these springs are of immense size and present many points of interest.

*114. Underground waters of eastern United States; M. L. Fuller, geologist in charge. 1905. 285 pp., 18 pls. 25c.

Contains brief reports as follows:

Missouri, by E. M. Shepard.

Iowa, by W. H. Norton.

Each of these reports describes briefly the topography of the area, the relation of the geology to the water supplies, and gives list of pertinent publications; lists also principal mineral springs.

117. The lignite of North Dakota and its relation to irrigation, by F. A. Wilder. 1905. 59 pp., 8 pls. 10c.

Describes the thickness, extent, variations, and fuel value of the lignite and its use for pumping water, the area, soils, and lignite of the river flats, and the status of irrigation in the State.

*122. Relation of the law to underground waters, by D. W. Johnson. 1905. 55 pp. 5c.

Cites legislative acts relating to ground waters in Colorado, Nebraska, South Dakota, and Wyoming.

146. Proceedings of second conference of engineers of the Reclamation Service, with accompanying papers, compiled by F. H. Newell, chief engineer. 1905. 267 pp. 15c. [Inquiries concerning this report should be addressed to the Reclamation Service.]

Contains brief account of the organization of the hydrographic (water-resources) branch and the Reclamation Service, reports of conferences and committees, circulars of instruction, and many brief reports on subjects closely related to reclamation, and a bibliography of technical papers by members of the service.

A brief report on "Irrigation development in North Dakota," by H. A. Storrs. Discusses the feasibility of pumping water from the Missouri to irrigate bench lands along its banks.

147. Destructive floods in United States in 1904, by E. C. Murphy and others. 1905. 206 pp., 18 pls. 15c. Contains:

Belle Fourche River flood, South Dakota, from report of R. F. Walter. Describes floods on Belle Fourche River (tributary to the Missouri through Cheyenne River) and on Cache la Poudre River and Crow Creek (tributaries of the South Platte).

*149. Preliminary list of deep borings in United States, second edition, with additions, by N. H. Darton. 1905. 175 pp. 10c.

Gives, by States (and within the States by counties), location, depth, diameter, yield, height of water, and other available information, concerning wells 400 feet or more in depth; includes all wells listed in Water-Supply Papers 57 to 61; mentions also principal publications relating to deep borings.

*152. A review of the laws forbidding pollution of inland waters in the United States (second edition), by E. B. Goodell. 1905. 149 pp. 10c.

Cites statutory restrictions of water pollution in Colorado, Iowa, Kansas, Minnesota, Missouri Nebraska, North and South Dakota, and Wyoming.

*162. Destructive floods in the United States in 1905, with a discussion of flood discharge and frequency and an index to flood literature, by E. C. Murphy and others. 1906. 105 pp., 4 pls. 15c.

Gives accounts of floods in eastern Missouri and South Dakota, and estimates of floods discharge and frequency on Kansas, Loup, and Platte rivers; contains also index to literature on floods in American streams.

*184. The underflow of the South Platte Valley, by C. S. Slichter and H. C. Wolff. 1906. 42 pp. 5c.

Describes investigations of velocity, direction, quantity of underflow, and the underflow ditch at Ogalalla, Nebr., gives chemical analyses of the water, and discusses disadvantages of underflow canals; describes also the investigation at North Platte, Nebr., and gives suggestions for construction of small pumping plants.

*195. Underground waters of Missouri, their geology and utilization, by E. M. Shepard. 1907. 224 pp., 6 pls. 30c.

Describes the topography and geology of the State, the waters of the various formations, and discusses the water supplies by districts and counties; gives statistics of city water supplies, analyses of waters, and many well records.

*215. Geology and water resources of a portion of the Missouri River valley in northeastern Nebraska, by G. E. Condra. 1908. 59 pp., 11 pls. 40c.

Describes topography, rock formation, mineral resources, streams, springs, shallow and artesian wells, soils, crops, and timber, in Boyd, Knox, Cedar, Dixon, and Dakota counties, and part of Holt County.

*216. Geology and water resources of the Republican River valley and adjacent areas, Nebraska, by G. E. Condra. 1907. 71 pp., 13 pls. 15c.

Describes topographic, drainage, temperature, rainfall, winds, rock systems, surface and underground waters, water powers, soils, crops, and timbers of Dundy, Hitchcock, Redwillow, Furnas, Harlan, Franklin, Webster, Nuckolls, Thayer, and Jefferson counties.

221. Geology and water resources of the Great Falls region, Montana, by C. A. Fisher. 1909. 89 pp., 7 pls. 20c.

Describes the topographic features, geologic-formation, streams, lakes, swamps, springs, and artesian wells of a portion of the Great Plains in Cascade, Teton, Fergus, Chouteau, and Lewis and Clark counties; discusses the chemical character of the waters (analyses), water powers, irrigation, temperature, rainfall, and agriculture, and gives details of water supplies by districts.

*227. Geology and underground waters of South Dakota, by N. H. Darton. 1909. 156 pp., 15 pls. 40c.

Describes physical features, geologic formations, water horizons, and, by counties, deep wells and well prospects; gives notes on construction and management of artesian wells.

*230. Surface water supply of Nebraska, by J. C. Stevens. 1909. 251 pp., 6 pls. 35c.

Discusses relation of rainfall to run-off and evaporation and seepage near Kearney; describes the river basins, and gives results of observations at gaging stations.

236. The quality of surface waters in the United States, Part I, Analyses of waters east of one hundredth meridian, by R. B. Dole. 1909. 123 pp. 10c.

Describes collection of samples, methods of examinations, preparation of solutions, accuracy of estimates, and expression of analytical results; gives results of analyses of waters of Missouri, North Platte, and Platte rivers.

*258. Underground-water papers, 1910, by M. L. Fuller, F. G. Clapp, G. C. Matson, Samuel Sanford, and H. C. Wolff. 1911. 123 pp., 2 pls. 15c.

Contains brief report entitled "The utilization of the underflow near St. Francis, Kans.," by H. C. Wolff; discusses the water-bearing material, velocity, amount, rate of movement, and quality of the waters; arrangement and method of sinking the wells selection and installation of pumps, engines and cost of pumping, storage reservoirs, and loss by evaporation.

273. Quality of the water supplies of Kansas, by H. N. Parker, with a preliminary report on stream pollution by mine waters in southeastern Kansas, by E. H. S. Bailey. 1911. 375 pp., 1 pl. 30c.

Describes the topographic and geologic features of the State and the artesian basins; discusses the significance of mineral constituents and classification of waters; gives details concerning quality of underground water by counties and surface water by drainage basins.

274. Some stream waters of the western United States, with chapters on sediment carried by the Rio Grande and the industrial application of water analyses, by Herman Stabler. 1911. 188 pp. 15c.

Describes collection of samples, plan of analytical work, and methods of analysis; discusses soap-consuming power of waters, water softening, boiler waters, and water for irrigation; gives results of analyses of samples of water from streams in Missouri River basin.

293. Underground water resources of Iowa, by W. H. Norton, W. S. Hendrixson, H. E. Simpson, O. E. Meinzer, and others. 1912. 994 pp., 18 pls. 70c.

Describes the relief, drainage, temperature, and precipitation of the State and the geologic formations; discusses the geologic occurrence of underground waters, artesian phenomena and yield of artesian wells, the chemical composition of underground waters, municipal, domestic, and industrial water supplies, and mineral waters; gives details concerning topography, geology, underground waters, and city and village supplies by districts and counties.

345. Contributions to the hydrology of the United States, 1914; N. C. Grover, chief hydraulic engineer. 1915. 225 pp., 17 pls. 30c. Contains:

*(*g*) The water resources of Butte, Mont., by O. E. Meinzer (pp. 79-125, pls. 7-8.)

364. Water analyses from the laboratory of the United States Geological Survey, tabulated by F. W. Clarke, chief chemist. 1914. 40 pp.

Contains analyses from spring and well waters from Missouri, Wyoming, Yellowstone National Park, Montana, and Colorado, and of mine waters from Butte, Mont.

367. Profile surveys of Missouri River from Great Falls to Three Forks, Montana, prepared under the direction of R. B. Marshall, chief geographer. 1914. 8 pp., 1 pl. (13 sheets). 50c.

Gives a brief description of the general features of the Missouri River basin, a list of the gaging stations that have been maintained between Three Forks and Great Falls, and of the publications containing the results of stream-flow measurements.

*425. Contributions to the hydrology of the United States, 1917; N. C. Grover, chief hydraulic engineer. 1918. Contains:

*(b) Ground water for irrigation in Lodgepole Valley, Wyo.-Nebr., by O. E. Meinzer (pp. 37-69, pls. 4-6). Describes the physiography and geology of Lodgepole Valley and the adjacent region and the water in the alluvial gravel and in the Tertiary and Cretaceous formations; discusses irrigation with ground water; gives well data and analyses of 20 wells waters and 2 samples from Lodgepole Creek; contains maps showing the geology and the depths to the water table; also includes data on the cost of pumping for irrigation in western Nebraska, by H. C. Diesem, U. S. Department of Agriculture.

428. Artesian water in the vicinity of the Black Hills, S. Dak., by N. H. Darton. 1918. 64 pp., 13 pls.

Describes the geology and artesian-water conditions in areas covered in previous reports but in the light of additional data. Discusses the artesian prospects of the Dakota, Minnelusa, and Deadwood sandstones. Contains a map showing the geology and the depths to the water-bearing sandstones.

ANNUAL REPORTS.

Each of the papers contained in the annual reports was also issued in separate form.

Annual reports are distributed free by the Geological Survey as long as its stock lasts. An asterisk (*) indicates that this stock has been exhausted. Many of the papers so marked, however, may be purchased from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

*Tenth Annual Report of the United States Geological Survey, 1888-89; J. W. Powell, Director. 1890. 2 parts. *Pt. II. Irrigation, viii, 123 pp. 35c.

Makes a preliminary report on the organization and prosecution of the survey of the arid lands for purposes of irrigation; includes an account of the methods of topographic and hydraulic work, the segregation work on reservoir sites and irrigable lands, field and office methods, and brief descriptions of the topography of some of the river basins.

Eleventh Annual Report of the United States Geological Survey, 1889-90; J. W. Powell, Director. 1891. 2 parts. Pt. II. Irrigation, xiv, 395 pp., 30 plates and maps. $1.25. Contains:

*Hydrography, pp. 1-110. Discusses scope of work, methods of stream measurements, rainfall, and evaporation, and describes the more important streams.

*Engineering, pp. 111-200. Defines the scope of the work and gives an account of the surveys in the Sun River basin and in the Arkansas, Rio Grande, California, Lahontan, Utah, and Snake River divisions.

*The arid lands, pp. 201-289. Includes statement of the Director to the House Committee on Irrigation, extracts from the constitutions of States relating to irrigation, and a report on artesian irrigation on the Great Plains, including a discussion of the general considerations affecting artesian water supply, the economic limit to the utilization of artesian water for irrigation, irrigation by artesian wells in various countries, and the geologic conditions and statistics of artesian wells on the Great Plains.

*Topography, pp. 291-343. Comprises reports of the topographic surveys in California, Nevada, Colorado, Idaho, Montana, and New Mexico, and a report on reservoir sites.

*Irrigation literature, pp. 345-388. Gives a list of books and pamphlets on irrigation and allied subjects, mainly contained in the library of the United States Geological Survey.

*Twelfth Annual Report of the United States Geological Survey, 1890-91; J. W. Powell, Director. 1891. 2 parts. *Pt. II. Irrigation, xviii, 576 pp., 93 pls. $2.00. Contains:

*Report upon the location and survey of reservoir sites during the fiscal year ended June 30, 1891, by A. H. Thompson, pp. 1-212, pls. 54-57. Describes reservoir sites in Meagher, Lewis and Clark, Beaverhead, Madison, Chouteau, Cascade, and Fergus counties, Mont., and for each site gives the location, brief description of the drainage basin, height of dam, capacity of reservoir, and the area of segregated land.

*Hydrography of the arid regions, by F. H. Newell, pp. 213-361, pls. 58-106. Discusses the available water supply of the arid regions, the duty of water, flood waters, relation of rainfall to river flow; classifies the drainage basins; and describes the rivers of the Missouri, Arkansas, Rio Grande, Colorado, Sacramento, and San Joaquin basins, and the principal streams of the Great Basin in Nevada and Utah and the Snake River basin.

Thirteenth Annual Report of the United States Geological Survey, 1891–92; J. W. Powell, Director. 1892. (Pts. II and III, 1893.) 3 parts. *Pt. III. Irrigation, xi, 486 pp., 77 pls. $1.85. Contains:

*Water supply for irrigation, by F. H. Newell, pp. 1–99, pls. 108–110. Discusses areas irrigated and irrigable, fluctuations in rivers and lakes, cost and value of water supply, and describes the location and area, topography, land classification, extent of irrigation, precipitation, and water measurements on the Missouri and its tributaries.

*Engineering results of irrigation survey, by H. M. Wilson, pp. 351–427, pls. 147–182. Describes the reservoirs, canal lines, areas of lands reclaimable, and estimated revenue from irrigation works on the Sun River system, Montana.

Sixteenth Annual Report of the United States Geological Survey, 1894–95; Charles D. Walcott, Director. 1896. (Pts. II, III, and IV, 1895.) 4 parts. *Pt. II. Papers of an economic character, xix, 598 pp., 42 pls. $1.25. Contains:

The public lands and their water supply, by F. H. Newell, pp. 457–533, pls. 35–39. Describes the general character of the public lands, the lands disposed of (railroad, grant, and swamp lands, and private, miscellaneous entries), lands reserved (Indian, forest, and military reservations), the vacant lands, and the rate of disposal of vacant lands; discusses the streams, wells, and reservoirs as sources of water supply; gives details for each State.

*Water resources of a portion of the Great Plains, by Robert Hay, pp. 535–588, pls. 40–42. Describes an area comprising between 5,000 and 6,000 square miles and including parts of three counties of Kansas, five counties of Nebraska, and six of Colorado, drained to the Missouri through Platte and Kansas rivers; discusses the lakes, streams, and springs of the area, the underflow of the river bottoms, and the water-bearing strata under the higher lands; treats also of the sources of the water supply, rainfall, rate of percolation, and volume; valley, upland, and deep wells; waterless wells, artesian flow, and blowing wells; and the temperature of the well waters; describes briefly the topography and geology of the region and the utilization of the water supply.

Seventeenth Annual Report of the United States Geological Survey, 1895–96; Charles D. Walcott, Director. 1896. 3 parts in 4 vols. *Pt. II. Economic geology and hydrography, xxv, 864 pp., 113 pls. $2.35. Contains:

Preliminary report on artesian waters of a portion of the Dakotas, by N. H. Darton, pp. 603–694, pls. 69–107. Gives an outline of the geologic relations; describes the water horizons and the extent of the artesian water, and gives details concerning wells and prospects by counties; discusses the origin, amount, pressure, head, and composition of the artesian water, the use of artesian water for power, and gives details concerning artesian irrigation by counties; contains also remarks on the construction and management of artesian wells.

Eighteenth Annual Report of the United States Geological Survey, 1896–97; Charles D. Walcott, Director. 1897. (Pts. II and III, 1898.) 5 parts in 6 vols. *Pt. IV. Hydrography, x, 756 pp., 102 pls. $1.75. Contains:

*New development in well boring and irrigation in eastern South Dakota, 1896, by N. H. Darton, pp. 561–615, pls. 38–47. Discusses progress in well sinking and irrigation by artesian waters in 1896 in Aurora, Beadle, Bonhomme, Brule, Buffalo, Charles Mix, Davison, Douglas Hanson, Hutchinson, Jerauld, Sanborn, Spink, and Yankton counties, South Dakota, and in areas west of the Missouri River; treats also of the temperature and volume of flow of the deeper artesian waters and gives chemical analyses of waters from Missouri River and from artesian wells in the Sanborn basin.

*Reservoirs for irrigation, by J. D. Schuyler, pp. 617–740, pls. 48–102. Describes reservoir sites on Goose Creek, Tarryall Creek, and South Fork of South Platte River in Colorado; gives tables of reservoir capacity and areas.

Nineteenth Annual Report of the United States Geological Survey, 1897–98; Charles D. Walcott, Director. 1898. (Pts. II, III, IV, and V, 1899.) 6 parts in 7 vols. and separate case for maps with Pt. V. *Pt. IV, Hydrography, viii, 814 pp., 118 pls. $1.85. Contains:

*Preliminary report on the geology and water resources of Nebraska west of the one hundred and third meridian, by N. H. Darton, pp. 719–785, pls. 74–118. Describes topography and drainage of the area, the general geology of Nebraska, and the geology of the area covered by the report; the water horizons, and deep-seated waters; discusses springs, streams, irrigation, climate, and timber, and gives list of elevations.

——— *Pt. V, Forest reserves, pp. xvii–400, 110 pls. (16 maps in separate case, paper, 75c.; cloth, $1.00.) $1.25. Contains:

*Black Hills Forest Reserve, by H. S. Graves, pp. 67–164, pls. 14–36.
*Big Horn Forest Reserve, by F. E. Town, pp. 165–190, pls. 37–42.
Yellowstone Park Forest Reserve, southern part, from notes by T. S. Brandegee, pp. 213–216.
These reports contain many descriptions of the streams of the forest reserves.

Twentieth Annual Report of the United States Geological Survey, 1898–99; Charles D. Walcott, Director. 1899. (Pts. II, III, IV, V, and VII, 1900.) 7 parts in 8 vols. and separate case for maps with Pt. V. *Pt. V, Forest reserves, xix, 498 pp., 159 pl., 8 maps in separate case. $2.80. Contains:

*Pikes Peak, Plum Creek, and South Platte reserves, by J. G. Jack, pp. 39–115, pls. 8–47. Describes briefly the drainage of the forest reserves.

Twenty-first Annual Report of the United States Geological Survey, 1899–1900; Charles D. Walcott, Director. 1900. (Pts. III, IV, VI, VI continued, and VII, 1901.) 7 parts in 8 vols., and separate case for maps with Pt. V. *Pt. IV, Hydrography, 768 pp., 156 pls. $2.25. Contains:

*Preliminary description of the geology and water resources of the southern half of the Black Hills and adjoining regions in South Dakota and Wyoming, by N. H. Darton, pp. 489–599, pls. 58–112. Describes the topography and geology of an area comprisong about 5,500 square miles in southwestern corner of South Dakota, and the adjoining portion of Wyoming. Discusses the geologic formations and their contained waters, the deep borings at Edgemont and other places, the surface waters (Cheyenne and Fall River, Beaver, Lame Johnny, French, Battle Spring, Hat, Cascade, Stockade Beaver, and Beaver Creeks), and irrigation, the soils, mineral resources, climate, temperature, and timber.

*The High Plains and their utilization, by W. D. Johnson, pp. 601–741, pls. 113–146. Describes the area lying in an irregular belt about midway across the long eastward slope of the Great Plains and including parts of Wyoming, Colorado, Nebraska, Kansas, New Mexico, Oklahoma, and Texas; discusses the origin and structure of the High Plains, the precipitation, temperature, and other factors of climate, experiments with irrigation, and the use of mountain streams, local storm-water storage, and artesian waters. Concluded in the Twenty-second Annual Report, Pt. IV, pp. 631–669, pls. 51–65.

——— *Pt. V, Forest reserves, 711 pp., 143 pls., 39 maps in separate case. $3.85. Contains:

*Lewis and Clarke Forest Reserve, Mont., by H. B. Ayres, pp. 27–80, pls. 2–32. Briefly describes the valleys of the streams.

BULLETINS.

An asterisk (*) indicates that the Geological Survey's stock of the paper is exhausted. Many of the papers so marked may be purchased from the Superintendent of Documents, Washington, D. C.

*47. Analyses of waters of the Yellowstone National Park, with an account of the methods of analysis employed, by F. A. Gooch and J. E. Whitfield. 1888. 84 pp.

Describes methods used in analyzing natural waters and contains analyses of 43 geyser, spring, and surface waters in Yellowstone National Park.

*264. Record of deep-well drilling for 1904, by M. L. Fuller, E. F. Lines, and A. C. Veatch. 1905. 106 pp. 10c.

Discusses the importance of accurate well records to the driller, to owners of oil, gas, and water wells, and to the geologist; describes the general methods of work; gives tabulated records of wells in Kansas and Missouri, and detailed records of wells in Greeley County, Kansas, and Randolph County, Missouri. These wells were selected because they give definite stratigraphic information.

265. Geology of the Boulder district, Colo., by N. M. Fenneman. 1905. 101 pp., 5 pls. 15c.

Describes the geology of a rectangular area 16 miles north and south by 9 miles east and west, in the southwestern part of which is situated the city of Boulder. Discusses briefly (pp. 67–69) the flowing wells and water-bearing formations, including the Dakota sandstone. Contains a geologic map of the area.

*298. Record of deep-well drilling for 1905, by M. L. Fuller and Samuel Sanford. 1906. 299 pp. 25c.

Gives an account of progress in the collection of well records and samples; contains tabulated records of wells in Colorado, Iowa, Kansas, Minnesota, Missouri, Montana, Nebraska, North Dakota, South Dakota, and Wyoming, and detailed records of wells in Geary and Wyandotte counties, Kansas; Jackson County, Missouri; Teton County, Montana; and Beadle and Miner counties, South Dakota. The wells of which detailed sections are given were selected because they afford valuable stratigraphic information.

*364. Geology and mineral resources of the Laramie basin, Wyo. (a preliminary report, by N. H. Darton and C. E. Siebenthal. 1909. 81 pp., 8 pls. 20c.

Describes the geology and contains a geologic map. Includes a section on ground water (pp. 67–78), in which are given well data and 6 water analyses. A part of the area is covered by Geologic Folio 173, which also contains information on ground water.

*395. Radioactivity of the thremal waters of Yellowstone National Park, by Herman Schlundt and R. B. Moore. 1909. 35 pp., 4 pls. 10c.

Describes the apparatus and methods used and presents and discusses the results of the experiments.

*471. Contributions to economic geology, 1910, Part II, Mineral fuels; M. R. Campbell, geologist in charge. 1912. 663 pp., 62 pls. $1.05.

Issued also in separate chapters. The following paper contains information on ground water:

*(a) The Powder River oil field, Wyo., by C. H. Wegemann (pp. 56–75). Describes the geology and contains a geologic map of a quadrangular area which includes Tps. 40–42 N., R. 81 W., and portions of adjoining townships. Contains brief notes on water supplies, including water-bearing formations (pp. 59, 59).

*575. Geology of the Standing Rock and Cheyenne River Indian reservations, North and South Dakota, by W. R. Calvert, A. L. Beekly, V. H. Barnett, and M. A. Pishel. 1914. 49 pp., 8 pls. 15c.

Covers an area lying west of Missouri River, north of Cheyenne River, and south of Cannonball River, and extending westward to 102d meridian. Describes the geology and contains a geologic map of the area. Includes a brief discussion of the water in the Dakota and Fox hills sandstones and in other formations (pp. 24–25).

*621. Contributions to economic geology, 1915, Part II, Mineral fuels; M. R. Campbell and David White, geologists in charge. 1916. 375 pp., 25 pls. 60c.

Issued also in separate chapters. The following chapter contains information on ground water:

*(l) Oil and gas near Basin, Big Horn County, Wyo., by C. T. Lupton (pp. 157–190, Pl. XVII), describes the geology and contains a geologic map of parts of Tps. 50–52 N., Rs. 92 and 93 W. Includes a brief description of the water supplies and of the water-bearing sand with a table giving percentages of oil and gas wells that obtained water in each of these sand strata (pp. 164–166) It also includes well records that contain some data in regard to water (pp. 186–189).

627. The lignite field of northwestern South Dakota, by D. E. Winchester, C. J. Hares, E. R. Lloyd, and E. M. Parks. 1916. 169 pp., 11 pls. 25c.

Describes the geology and contains geologic maps of Harding and Perkins counties. Describes the drainage and water supply and contains a small amount of data on deep well not given in Water-Supply Paper 227.

*641. Contributions to economic geology, 1916, Part II, Mineral fuels; David White, G. H. Ashley, and M. R. Campbell, geologists in charge.

Issued also in separate chapters. The following chapter contains information on ground water:

*(i) Anticlines in central Wyoming, by C. J. Hares (pp. 233–280, Pl. XVIII). Covers nearly 5,000 square miles in Natrona and Fremont counties, west of Casper and southeast of Lander. Contains, on pages 235 and 236, a brief discussion of the water supply, including statements regarding various hot springs, springs of large size, sulphur springs, and other mineral springs; also a statement regarding water-bearing formations and artesian prospects. Includes a geologic map.

647. The Bull Mountain coal fields, Musselshell and Yellowstone counties, Mont.; by L. H. Woolsey, R. W. Richards, and C. T. Lupton. 1917. 218 pp., 36 pls.

Gives detailed data regarding water supplies, including ground water, for the following townships: Tps. 5–8 N., R. 24 E.; Tps. 5–8 N., R. 25 E.; Tps. 5–8 N., R. 26 E.; Tps. 5–9 N., R. 27 E.; Tps. 5–9 N., R. 28 E.; Tps. 5–9 N., R. 29 E.; Tps. 5–9 N., R. 30 E.; Tps. 5–9 N., R.. 31 E.; T. 8 N., R. 32 E.

656. Anticlines in the southern part of the Big Horn Basin, Wyo., a preliminary report on the occurrence of oil, by D. F. Hewett and C. T. Lupton. 1917. 192 pp., 32 pls. 35c.

Covers a large region in northwestern Wyoming, west of the Big Horn Mountains. Gives detailed data regarding surface waters, springs, wells, and ground-water prospects in the numerous anticlinal areas described in the report. See pages 15, 16, 56–188. Includes a geologic map and section.

PROFESSIONAL PAPERS.

Professional papers are distributed free by the Geological Survey as long as its stock lasts. An asterisk (*) indicates that this stock has been exhausted. Many of the papers marked with an asterisk may, however, be purchased from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C. Professional papers are of quarto size.

*17. Preliminary report on the geology and water resources of Nebraska west of the one hundred and third meridian, by N. H. Darton. 1903. 69 pp., 43 pls. 50c.

Describes topography and general geology of Nebraska, the streams, springs, and deep-seated waters, and irrigation; gives list of elevations.

*32. Preliminary report on the geology and underground water resources of the central Great Plains, by N. H. Darton. 1905. 433 pp., 72 pls. $1.80.

Describes topography, drainage, stratigraphy, historical geology, and the water horizons; discusses deep wells and prospects (by counties and towns) in South Dakota (see Water-Supply Paper 227), Nebraska, central and western Kansas, eastern Colorado, and eastern Wyoming; discusses also the occurrence of coal, petroleum, and natural gas, salt, gypsum, gold, iron ore, and other minerals.

*53. Geology and water resources of the Big Horn basin, Wyoming, by C. A. Fisher. 1906. 72 pp., 16 pls.

Describes the topography of the region, the stratigraphic, structural, and historical geology, and the underground waters, coal, oil, and gas, building stone, and other mineral resources; discusses briefly irrigation and mineral waters.

*65. Geology and water resources of the northern portion of the Black Hills and adjoining regions in South Dakota and Wyoming, by N. H. Darton. 1909. 105 pp., 24 pls. 40c.

Describes the topography of the region and the stratigraphic, structural, and historical geology of the sedimentary rocks; discusses their mineral resources, including underground water, coal, gypsum, etc.; contains also information concerning the surface waters.

MONOGRAPHS.

Monographs are of quarto size. They are not distributed free, but may be obtained from the Geological Survey or from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C., at the prices indicated. An asterisk (*) indicates that the Survey's stock of the paper is exhausted.

25. The glacial Lake Agassiz, by Warren Upham. 1896. 658 pp., 38 pls. $1.70.

Contains a chapter (pp. 523–582) on "Artesian and common wells of the Red River Valley," which discusses the sources of artesian water, the fresh waters in the drift sheets, the saline and alkaline waters in the Dakota sandstone, and the use of artesian water for irrigation; contains analyses of waters from wells, streams, and lakes in Red River Valley and the adjoining region; and gives notes on wells in Clay, Kittson, Marshall, Norman, Polk, Traverse, and Wilkin counties, in Minnesota; in Cass, Grand Forks, Pembina, Richland, Traill, and Walsh counties, in North Dakota; and in a part of the area covered by Lake Agassiz, in Manitoba. The monograph includes numerous maps relating to the Pleistocene geology of the region and a map (Pl. XXXVII) showing the distribution and depths of artesian wells in glacial drift and bedrock.

*27. Geology of the Denver Basin in Colorado, by S. F. Emmons, Whitman Cross, and G. H. Eldridge. 1896. 556 pp., 31 pls. $1.50.

Contains a discussion of the water in the Pleistocene deposits (pp. 272, 273) and a section on artesian wells (pp. 401–465). Discusses the history of artesian-water developments in Colorado, the water-bearing horizons, the artesian structure, the quantity of artesian water, and the yield and decrease in yield of flowing wells. Includes three analyses of well waters and maps showing the geology of the region and the original area of artesian flow.

GEOLOGIC FOLIOS.

Under the plan adopted for the preparation of a geologic map of the United States the entire area is divided into small quadrangles, bounded by certain meridians and parallels, and these quadrangles, which number several thousand, are separately surveyed and mapped.[1] The unit of survey is also the unit of publication, and the maps and description of each quadrangle are issued in the form of a folio. When all the folios are completed they will constitute the Geologic Atlas of the United States.

A folio is designated by the name of the principal town or of a prominent natural feature within the quadrangle. Each folio includes maps showing the topography, geology, underground structure, and mineral deposits of the area mapped and several pages of descriptive text. The text explains the maps and describes the topographic and geologic features of the country and its mineral products. The topographic map shows roads, railroads, waterways, and, by contour lines, the shapes of the hills and valleys and the height above sea level of all points in the quadrangle. The areal-geology map shows the distribution of the various rocks at the surface. The structural-geology map shows the relations of the rocks to one another underground. The economic-geology map indicates the location of mineral deposits that are commercially valuable. The artesian-water map shows the depth to underground-water horizons. Economic-geology and artesian-water maps are included in folios if the conditions in the areas mapped warrant their publication. The folios are of special interest to students of geography and geology and are valuable as guides in the development and utilization of mineral resources.

The folios numbered from 1 to 163, inclusive, are published in only one form (18 by 22 inches), called the library edition. Some of the folios that bear numbers higher than 163 are published also in an octavo edition (6 by 9 inches). Owing to a fire in the Geological Survey building May 18, 1913, the stock of geologic folios was more or less damaged by fire and water, but 80 or 90 per cent of the folios are usable. They will be sold at the uniform price of 5 cents each, with no reduction for wholesale orders. This rate applies to folios in stock from 1 to 184, inclusive (except reprints), also to the library edition of folio 186. The library edition of folios 185, 187, and higher numbers sells for 25 cents a copy, except that some folios which contain an unusually large amount of matter sell at higher prices. The octavo edition of folio 185 and higher numbers sells for 50 cents a copy, except folio 193, which sells for 75 cents a copy. A discount of 40 per cent is allowed on an order for folios or for folios togerher with topographic maps amounting to $5 or more at the retail rate.

All the folios contain descriptions of the drainage of the quadrangles. The folios in the following list contain also brief discussions of the underground waters in connection with the economic resources of the areas and more or less information concerning the utilization of the water resources.

*24. Three Forks, Montana.
*55. Fort Benton, Montana.
*56. Little Belt Mountains, Montana.
85. Oelrichs, South Dakota–Nebraska. 5c.
87. Camp Clark, Nebraska. 5c.
88. Scotts Bluff, Nebraska. 5c.
96. Olivet, South Dakota. 5c.
97. Parker, South Dakota. 5c.
99. Mitchell, South Dakota. 5c.
100. Alexandria, South Dakota. 5c.
*107. Newcastle, Wyoming–South Dakota. 5c.
108. Edgemont, South Dakota–Nebraska. 5c.
113. Huron, South Dakota. 5c.
114. De Smet, South Dakota. 5c.
117. Castleton-Fargo, North Dakota–Minnesota. 5c.

[1] Index maps showing areas in the Missouri River basin covered by typographic maps and by geologic folios will be mailed on receipt of request addressed to the Director, U. S. Geological Survey, Washington, D. C.

*127. Sundance, Wyoming-South Dakota.
*128. Aladdin, Wyoming-South Dakota-Montana. 5c.
*141. Bald Mountain-Dayton, Wyoming. 5c.
*142. Cloud Peak-Fort McKinney, Wyoming. 5c.
*150. Devils Tower, Wyoming.
156. Elk Point, South Dakota-Nebraska-Iowa. 5c.
165. Aberdeen-Redfield[1] (Northville, Aberdeen, Redfield, and Byron quadrangles), South Dakota. 5c.
168. Jamestown-Tower[1] (Jamestown, Eckleson, and Tower quadrangles), North Dakota. 5c.
181. Bismarck,[1] North Dakota. 5c.
196. Philipsburg, Montana. 25c.
206. Leavenworth, Smithville, Missouri-Kansas. 25c.

MISCELLANEOUS REPORTS.

Other Federal bureaus and State and other organizations have from time to time published reports relating to the water resources of the various sections of the country. Notable among those pertaining to the Missouri River basin are the reports of the Chief of Engineers, United States Army, of the State geologist of Kansas, the State Drainage Commission of Minnesota, the Commission on Conservation of the State of Montana, the State Board of Irrigation of Nebraska, the superintendent of the Department of Irrigation, Forestry, Fish, and Game of North Dakota, and the State Engineer of Wyoming. The following reports deserve special mention:

The Missouri River and its utmost source, by J. V. Brower. St. Paul, 1896.

Geological report of the exploration of the Yellowstone and Missouri rivers, by F. V. Hayden. Washington, 1869.

Preliminary examination of reservoir sites in Wyoming and Colorado: 55th Cong., 2d session, House Doc. 141.

Report of the Commission appointed by his excellency the governor of the State of Colorado to revise the laws of the State [of Colorado] regulating the appropriation, distribution, and use of water. Denver, 1890.

Some aspects of irrigation development in Colorado, by G. G. Anderson; Colorado Sci. Soc. Proc., vol. 9, 1909.

Special report on well waters in Kansas, by Erasmus Haworth; Kansas Univ. Geol. Survey Bull. 1.

Report of Board of Irrigation Survey and Experiment [Kansas] for 1895–96. Topeka, 1897.

Water supplies of Kansas, by C. A. Haskins and C. C. Young; Univ. of Kansas Bull. 5, vol. 16, 1915.

Report of the commission on conservation [State of Montana] on bills relating to public lands, water rights, and the protection and preservation of the forests. Helena, 1911.

Irrigation laws of the State of Wyoming; compiled in the office of the State engineer.

[1] Issued in two editions—library and octavo. Specify edition desired.

GEOLOGICAL SURVEY HYDROLOGIC REPORTS OF GENERAL INTEREST.

The following list comprises reports which are not readily classifiable by drainage basins and which cover a wide range of hydrologic investigations:

WATER-SUPPLY PAPERS.

*1. Pumping water for irrigation, by H. M. Wilson. 1896. 57 pp., 9 pls.

Describes pumps and motive powers, windmills, water wheels, and various kinds of engines; also storage reservoirs to retain pumped water until needed for irrigation.

*3. Sewage irrigation, by G. W. Rafter. 1897. 100 pp., 4 pls. (See Water-Supply Paper 22.) 10c.

Discusses methods of sewage disposal by intermittent filtration and by irrigation; describes utilization of sewage in Germany, England, and France, and sewage purification in the United States.

*8. Windmills for irrigation, by E. C. Murphy. 1897. 49 pp., 8 pls. 10c.

Gives results of experimental tests of windmills during the summer of 1896 in the vicinity of Garden, Kans.; describes instruments and methods and draws conclusions.

*14. New tests of certain pumps and water lifts used in irrigation, by O. P. Hood. 1898. 91 pp., 1 pl. 10c.

Discusses efficiency of pumps and water lifts of various types.

*20. Experiments with windmills, by T. O. Perry. 1899. 97 pp., 12 pls. 15c.

Includes tables and descriptions of wind wheels, makes comparisons of wheels of several types, and discusses results.

*22. Sewage irrigation, Part II, by G. W. Rafter. 1899. 100 pp., 7 pls. 15c.

Gives résumé of Water-Supply Paper No. 3; discusses pollution of certain streams, experiments on purification of factory wastes in Massachusetts, value of commercial fertilizers, and describes American sewage-disposal plants by States; contains bibliography of publications relating to sewage utilization and disposal.

*41. The windmill, its efficiency and economic use, Part I, by E. C. Murphy. 1901. 72 pp., 14 pls.

*42. The windmill, its efficiency and economic use, Part II, by E. C. Murphy. 1901. 75 pp., 2 pls. 10c.

Nos. 41 and 42 give details of results of experimental tests with windmills of various types.

*43. Conveyance of water in irrigation canals, flumes, and pipes, by Samuel Fortier. 1901. 86 pp., 15 pls. 15c.

*56. Methods of stream measurements. 1901. 51 pp., 12 pls. 15c.

Describes the methods used by the Survey in 1901-2. (See also Nos. 64, 94, and 95.)

*64. Accuracy of stream measurements, by E. C. Murphy. 1902. 99 pp., 4 pls. (See No. 95.) 10c.

Describes methods of measuring velocity of water and of measuring and computing stream flow, and compares results obtained with the different instruments and methods; describes also experiments and results at the Cornell University hydraulic laboratory. A second, enlarged, edition published as Water-Supply Paper 95.

*67. The motions of underground waters, by C. S. Slichter. 1902. 106 pp., 8 pls. 15c.

Discusses origin, depth, and amount of underground waters; permeability of rocks and porosity of soils; causes, rates, and laws of motions of underground water; surface and deep zones of flow, and recovery of waters by open wells and artesian and deep wells; treats of the shape and position of the water table; gives simple methods of measuring yield of flowing wells; describes artesian wells at Savannah, Ga.

72. Sewage pollution in the metropolitan area near New York City and its effect on inland water resources, by M. O. Leighton. 1902. 75 pp., 8 pls. 10c.

Defines "normal" and "polluted" waters and discusses the damage resulting from pollution.

*80. The relation of rainfall to run-off, by G. W. Rafter. 1903. 104 pp. 10c.

Treats of measurements of rainfall and laws of measurements of stream flow; gives formulas for rainfall, run-off, and evaporation; discusses effect of forests on rainfall and run-off.

87. Irrigation in India (second edition), by H. M. Wilson. 1903. 238 pp., 27 pls. 25c.

First edition was published in Part II of the Twelfth Annual Report.

93. Proceedings of first conference of engineers of the Reclamation Service, with accompanying papers, compiled by F. H. Newell, chief engineer. 1904. 361 pp. 25c.

Contains, in addition to an account of the organization of the hydrographic [water-resources] branch of the United States Geological Survey, and the report of the conference, the following papers of more or less general interest:

Limits of an irrigation project, by D. W. Ross.
Relation of Federal and State laws to irrigation, by Morris Bien.
Electrical transmission of power for pumping, by H. A. Storrs.
Correct design and stability of high masonry dams, by Geo. Y. Wisner.
Irrigation surveys and the use of the plane table, by J. B. Lippincott.
The use of alkaline waters for irrigation, by Thomas H. Means.

*94. Hydrographic manual of the United States Geological Survey, prepared by E. C. Murphy, J. C. Hoyt, and G. B. Hollister. 1904. 76 pp., 3 pls. 10c.

Gives instruction for field and office work relating to measurements of stream flow by current meters. (See also No. 95.)

*95. Accuracy of stream measurements (second, enlarged, edition), by E. C. Murphy. 1904. 169 pp., 6 pls.

Describes methods of measuring and computing stream flow and compares results derived from different instruments and methods. (See also No. 94.)

*103. A review of the laws forbidding pollution of inland waters in the United States, by E. B. Goodell. 1904. 120 pp. (See No. 152.)

Explains the legal principles under which antipollution statutes become operative, quotes court decisions to show authority for various deductions, and classifies according to scope the statutes enacted in the different States.

*110. Contributions to the hydrology of eastern United States, 1904; M. L. Fuller, geologist in charge. 1905. 211 pp., 5 pls. 10c.

Contains the following reports of general interest. The scope of each paper is indicated by its title.

Description of underflow meter used in measuring the velocity and direction of underground water, by Charles S. Slichter.
The California or "stovepipe" method of well construction, by Charles S. Slichter.
Approximate methods of measuring the yield of flowing wells, by Charles S. Slichter.
Corrections necessary in accurate determinations of flow from vertical well casings, from notes furnished by A. N. Talbot.
Experiment relating to problems of well contamination at Quitman, Ga., by S. W. McCallie.

113. The disposal of strawboard and oil-well wastes, by R. L. Sackett and Isaiah Bowman. 1905. 52 pp., 4 pls. 5c.

The first paper discusses the pollution of streams by sewage and by trade wastes, describes the manufacture of strawboard, and gives results of various experiments in disposing of the waste. The second paper describes briefly the topography, drainage, and geology of the region about Marion, Ind., and the contamination of rock wells and of streams by waste oil and brine.

*114. Underground waters of eastern United States; M. L. Fuller, geologist in charge. 1905. 285 pp., 18 pls. 25c.

Contains report on "Occurrence of underground waters," by M. L. Fuller, discussing sources, amount, and temperature of waters, permeability and storage capacity of rocks, water-bearing formations, recovery of water by springs, wells, and pumps, essential condition of artesian flows, and general conditions affecting underground waters in eastern United States.

119. Index to the hydrographic progress reports of the United States Geological Survey, 1888 to 1903, by J. C. Hoyt and B. D. Wood. 1905. 253 pp. 15c.

Scope indicated by title.

120. Bibliographic review and index of papers relating to underground waters published by the United States Geological Survey, 1879–1904, by M. L. Fuller. 1905. 128 pp. 10c.

Scope indicated by title.

*122. Relation of the law to underground waters, by D. W. Johnson. 1905. 55 pp. 5c.

Defines and classifies underground waters, gives common-law rules relating to their use, and cites State legislative acts affecting them.

140. Field measurements of the rate of movement of underground waters, by C. S. Slichter. 1905. 122 pp., 15 pls. 15c.

Discusses the capacity of sand to transmit water, describes measurements of underflow in Rio Hondo, San Gabriel, and Mohave River valleys, Calif., and on Long Island, N. Y., gives results of tests of wells and pumping plants, and describes stovepipe method of well construction.

143. Experiments on steel-concrete pipes on a working scale, by J. H. Quinton. 1905. 61 pp., 4 pls.

Scope indicated by title.

145. Contributions to the hydrology of eastern United States, 1905; M. L. Fuller, geologist in charge. 1905. 220 pp., 6 pls. 10c.

Contains brief reports of general interest as follows:

Drainage of ponds into drilled wells, by Robert E. Horton. Discusses efficiency, cost, and capacity of drainage wells, and gives statistics of such wells in southern Michigan.

Construction of so-called fountain and geyser springs, by Myron L. Fuller.

A convenient gage for determining low artesian heads, by Myron L. Fuller.

146. Proceedings of second conference of engineers of the Reclamation Service, with accompanying papers, compiled by F. H. Newell, chief engineer. 1905. 267 pp. 15c.

Contains brief account of the organization of the hydrographic [water-resources] branch and the Reclamation Service, reports of conferences and committees, circulars of instruction, and many brief reports on subjects closely related to reclamation, and a bibliography of technical papers by members of the service. Of the papers read at the conference those listed below (scope indicated by title) are of more or less general interest.

Proposed State code of water laws, by Morris Bien.
Power engineering applied to irrigation problems, by O. H. Ensign.
Estimates on tunneling in irrigation projects, by A. L. Fellows.
Collection of stream-gaging data, by N. C. Grover.
Diamond-drill methods, by G. A. Hammond.
Mean-velocity and area curves, by F. W. Hanna.
Importance of general hydrographic data concerning basins of streams gaged, by R. E. Horton.
Effect of aquatic vegetation on stream flow, by R. E. Horton.
Sanitary regulations governing construction camps, by M. O. Leighton.
Necessity of draining irrigated land, by Thos. H. Means.
Alkali soils, by Thos. H. Means.
Cost of stream-gaging work, by E. C. Murphy.
Equipment of a cable gaging station, by E. C. Murphy.
Silting of reservoirs, by W. M. Reed.
Farm-unit classification, by D. W. Ross.
Cost of power for pumping irrigating water, by H. A. Storrs.
Record of flow at current-meter gaging stations during the frozen season, by F. H. Tillinghast.

147. Destructive floods in United States in 1904, by E. C. Murphy and others. 1905. 206 pp., 18 pls. 15c.

Contains a brief account of "A method of computing cross-section area of waterways," including formulas for maximum discharge and area of cross section.

*150. Weir experiments, coefficients, and formulas, by R. E. Horton. 1906. 189 pp., 38 pls. (See Water-Supply Paper 200.) 15c.

Scope indicated by title.

151. Field assay of water, by M. O. Leighton. 1905. 77 pp., 4 pls. 10c.

Discusses methods, instruments, and reagents used in determining turbidity, color, iron chlorides, and hardness in connection with the studies of the quality of water in various parts of the United States.

*152. A review of the laws forbidding pollution of inland waters in the United States (second edition), by E. B. Goodell. 1905. 149 pp. 10c.

Scope indicated by title.

*160. Underground water papers, 1906; M. L. Fuller, geologist in charge. 1906. 104 pp., 1 pl.

Gives account of work in 1905; lists of publications relating to underground waters, and contains the following brief reports of general interest.

Significance of the term "artesian," by Myron L. Fuller.
Representation of wells and springs on maps, by Myron L. Fuller.
Total amount of free water in the earth's crust, by Myron L. Fuller.
Use of fluorescein in the study of underground waters, by R. B. Dole.
Problems of water contamination, by Isaiah Bowman.
Instances of improvement of water in wells, by Myron L. Fuller.

*162. Destructive floods in the United States in 1905, with a discussion of flood discharge and frequency and an index to flood literature, by E. C. Murphy and others. 1906. 105 pp., 4 pls. 15c.

*163. Bibliographic review and index of underground-water literature published in the United States in 1905, by M. L. Fuller, F. G. Clapp, and B. L. Johnson. 1906. 130 pp. 15c.

Scope indicated by title.

*179. Prevention of stream pollution by distillery refuse, based on investigations at Lynchburg, Ohio, by Herman Stabler. 1906. 34 pp., 1 pl. 10c.

Describes grain distillation, treatment of slop, sources, character, and effects of effluents on streams; discusses filtration, precipitation, fermentation, and evaporation methods of disposal of wastes without pollution.

*180. Turbine water-wheel tests and power tables, by R. E. Horton. 1906. 134 pp., 2 pls. 20c.

Scope indicated by title.

*185. Investigations on the purification of Boston sewage, * * * with a history of the sewage-disposal problem, by C.-E. E. Winslow and E. B. Phelps. 1906. 163 pp. 25c.

Discusses composition, disposal, purification, and treatment of sewages and recent tendencies in sewage-disposal practice in England, Germany, and the United States; describes character of crude sewage at Boston, removal of suspended matter, treatment in septic tanks, and purification by intermittent sand filtration and in beds of coarse material; gives bibliography.

*186. Stream pollution by acid-iron wastes, a report based on investigations made at Shelby, Ohio, by Herman Stabler. 1906. 36 pp., 1 pl.

Gives history of pollution by acid-iron wastes at Shelby, Ohio, and resulting litigation; discusses effect of acid-iron liquors on sewage-purification processes, recovery of copperas from acid-iron wastes, and other processes for removal of pickling liquor.

*187. Determination of stream flow during the frozen season, by H. K. Barrows and R. E. Horton. 1907. 93 pp., 1 pl. 15c.

Scope indicated by title.

*189. The prevention of stream pollution by strawboard waste, by E. B. Phelps. 1906. 29 pp., 2 pls. 5c.

Describes manufacture of strawboard, present and proposed methods of disposal of waste liquors, laboratory investigations of precipitation and sedimentation, and field studies of amounts and character of water used, raw material and finished product, and mechanical filtration.

*194. Pollution of Illinois and Mississippi rivers by Chicago sewage (a digest of the testimony taken in the case of the State of Missouri *v.* the State of Illinois and the Sanitary District of Chicago), by M. O. Leighton. 1907. 369 pp., 2 pls. 40c.

Scope indicated by amplification of title.

*200. Weir experiments, coefficients, and formulas, revision of paper No. 150, by R. E. Horton. 1907. 195 pp., 38 pls. 35c.

Scope indicated by title.

*226. The pollution of streams by sulphite-pulp waste, a study of possible remedies, by E. B. Phelps. 1909. 37 pp., 1 pl. 10c.

Describes manufacture of sulphite pulp, the waste liquors, and the experimental work leading to suggestions as to methods of preventing stream pollution.

*229. The disinfection of sewage and sewage filter effluents, with a chapter on the putrescibility and stability of sewage effluents, by E. B. Phelps. 1909. 91 pp., 1 pl. 15c.

Scope indicated by title.

*234. Papers on the conservation of water resources. 1909. 96 pp., 2 pls. 15c.

Contains the following papers, whose scope is indicated by their titles: Distribution of rainfall by Henry Gannett; Floods, by M. O. Leighton; Developed water powers, compiled under the direction of W. M. Steuart, with discussion by M. O. Leighton; Undeveloped water powers, by M. O. Leighton; Irrigation, by F. H. Newell; Underground waters, by W. C. Mendenhall; Denudation, by R. B. Dole and Herman Stabler; Control of catchment areas, by H. N. Parker.

*235. The purification of some textile and other factory wastes, by Herman Stabler and G. H. Pratt. 1909. 76 pp. 10c.

Discusses waste waters from wool scouring, bleaching and dyeing cotton yarn, bleaching cotton piece goods, and manufacture of oleomargarine, fertilizer, and glue.

236. The quality of surface waters in the United States, Part I, Analyses of waters east of the one-hundredth meridian, by R. B. Dole. 1909. 123 pp. 10c.

Describes collection of samples, methods of examination, preparation of solutions, accuracy of estimates, and expression of analytical results.

238. The public utility of water powers and their governmental regulation, by René Tavernier and M. O. Leighton. 1910. 161 pp. 15c.

Discusses hydraulic power and irrigation, French, Italian, and Swiss legislation relative to the development of water powers, and laws proposed in the French Parliament; reviews work of bureau of hydraulics and agricultural improvement of the French department of agriculture and gives résumé of Federal and State water-power legislation in the United States.

*255. Underground waters for farm use, by M. L. Fuller. 1910. 58 pp., 17 pls. 15c.

Discusses rocks as sources of water supply and the relative safety of supplies from different materials; springs, and their protection; open or dug deep wells, their location, yield, relative cost, protection, and safety; advantages and disadvantages of cisterns and combination wells and cisterns.

*257. Well-drilling methods, by Isaiah Bowman. 1911. 139 pp., 4 pls. 15c.

Discusses amount, distribution, and disposal of rainfall, water-bearing rocks, amount of underground water, artesian conditions, and oil and gas bearing formations; gives history of wel drilling in Asia, Europe, and the United States; describes in detail the various methods and the machinery used; discusses loss of tools and geologic difficulties; contamination of well waters and methods of prevention; tests of capacity and measurement of depth; and cost of sinking wells.

*258. Underground-water papers, 1910, by M. L. Fuller, F. G. Clapp, G. C. Matson, Samuel Sanford, and H. C. Wolff. 1911. 123 pp., 2 pls. 15c.

Contains the following papers (scope indicated by titles) of general interest:
Drainage by wells, by M. L. Fuller.
Freezing of wells and related phenomena, by M. L. Fuller.
Pollution of underground waters in limestone, by G. C. Matson.
Protection of shallow wells in sandy deposits, by M. L. Fuller.
Magnetic wells, by M. L. Fuller.

274. Some stream waters of the western United States, with chapters on sediment carried by the Rio Grande and the industrial application of water analyses, by Herman Stabler. 1911. 188 pp. 15c.

Describes collection of samples, plan of analytical work and methods of analyses; discusses soap-consuming power of waters, water softening, boiler waters, and water for irrigation; gives results of analyses of waters of the Rio Grande and of Pecos, Gallinas, and Hondo rivers.

*315. The purification of public water supplies, by G. A. Johnson. 1913. 84 pp., 8 pls. 10c.

Discusses ground, lake, and river waters as public supplies, development of waterworks systems in the United States, water consumption, and typhoid fever; describes methods of filtration and sterilization of water, and municipal water softening.

334. The Ohio Valley flood of March-April, 1913 (including comparisons with some earlier floods), by A. H. Horton and H. J. Jackson. 1913. 96 pp., 22 pls. 20c.

Although relating specifically to floods in the Ohio Valley, this report discusses also the causes of floods and the prevention of damage by floods.

337. The effects of ice on stream flow, by William Glenn Hoyt. 1913. 76 pp., 7 pls. 15c.

Discusses methods of measuring the winter flow of streams.

345. Contributions to the hydrology of the United States, 1914. N. C. Grover, chief hydraulic engineer. 1915. 225 pp., 17 pls. 30c.

*(e) A method of determining the daily discharge of rivers of variable slope, by M. R. Hall, W. E. Hall, and C. H. Pierce, pp. 53-65. Scope indicated by title.

364. Water and analyses from the laboratory of the United States Geological Survey, tabulated by F. W. Clarke, chief chemist. 1914. 40 pp. 5c.

Contains analyses of waters from rivers, lakes, wells, and springs in various parts of the United States, including analyses of the geyser water of Yellowstone National Park, Hot springs in Montana, brines from Death Valley, water from the Gulf of Mexico, and mine waters from Tennessee, Michigan, Missouri, and Oklahoma, Montana, Colorado and Utah, Nevada and Arizona, and California.

371. Equipment for current-meter gaging stations, by G. J. Lyon. 1915. 64 pp., 37 pls. 20c.

Describes methods of installing automatic and other gages and of constructing gage wells, shelters, and structures for making discharge measurements and artificial controls.

375. Contributions to the hydrology of the United States, 1915. N. C. Grover, chief hydraulic engineer. 1916. 181 pp., 9 pls. 15c.

Contains three papers presented at the conference of engineers of the water-resources branch in December, 1914, as follows:

*(c) Relation of stream gaging to the science of hydraulics, by C. H. Pierce and R. W. Davenport, pp. 77-84.

(e) A method of correcting river discharge for a changing stage, by B. E. Jones, pp. 117-130.

(f) Conditions requiring the use of automatic gages in obtaining records of stream flow, by C. H. Pierce, pp. 131-139.

*400. Contributions to the hydrology of the United States, 1916. N. C. Grover, chief hydraulic engineer.

(a) The people's interest in water-power resources, by G. O. Smith, pp. 1-8.

*(c) The measurement of silt-laden streams, by Raymond C. Pierce, pp. 39-51.

(d) Accuracy of stream-flow data, by N. C. Grover and J. C. Hoyt, pp. 53-59.

416. The divining rod, a history of water witching, with a bibliography, by Arthur J. Ellis. 1917. 59 pp. 10c.

A brief paper published "merely to furnish a reply to the numerous inquiries that are continually being received from all parts of the country" as to the efficacy of the divining rod for locating underground water.

*425. Contributions to the hydrology of the United States, 1917. N. C. Grover, chief hydraulic engineer. 1918. Contains:

*(c) Hydraulic conversion tables and convenient equivalents, pp. 71-94. 1917.

427. Bibliography and index of the publications of the United States Geological Survey relating to ground water, by O. E. Meinzer. 1918. 169 pp., 1 pl.

Includes publications prepared, in whole or in part, by the Geological Survey that treat any phase of the subject of ground water or any subject directly applicable to ground water. Illustrated by map showing reports that cover specific areas more or less thoroughly.

ANNUAL REPORTS.

*Fifth Annual Report of the United States Geological Survey, 1883–84, J. W. Powell, Director. 1885. xxxvi, 469 pp., 58 pls. $2.25. Contains:

The requisite and qualifying conditions of artesian wells, by T. C. Chamberlin, pp. 125-173, pl. 21. Scope indicated by title.

*Twelfth Annual Report ofthe United States Geological Survey, 1890–91, J. W. Powell, Director. 1891. 2 parts. *Part II, Irrigation, xviii, 576 pp., 93 pls. $2. Contains:

*Irrigation in India, by H. M. Wilson, pp. 363–561. pls. 107-146. (See Water-Supply Paper 87.)

Thirteenth Annual Report of the United States Geological Survey, 1891–92, J. W. Powell, Director. 1892. (Parts II and III, 1893.) 3 parts. *Part III, Irrigation, xi, 486 pp., 77 pls. $1.85. Contains:

*American irrigation engineering, by H. M. Wilson, pp. 101-349, pls. 111-146. Discusses the economical aspects of irrigation, alkaline drainage, silt, and sedimentation; gives brief history of legislation; describes perennial canals in Idaho-California, Wyoming, and Arizona; discusses water storage at reservoirs of the California and other projects, subsurface sources of supply, pumping and subirrigation.

Fourteenth Annual Report of the United States Geological Survey, 1892–93, J. W. Powell, Director. 1893. (Part II, 1894.) 2 parts. *Part II, Accompanying papers, xx, 597 pp., 73 pls. $2.10. Contains:

*Natural mineral waters of the United States, by A. C. Peale, pp. 49–88, pls. 3 and 4. Discusses the origin and flow of mineral springs, the source of mineralization, thermal springs, the chemical composition and analysis of spring waters, geographic distribution, and the utilization of mineral waters; gives a list of American mineral spring resorts; contains also some analyses.

Nineteenth Annual Report of the United States Geological Survey, 1897–98, Charles D. Walcott, Director. 1898. (Parts II, III, and V, 1899.) 6 parts in 7 vols. and separate case for maps with Part V. *Part II, Papers chiefly of a theoretic nature, v. 958 pp., 172 pls. $2.65. Contains:

*Principles and conditions of the movements of ground water, by F. H. King, pp. 59-294, pls. 6-16. Discusses the amount of water stored in sandstone, in soil, and in other rocks, the depth to which ground water penetrates; gravitational, thermal, and capillary movements of ground waters, and the configuration of the ground-water surface; gives the results of experimental investigations on the flow of air and water through a rigid, porous medium and through sands, sandstones, and silts; discusses results obtained by other investigators, and summarizes results of observations; discusses also rate of flow of water through sand and rock, the growth of rivers, rate of filtration through soil, interference of wells, etc.

*Theoretical investigation of the motion of ground waters, by C. S. Slichter, pp. 295-384, pl. 17. Scope indicated by title.

Twentieth Annual Report of the United States Geological Survey, 1898–99, Charles D. Walcott, Director. 1899. (Parts II, III, IV, V, and VII, 1900.) 7 parts in 8 vols. and separate case for maps with Part V. *Part IV, Hydrography, vii, 660 pp., 75 pls. $1.40. Contains:

*Hydrography of Nicaragua, by A. P. Davis, pp. 563-637, pls. 64-75. Describes the topographic features of the boundary, the Lake Basin, and Rio San Juan; gives a brief résumé of the boundary dispute; discusses rainfall, temperature, and relative humidity, evaporation, resources and productions, the ship-railway and canal projects; gives the history of the investigations by the Canal Commission, and results of measurements on the Rio Grande, on streams tributary to Lake Nicaragua, and on Rio San Jaun and its tributaries.

Twenty-second Annual Report of the United States Geological Survey, 1900–1901; Charles D. Walcott, Director. 1901. (Parts III and IV, 1902.) 4 parts. Part IV, Hydrography, 690 pp., 65 pls. $2.20. Contains:

*Hydrography of the American Isthmus, by A. P. Davis, pp. 507–630, pls. 37–50. Describes the physiography, temperature, rainfall, and winds of Central America; discussed the hydrography of the Nicaragua canal route and the Panama canal route; gives estimated monthly discharge of many of the streams, and rainfall and evaporation tables for various points.

PROFESSIONAL PAPERS.

*72. Denudation and erosion in the southern Appalachian region and the Monongahela basin, by L. C. Glenn. 1911. 137 pp., 21 pls. 35c.

Describes the relation of agriculture, lumbering, mining, and power development to erosion and denudation, and the nature, effects, and remedies of erosion; gives details of conditions in Holston, Nolichucky, French Broad, Little Tennessee, and Hiwassee river basins, along Tennessee River proper, and in the basins of the Coosa-Alabama system, Chattahoochee, Savannah, Saluda, Broad, Catawba, Yadkin, New, and Monongahela rivers.

*86. The transportation of débris by running water, by G. K. Gilbert, based on experiments made with the assistance of E. C. Murphy. 1914. 263 pp., 3 pls. 70c.

The results of an investigation which was carried on in a specially equipped laboratory at Berkeley, Calif., and was undertaken for the purpose of learning "the laws which control the movement of bed load, and specially to determine how the quantity of load is related to the stream's slope and discharge and to the degree of comminution of the débris."

A highly technical report.

105. Hydraulic mining débris in the Sierra Nevada, by G. K. Gilbert. 154 pp., 34 pls. 1917.

Presents the results of an investigation undertaken by the United States Geological Survey in response to a memorial from the California Miners' Association asking that a particular study be made of portions of the Sacramento and San Joaquin valleys affected by detritus from torrential streams. The report deals largely with geologic and physiographic aspects of the subject, traces the physical effects, past and future, of the hydraulic mining of earlier decades, the similar effects which certain other industries induce through stimulation of the erosion of the soil, and the influence of the restriction of the area of inundation by the construction of levees. Suggests cooperation by several interests for the control of the streams now carrying heavy loads of débris.

BULLETINS.

*32. Lists and analyses of the mineral springs of the United States (a preliminary study), by A. C. Peale. 1886. 235 pp.

Defines mineral waters, lists the springs by States, and gives tables of analyses so far as available.

*319. Summary of the controlling factors of artesian flows, by Myron L. Fuller. 1908. 44 pp., 7 pls. 10c.

Describes underground reservoirs, the sources of underground waters, the confining agents, the primary and modifying factors of artesian circulation, the essential and modifying factors of artesian flow, and typical artesian systems.

479. The geochemical interpretation of water analyses, by Chase Palmer. 1911. 31 pp. 5c.

Discusses the expression of chemical analyses, the chemical character of water and the properties of natural water; gives a classification of water based on property values and reacting values, and discusses the character of the waters of certain rivers as interpreted directly from the results of analyses; discusses also the relation of water properties to geologic formations, silica in river water, and the character of the water of the Mississippi and the Great Lakes and St. Lawrence River as indicated by chemical analyses.

INDEX BY AREAS AND SUBJECTS.

[A=Annual Report; M=Monograph; B=Bulletin; P=Professional Paper; W=Water-Supply Paper; G F=Geologic folio.]

[1] Many of the reports contain brief subject bibliographies. See abstracts.
[2] Many analyses of river, spring, and well waters are scattered through publications as noted in abstracts.

GAZETTEER OF STREAMS OF TEXAS.

Prepared under the direction of GLENN A. GRAY.

INTRODUCTION.

The following pages contain a gazetteer of streams, lakes, and ponds as shown by the topographic maps of Texas which were prepared by the United States Geological Survey and, in areas not covered by the topographic maps, by State of Texas county maps and the post-route map of Texas. For many streams a contour map of Texas, prepared in 1899 by Robert T. Hill, was consulted, as well as maps compiled by private surveys, engineering corporations, the State Board of Water Engineers, and the International Boundary Commission. An effort has been made to eliminate errors where practicable by personal reconnaissance.

All the descriptions are based on the best available maps, and their accuracy therefore depends on that of the maps. Descriptions of streams in the central part of the State, adjacent to the Rio Grande above Brewster County, and in parts of Brewster, Terrell, Bowie, Cass, Burleson, Brazos, Grimes, Washington, Harris, Bexar, Wichita, Wilbarger, Montague, Coke, and Grayson counties were compiled by means of topographic maps and are of a good degree of accuracy. It should be understood, however, that all statements of elevation, length, and fall are roughly approximate.

The Geological Survey topographic maps used are cited in the descriptions of the streams and are listed below. An index circular showing the area covered by each map may be obtained by applying to the Director, United States Geological Survey, Washington, D. C.

GAZETTEER.

Acero or Tranquitas Creek.—Jim Wells and Kleberg counties; rises in the eastern part of Jim Wells County; flows southeastward 22 miles into San Fernando Creek, thence to Gulf of Mexico through Baffins Bay.

Adams Branch.—Brown County; a stream 8 miles long flowing through the town of Brownwood in the southeastern part of the county; empties into Pecan Bayou and thus to the Colorado. Coleman and Brownwood topographic maps.

Adams Bayou.—Orange County; rises in the north central part of the county; flows southeasterly 11 miles into Sabine River (tributary to Sabine Lake and thus to Gulf of Mexico) about a mile south of Orange.

Adobe Creek.—Hutchinson County; an intermittent stream rising 16 miles northeast of Plemons and flowing southeasterly 8 miles to its junction with Canadian River (tributary to Arkansas River and thus to the Mississippi) 12 miles northeast of Plemons in eastern part of county.

Adams Creek.—Wilbarger County; rises in northeastern part 7 miles northwest of Electra; flows northeasterly into Red River and thus to the Mississippi; intermittent. Electra topographic map.

Agua Caballo or Horse Creek.—Oldham County; an intermittent stream rising in extreme northwestern corner of county and flowing southeasterly 13 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 15 miles north of Adrian in northwestern part of county.

Agua Dulce Creek.—Rises in the northwestern part of Jim Wells County; flows southwestward 12 miles into Santa Petronilla Creek (thence through Baffins Bay to Gulf of Mexico) 5 miles north of Driscoll.

Agua de Fuera Creek.—Kinney County; rises 8 miles northeast of Brackett; flows southeasterly 25 miles to Kinney-Maverick county line, where it enters Elm Creek (tributary to Nueces River) intermittent. Brackett topographic map.

Agua Negro Creek.—Atascosa County; rises in northern part of county; flows southerly 5 miles into Palo Alto Creek (tributary through Atascosa and Frio rivers to the Nueces).

Agua Piedra.—Oldham County; rises 5 miles northeast of Adrian; flows northwesterly 13 miles into Trujillo Creek (tributary to Canadian River, and thus through the Arkansas to the Mississippi) 13 miles north of Adrian in western part of county.

Alabama Creek.—Trinity County; rises in eastern part of county; flows easterly 11 miles into Neches River near intersection of Trinity and Polk county line east of Nathan.

Alabama, Village, or Big Sandy Creek.—Polk and Hardin countries; rises about 3 miles southeast of Moscow in Polk County; flows southeasterly 63 miles into Neches River about 2 miles east of Fletcher in Hardin County.

Alamo Creek.—Motley County; a stream 8 miles long rising in the northwestern part of county and flowing northeastward into Quitaque Creek (tributary to Pease River and thus through Red River to the Mississippi).

Alamito Creek.—Webb County; [illegible] northward to its junction with Salado Creek [illegible] Nueces River in the northeastern part of county.

Alamito Creek.—Presidio and Jeff Davis counties; rises 22 miles north of Marfa near Jeff Davis-Presidio county line at an approximate altitude of 5,250 feet above sea level; [illegible] Marfa then [illegible] miles via Alamito into Rio Grande 5 miles southeast of Presidio. Intermittent. Marfa, Alpine, and Shafter topographic maps.

Alamositas Creek.—Oldham County; an intermittent stream rising 10 miles northwest of Adrian and flowing northward 18 miles to its junction with Canadian River (tributary to Arkansas River and thus to the Mississippi) 15 miles west of Cheyenne in central part of county.

Alarm Creek.—Erath County; rises 7 miles southwest of Stephenville; flows southeasterly 13 miles into Bosque River (tributary to Brazos River) 4 miles northeast of Alexander in southern part of county. Stephenville topographic map.

Alexander Creek.—Hamilton County; a partially intermittent stream in central part of county; flows northeasterly 18 miles into Leon River (tributary through Little River to the Brazos) 7 miles northeast of Hamilton. Hamilton topographic map.

Alkali Creek.—Fisher County; a small stream flowing eastward 12 miles into Cottonwood Creek (which discharges into Brazos River through Clear Fork of the Brazos) 2 miles north of Roby in western part of county. Roby topographic map.

Allen Creek.—Fannin County; rises in southern part of county; flows into North Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi).

Allen Creek.—Lee County; a stream flowing southeasterly 10 miles into Second Yegua Creek (tributary to Yegua Creek and thus to the Brazos) in northern part of county. Bastrop topographic map.

Allen's or Eightmile Creek.—Austin County; rises near Sealy in southern part of county; flows southeasterly 15 miles into Brazos River near Wallis.

Allen's Branch.—Tarrant County; a short stream west of Fort Worth; joins Serugan Branch (tributary to West Fork of Trinity River and thus to the Trinity) about 5 miles west of Fort Worth. Weatherford and Fort Worth topographic maps.

Alleys Creek.—Lee County; rises near Hicks near Milam-Lee county line; flows southeasterly 6 miles into First Yegua Creek (tributary through Yegua Creek to Brazos River).

Alley Creek.—Cass and Marion Counties; rises in southwestern part of Cass County; flows southeasterly 13 miles into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) in southwestern part of Marion County.

Alligator Bayou.—Jefferson County; rises 3 miles northwest of Port Arthur in the eastern part of the county; flows southerly 7 miles into Taylor's Bayou (tributary through Sabine Lake to Gulf of Mexico) 2 miles southwest of Port Arthur; tidal; channel not defined; drains large areas of marshy and higher lands north of Port Arthur.

Alligator Creek.—Falls and Robertson counties; rises north of Bremond; flows southwesterly along county line 7 miles and empties into Little Brazos River (tributary to the Brazos).

Alligator Creek.—Williamson and Milam counties; a small stream joining San Gabriel River (tributary to Little River and thus to the Brazos) 5 miles east of San Gabriel in western part of Milam County. Taylor topographic map.

ALLIGATOR CREEK.—Leon and Freestone counties; rises about 3 miles northwest of Jewett in Leon County; flows northeasterly 7 miles into Buffalo Creek (tributary through Upper Keechi Creek to Trinity River) near county line in southern part of Freestone County.

ALPINE CREEK.—Brewster County; rises about 6 miles east of Paisano; flows 10 miles northeasterly through the town of Alpine to a point 3 miles north of Alpine, where it joins Paisano Creek (tributary to Pecos River and thus to Rio Grande). Alpine topographic map.

ALUM CREEK.—Bastrop County; rises 3 miles south of McDade in the northeastern part of county; flows southerly 17 miles into Colorado River, 4 miles northwest of Smithville. Bastrop topographic map.

ALUM CREEK.—Bastrop County; a small intermittent stream in southwestern part of county joining Walnut Creek (tributary to Colorado River) 1½ miles east of Otis; length, 7 miles. Austin and Bastrop topographic maps.

AMARILLO CREEK.—Potter County; rises near Soncy near to south line of county; flows northerly 20 miles through Probst into Canadian River, thence to Arkansas River and thus to the Mississippi.

AMARGOSO CREEK.—Jim Wells County; small stream in northwestern part of county, flowing southeasterly 10 miles into Chiltipin Creek (tributary through Pinias and Santa Petronilla creeks to Baffins Bay and thus to the Gulf of Mexico).

ANACUAS CREEK.—Duval and Jim Wells counties; rises in the central part of Duval County; flows southeastward 15 miles through Duval County, then 9 miles through Jim Wells County into Santa Gertrudis Creek (tributary to Baffins Bay and thus to Gulf of Mexico) near eastern line of Jim Wells County.

ANADARKO OR BARNHART CREEK.—Rusk County rises about 4 miles southeast of Henderson; flows southwesterly 11 miles into Big Shawnee Creek (tributary to Angelina River and thus to the Neches).

ANAQUITAS CREEK.—Duval and Jim Wells counties; small stream flowing into San Diego Creek (tributary through Chiltipin and Pinias to Santa Petronilla Creek and thus through Baffins Bay to Gulf of Mexico) in northeastern part of Duval County and northwestern part of Jim Wells County.

ANDERSON CREEK.—Angelina County; flows northeasterly about 6 miles into Angelina River (tributary to the Neches) at Marion in northeastern part of county.

ANDERSON CREEK.—Zavalla and Dimmitt counties; a small intermittent stream rising in the southern part of Zavalla County and flowing southward into Dimmitt County to its junction with Nueces River.

ANDERSON CREEK.—Red River and Bowie counties; rises in the eastern part of Red River County about 3½ miles southwest of Avery; flows southeasterly 33 miles into Sulphur River (tributary to Red River which discharges into the Mississippi) about 3 miles southwest of Corley in southwestern part of Bowie County. New Boston topographic map.

ANDYS OR JAKES CREEK.—Franklin and Titus counties; rises in southern part of Franklin County; flows southeasterly 11 miles into Big Cypress Bayou (tributary to Caddo Lake which discharges into the Mississippi through Red River) in southwestern part of Titus County.

ANGELINA RIVER.—Rusk, Smith, Cherokee, Nacogdoches, Angelina, San Augustine, and Jasper counties; rises in southwestern part of Rusk County; flows southeasterly 119 miles into Neches River about 12 miles west of Jasper in the northwestern part of Jasper County.

ANTELOPE CREEK.—Hutchinson and Carson counties; rises in western part of Carson County, northwest of Panhandle; flows northerly 22 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) in southwestern part of Hutchinson County.

ANTELOPE CREEK.—Shackleford County; rises 1 mile south of Antelope Hills in northern part of county; flows northwestward 7 miles into Clear Fork of Brazos River (tributary to the Brazos). Albany topographic map.

ANTELOPE CREEK.—Lampasas County; a small stream flowing 9 miles to its junction with Colorado River 2 miles southeast of Red Bluff in southwestern part of county. Lampasas and San Saba topographic maps.

ANTELOPE CREEK.—San Saba County; rises in the northwestern part of the county; flows 7 miles into Colorado River. Brady and San Saba topographic maps.

ANTELOPE CREEK.—Briscoe and Hall counties; rises in the eastern part of Briscoe County; flows northeasterly 7 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) in northwestern part of Hall County about one-half mile east of the west boundary of county.

ANTELOPE CREEK.—Baylor and Throckmorton counties; a stream 4 miles long flowing northwesterly to its junction with Millers Creek (tributary to Brazos River) in southern part of Baylor County.

ANTELOPE CREEK.—Nolan County; rises west of Blackwell in southern part of county; flows into Oak Creek (tributary to Colorado River); length, 11 miles. Sweetwater topographic map.

ANTELOPE CREEK.—Wichita County; rises 7 miles southwest of Iowa Park; flows northeasterly, northwesterly, and easterly 5 miles into Wichita River (tributary to Red River and thus to the Mississippi); small; intermittent. Iowa Park topographic map.

APACHE CANYON.—El Paso and Culberson counties; rises in eastern part of El Paso County; flows easterly and sinks in sands in western part of Culberson County 30 miles north of Van Horn; intermittent. Sierra Blanca and Van Horn topographic maps.

AQUILLA CREEK.—McLennan and Hill counties; rises 2 miles northwest of Covington in northern part of Hill County; flows southerly 45 miles into Brazos River 8 miles northwest of Waco in the northern part of McLennan County. Cleburne and Waco topographic maps.

ARANSAS RIVER.—Bee, Refugio, and San Patricio counties; rises in the central part of Bee County; flows southeastward 27 miles through Bee County, then 20 miles along the boundary of Refugio and San Patricio counties into the head of Copano Bay an arm of the Gulf of Mexico.

ARENOSA CREEK.—Victoria and Jackson counties; rises on the northern boundary of Victoria County; flows southeastward 28 miles forming the boundary of Jackson and Victoria counties into Lavaca Bay (which discharges into Gulf of Mexico through Matagorda Bay).

ARENOSA CREEK.—San Augustine County; rises in south central part of county; flows southeasterly 8 miles into Ayish Bayou (tributary to Angelina River and thus to the Neches).

ARENOSA CREEK.—Kinney County; small flood water stream rising in southern part of county and flowing southeasterly into Elm Creek (tributary to Nueces River); length, 19 miles. Brackett topographic map.

ARENOSA CREEK.—Shelby and San Augustine counties; rises in the southwestern part of Shelby County; flows southwesterly 12 miles into Attoyac Bayou (tributary to Angelina River and thus to the Neches) in the northwestern part of San Augustine County.

Armstrong Creek.—Comanche and Erath counties; formed 4½ miles west of Lingleville in the western part of Erath County by the union of the East and West Forks of Armstrong Creek; flows southward 20 miles into Leon River (tributary to Little River and thus to the Brazos) 9 miles west of Dublin in northeastern part of Comanche County. Stephenville topographic map.

Armstrong Creek, West Fork.—Erath County; rises near Smith Gap; flows southward 6 miles to its junction with East Fork of Armstrong Creek to form Armstrong Creek (tributary through Leon and Little rivers to the Brazos) in the western part of county, 4½ miles west of Lingleville. Stephenville topographic map.

Armstrong Creek, East Fork.—Erath County; rises northwest of Lingleville in western part of county; flows southwestward 6 miles to its junction with West Fork of Armstrong Creek forming Armstrong Creek (tributary through Leon and Little rivers to the Brazos) 4½ miles west of Lingleville in western part of county. Stephenville topographic map.

Armstong Creek.—Cass County; a small intermittent stream flowing into Shoal Creek (tributary to Sulphur River, which discharges into Mississippi River through the Red) about 3 miles northwest of Anti School in northern part of county. Linden topographic map.

Arroyo Amaladeros.—Nacogdoches County; flows southeasterly 9 miles into Attoyac Bayou (tributary to Angelina River and thus to the Neches) in eastern part of county.

Arroyo Colorado.—Hidalgo and Cameron counties; rises in southeastern part of Hidalgo County; flows eastward and northeastward 4 miles through Hidalgo County, then 35 miles through the central part of Cameron County into the Laguna Madre, an arm of the Gulf of Mexico; length, 39 miles. Intermittent. Tidal about 24 miles from its mouth. Mission and San Juan topographic maps.

Arroyo de los Angeles.—Webb, Duval, and Jim Hogg counties; small stream rising in the southeastern part of Webb County and flowing southeastward across corner of Duval County 16 miles to its junction with Noriacitas Creek (tributary to Palo Blanco Creek, thence through Laguna Madre and Baffins Bay to Gulf of Mexico) in northern part of Jim Hogg County.

Arroyo Dulce.—Austin County; a stream 3 miles long flowing into Brazos River at San Felipe.

Arroyo del Quenada.—Starr County; rises northeast of Salinero in the western part of the county; flows southerly 5 miles into Casas Blancas Creek (tributary to Rio Grande).

Arroyo Lagarto.—Live Oak, Duval, and Jim Wells counties; rises in the southwestern corner of Live Oak County; flows southeasterly 4 miles through the corner of Live Oak County, 4 miles through Duval County, then eastward and northeastward 9 miles through Jim Wells County, thence 13 miles through the southeastern part of Live Oak County into Nueces River near Lagarto; length, 30 miles.

Arroyo Negro.—Zavalla and Dimmit counties; rises in southern part of Zavalla County about 2 miles west of Loma Vista; flows southeasterly 10 miles through Zavalla County, then 15 miles through Dimmit County into Nueces River about 2 miles south of Valley Wells.

Arroyo Nombre de Dios.—San Patricio County; rises in western part of county; flows southeasterly and southwesterly 7 miles into Nueces River.

Arroyo Palo Alto.—Victoria County; rises in the central part of County; flows southeastward 6 miles into Union Creek, thence to Lavaca and Matagorda bays and thus to the Gulf of Mexico.

[illegible] stream in southeastern part [illegible] southerly [illegible] map.

[illegible] southwestern part [illegible] tributary [illegible] south of [illegible].

[illegible] stream in southwestern part of [illegible] 5 miles into [illegible] topographic map.

[illegible] southeastern part [illegible] of Boquillas. Chisos [illegible].

[illegible] part of the county; flows [illegible].

[illegible] miles southeast of [illegible] Creek (tributary [illegible] map.

[illegible] part of county; flows northward [illegible] River to [illegible] miles east of [illegible].

[illegible] northwestern part of [illegible] flows southeasterly 13 [illegible] River (tributary to [illegible] River) about 3 [illegible] county. Weather-[illegible].

Atascosa River—[illegible] rises in northwestern corner [illegible] miles through Atascosa County [illegible] into Frio River (tributary to Nueces River) near Three Rivers.

A[illegible] Creek—[illegible] in the west central part of the county; flows [illegible] miles into West San Jacinto River (tributary to San Jacinto River and thus through [illegible] Bay to Gulf of Mexico).

A[illegible] Bayou—Rusk, [illegible] and San Augustine counties; rises 3 miles east of [illegible] in the southeastern part of Rusk County; flows southeasterly [illegible] miles into Angelina River (tributary to Neches River) at the southeastern corner of Nacogdoches County near the St. Louis Southwestern Railway crossing.

A[illegible] Creek—Sabine County; flows easterly 3 miles into Sabine River in the southeastern part of county.

Austin Bayou—Brazoria County; rises near R[illegible] in the north central part of the county; flows southeasterly [illegible] miles into Bastrop Bay and thus to the Gulf of Mexico.

Autumn Creek.—Motley County; rises in the southeastern part; flows northeasterly 6 miles into Salt Creek (tributary through South Pease and Middle Pease rivers to Pease River and thus through Red River to the Mississippi).

Avary Canyon.—Brewster County: flows into Tornillas Creek (tributary to Rio Grande) 15 miles northwest of Boquillas in southern part of county. Chisos Mountains topographic map.

Avarillas.—Atascosa County; a small stream flowing southeasterly 6 miles into Atascosa River (tributary through Frio River to the Nueces) in the northern part of the county, near Coughran.

Ayish Bayou.—San Augustine and Jasper counties; rises about 5 miles north of the town of San Augustine in San Augustine County; flows southerly 40 miles into Angelina River (tributary to Neches River) in northwestern part of Jasper County.

Babyhead Creek.—Llano County; an intermittent stream flowing into Pecan Creek (tributary through Llano River to the Colorado) 6 miles east of Valley Spring in the northern part of the county; length, 9 miles. Llano topographic map.

Backbone Creek.—Burnet County; small stream rising 3 miles north of Fairland in the southern part of the county; flows southward 10 miles into Colorado River at Marble Falls. Burnet topographic map.

Baer Creek.—Sabine and Jasper counties; rises near Bronson in the southwestern part of Sabine County; flows southerly into Ayish Bayou (tributary to Angelina River, and thus to the Neches) in northern part of Jasper County.

Bailey Creek.—Clay County; an intermittent stream flowing into Red River (tributary to the Mississippi) northeast of Byers in northern part of county.

Bailey Creek.—Brazoria County; rises in western part of county; flows southeasterly 5 miles into Varners Creek (tributary to Brazos River) south of Damon.

Bailey Branch.—Fisher and Stonewall counties; rises 4 miles west of Hitson in northeastern part of Fisher County; flows northerly 8 miles into Double Mountain Fork of Brazos River (tributary to Bazos River) in southern part of Stonewall County. Roby topographic map.

Baker Creek.—Cass County; rises about 1½ miles north of Lanark in northeastern part of county; flows northeasterly 9 miles into Baker Slough, an expansion of Baker Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 1½ miles east of Alamo Mills. Texarkana and Atlanta topographic maps.

Baker Creek.—Hardeman County; a stream 7 miles long flowing eastward through northwestern part of county and discharging into Red River (tributary to the Mississippi).

Bakers Lake.—Harris County; 3½ miles west of Crosby in eastern part of county; small. Crosby topographic map.

Baker Slough.—Cass County; about 2 miles east of Alamo Mills; an arm of Long Slough (tributary to Sulphur River and thus through Red River to the Mississippi). Texarkana topographic map.

Balcones Creek.—Kendall, Bexar, and Bandera Counties; rises southwest of the town of Boerne in the eastern corner of Bandera County; flows easterly 8 miles along the boundary of Kendall and Bexar counties for practically this entire distance; joins Rio Cibolo (tributary through San Antonio River to the Guadalupe) north of Van Raub.

Balcon Creek.—Terrell County; rises in southwestern part about 2 miles southeast of Taylors ranch; flows southeasterly 4½ miles into Indian Creek (tributary to Rio Grande) near Johnsons ranch; intermittent. Dryden Crossing topographic map.

Baldridge Creek.—Gonzales County; rises near Waelder; flows southeasterly 9 miles into Peach Creek (tributary to Guadalupe River). Flatonia topographic map.

Ballard Creek.—Cass County; a small intermittent stream connecting with Shoal Creek (tributary through Sulphur River to Red River and thus to the Mississippi) about 3½ miles northeast of Douglasville in northern part of county. Linden topographic map.

[illegible]

[illegible] County: rises 2 miles northwest of the [illegible] flows northwesterly 11 miles [illegible] to Red River, which discharges into the Missi[illegible] in northern part of county. [illegible]

[illegible] rises about 2 miles south of [illegible] flows south[illegible] [illegible] tributary to Sulphur River and thus [illegible] about 3 miles east of Redwater. [illegible]

[illegible] County small stream flowing north 4 miles into [illegible] of Red River (tributary to Red River and thus [illegible] in [illegible] part of county.

BARRONS CREEK.—Gillespie County; flows southeasterly 15 miles through the town of Fredericksburg into Pedernales River (tributary to the Colorado) 4 miles southeast of Fredericksburg, in the southern part of the county. Fredericksburg topographic map.

BARTON CREEK.—Hays and Travis counties; rises 4 miles northwest of Dripping Springs, in the northern part of Hays County; flows easterly 9 miles through Hays County, then 25 miles through Travis County into Colorado River in the southwestern part of the City of Austin; gaging station maintained at Austin. Blanco and Austin topographic maps.

BARTON CREEK.—Donley County; rises about 3 miles west of Evans in the northern part of county; flows southeasterly 11 miles into Saddlers Creek (tributary to Salt Fork of Red River, thence to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

BARTON CREEK, SALT FORK.—Erath County; rises 1 mile south of Twin Mountains in northern part of county; flows northerly 5 miles into Barton Creek (tributary to Palo Pinto Creek and thus to Brazos River) 2 miles east of Washout Mountain. Stephenville topographic map.

BARTON CREEK.—Palo Pinto and Erath counties; rises 6 miles southwest of Wyleyville in northern part of Erath County; flows northerly 21 miles into Palo Pinto Creek (which discharges into Brazos River) one mile northwest of Coalville. Stephenville and Palo Pinto topographic maps.

BARTON CREEK.—Gonzales County; small tributary to Guadalupe River in the eastern part of the county.

BARTON'S CREEK.—Dewitt County; rises in northern part of county near Hochheim; flows into Queens Creek (tributary to Guadalupe River).

BASON MILL CREEK.—Red River County; rises about 9 miles north of Clarksville in northern part of county; flows northeasterly into Red River (tributary to the Mississippi) 1½ miles northwest of Mound City; length 9 miles.

BASFORDS BAYOU.—Galveston County; rises near Arcadia in the southwestern part of the county; flows southeasterly 5 miles into West Galveston Bay and thus to Gulf of Mexico.

BASS CREEK.—Gonzales County; rises east of the town of Gonzales; flows into Kerr Creek (tributary to Guadalupe River); intermittent. Flatonia topographic map.

BASSETT OR BLYTHE CREEK.—Bowie County; rises about 2 miles northeast of Dalby Springs in western part of county; flows southeasterly 13 miles into Sulphur River (which discharges into the Mississippi through Red River) about 2 miles south of Berry.

BASTROP BAYOU.—Brazoria County; rises in the central part of the county; flows southeasterly 13 miles into Austin Bayou, thence to Gulf of Mexico through Bastrop Bay.

BATES CREEK.—Comal County; near Crane's Mill; small intermittent stream flowing through northern part of county into Guadalupe River.

BATTLE CREEK.—Armstrong, Briscoe, and Hall counties; rises near Paloduro in southeastern part of Armstrong County; flows southeasterly 12 miles into Prairie Dog Town Fork of Red River (tributary to Red River, which discharges into the Mississippi) in northwestern part of Hall County near the western county line

BATTLE CREEK.—Shackelford, Stephens, and Callahan counties; rises in north east corner of Callahan County; flows northeasterly 18 miles into Bear Creek (tributary through Sandy Creek to Hubbard Creek, thence through Gonzales Creek to Clear Fork of Brazos and Brazos rivers) near Shady Grove. Albany topographic map.

Bayou Visitador.—Nacogdoches County; rises in the eastern part; flows southerly 17 miles into Angelina River (tributary to the Neches) in the southeastern part of the county.

Bayou Wander.—Nacogdoches County; rises in northeastern part of county; flows southeasterly 11 miles into Naconichi Bayou and thus through Attoyac Bayou to Angelina and Neches rivers.

Beach Branch.—Cass County; rises 3 miles northwest of Linden in central part of county; flows southeastward into Jims Bayou (tributary through Frazier Creek to Caddo Lake and thus through Red River to the Mississippi).

Beach Creek.—Cass County; rises about a mile east of Grogans Mill in the central part of county; flows easterly 5 miles into Black Bayou (tributary to Caddo Lake and thus to Red and Mississippi rivers) near Arnolds sawmill, 4 miles northeast of Bivins.

Bead Mountain Creek.—Coleman County; small stream rising west of Valera in the western part of county north of Bead Mountain; and flowing southeasterly 5 miles into Home Creek (tributary to the Colorado). Ballinger topographic map.

Beane Creek.—Hunt County; rises about 7 miles northwest of Greenville; flows southeasterly 18 miles into Caddo Fork of Sabine River (tributary to Sabine River).

Beane Creek, East Fork of.—Hunt County; rises 6 miles northwest of the town of Greenville; flows southerly into Beane Creek, thence through Caddo Fork of the Sabine to Sabine River.

Bear Bayou.—Shelby County; small stream flowing into Attoyac Bayou (tributary to Angelina River and thus to the Neches) in western part of the county.

Bear Branch.—Gonzales County; rises in northeastern part of county; flows into Peach Creek (tributary to Guadalupe River) northwest of Moulton; intermittent. Flatonia topographic map.

Bear Creek.—Angelina County; rises about 5 miles southwest of Homer; flows southerly 11 miles into Neches River.

Bear Creek.—Brewster County; rises in eastern part about 3 miles southwest of Gage ranch; flows southwesterly into an unnamed creek and thus to Rio Grande; intermittent. Dove Mountain and Bone Spring topographic maps.

Bear Creek.—Comal County; An intermittent stream near Sattler in central part of county; empties into Guadalupe River.

Bear Creek.—Cass County; rises 2 miles west of Munz in northwestern part of county; flows southwesterly 8 miles into Kelley Creek (tributary to Black Cypress Bayou, thence through Big Cypress Bayou and Caddo Lake to Red River and thus to the Mississippi). Daingerfield topographic map.

Bear Creek.—Collin County; formed 3 miles east of Blue Ridge by union of Little Bear and Indian creeks; flows southwesterly 5 miles into Pilot Grove Creek (tributary through Sister Grove Creek to East Fork of Trinity River and thus to the Trinity) about 2 miles south of Blue Ridge.

Bear Creek.—Dallas and Ellis counties; rises near De Soto in southern part of Dallas County; flows southeasterly 18 miles into Red Oak Creek (tributary to Trinity River) in the northeastern part of Ellis County. Dallas topographic map.

Bear Creek.—Eastland County; rises 5 miles southwest of Round Mountain in northeastern part of county; flows northeasterly 9 miles into South Palo Pinto Creek (tributary to Palo Pinto Creek and thus to Brazos River) in northeast corner of county. Eastland topographic map.

BEAR CREEK.—Williamson and Burnet counties; rises 2 miles northwest of Bertram in eastern part of Burnet County; flows northeasterly 10 miles into North Fork of San Gabriel River (tributary through San Gabriel River to Little River and thus to the Brazos) 3 miles south of Gabriel Mills. Burnet and Georgetown topographic maps.

BEAR OR GUM CREEK.—Upshur County; rises about 4 miles west of Coffeyville in northeastern part of county; flows southerly 9 miles to Little Cypress Creek (tributary to Caddo Lake, which discharges into Mississippi River through Red River) west of Graceton.

BEAR CREEK.—Wichita and Clay counties; rises in northeastern part of Wichita County; flows easterly 2 miles into Wichita River (tributary to Red River and thus to the Mississippi) in northwestern part of Clay County.

BEAR CREEK.—Washington County; rises 2 miles northwest of Gay Hill; flows northerly 2½ miles into Wolf Creek (tributary to Yegua Creek and thus to Brazos River).

BEARS FOOT CREEK.—Runnels County; an intermittent tributary to Colorado River east of Ballinger in the southern part of the county; length, 5 miles. Ballinger topographic map.

BEARHEAD CREEK.—Cooke County; rises about a mile southwest of the town of Sivells Bend in northern part of county; flows southeasterly 5 miles into Fish Creek, thence to Red River and thus to the Mississippi. Gainesville topographic map.

BEAR-PEN CREEK.—Franklin County; rises one-half mile south of Mount Vernon in central part of county; flows northerly 7 miles into Whiteoak Bayou (tributary to Sulphur River, which discharges into the Mississippi through Red River).

BEAR-PEN CREEK.—Collin and Hunt counties; rises at Nevada in Collin County; flows southeasterly 15 miles into Bluff Creek (tributary to South Fork of the Sabine and Sabine Rivers) about 3 miles southwest of Quinlan in Hunt County.

BEAR SPRINGS BRANCH.—Llano County; an intermittent stream 6 miles in length flowing southeast of Castell in the western part of the county; connects with Lang Creek and thus to Llano River (tributary to Colorado River). Llano topographic map.

BEAR GULCH.—Caldwell County; small stream flowing to the southwest of Delhi, in eastern part of the county, into Sandy Fork of Peach Creek (tributary to Peach Creek and thus to the Guadalupe); intermittent. Flatonia topographic map.

BEASONS CREEK.—Grimes County; rises near Retreat; flows westerly 12 miles into Brazos River near western corner of Grimes and Waller Counties; Howth and Navasota topographic maps.

BEASOM OR BEASON CREEK.—Grimes County; rises in southern part of county; flows southwesterly 12 miles into Brazos River at the Grimes-Waller County line. Navasota and Howth topographic maps.

BEAVER CREEK.—Clay and Montague Counties; rises about 8 miles north of Bellevue in eastern part of Clay County; flows northeastward 14 miles into Red River (tributary to Mississippi River) 4 miles northeast of Ringgold, in northwestern part of Montague County. Montague topographic map.

BEAVER CREEK.—Anderson County; rises in northwestern part of county; flows southwesterly 11 miles into Catfish Bayou (tributary to Trinity River).

BEAVER CREEK.—Burnet County; a stream 8 miles long connecting with Colorado River 2½ miles northwest of Blufton in the northwestern part of the county. Burnet topographic map.

Beaver Creek.—Foard, Wilbarger, and Wichita counties; rises about 3 miles east of Foard City in southern part of Foard County; flows easterly 65 miles into Wichita River (tributary to Red River, which discharges into the Mississippi) about 7 miles south of Fowlkes in southwestern part of Wichita County.

Beaver Creek.—Grayson County; rises about a mile north of Southmayd in western part of county; flows northerly 5 miles into Mineral Creek (tributary to Red River and thus to the Mississippi) one mile southwest of Steedman. Denison topographic map.

Beaver Creek.—Gillespie and Mason counties; rises about 3 miles north of Harper in the northwestern part of Gillespie County; flows northeastward 28 miles into Llano River (tributary to the Colorado) 2 miles east of Hedwig's Hill in the eastern part of Mason County. Mason and Kerrville topographic maps.

Beaver Creek.—Leon County; a stream 5 miles long flowing easterly into Beaver Dam Creek (tributary to Trinity River) in eastern part of county.

Beaver Creek.—Van Zandt and Henderson counties; rises in the southeastern part of Van Zandt County; flows southerly into Kickapoo Creek (tributary to Neches River) in the northeastern part of Henderson County.

Beaver Creek.—Leon County; rises about 3 miles west of Centerville; flows easterly 7 miles into Keechi Creek (tributary to Trinity River).

Beaver Dam Creek.—Leon County; rises in central part of county; flows southeasterly 10 miles into Trinity River; about 5 miles above its mouth it spreads over extensive marshes formed by beaver dams.

Beaver Lake.—Val Verde County; formed 3 miles northeast of Juno and 8 miles south of Crocket and Val Verde County line by an expansion of Devils River (tributary to Rio Grande).

Beauchamps Creek.—Harris County; a small tributary in the central part of the county; flows 7 miles into Whiteoak Bayou and thus to Buffalo Bayou, Galveston Bay and Gulf of Mexico.

Becerra Creek.—Webb County; small intermittent stream flowing southerly 8 miles to its junction with Rio Grande approximately 15 miles south of the town of Laredo.

Beck Branch.—Hamilton County; a short intermittent stream in eastern part of county; rises near Cut Off Mountain; flows southerly 7 miles to a point 4½ miles northwest of Jonesborough, where it enters Leon River (tributary through Little River to the Brazos). Meridian topographic map.

Bedias Creek.—Montgomery County; rises in the west central part of the county; flows southerly and southwesterly 8 miles into Lake Creek (tributary to West San Jacinto River, San Jacinto River, and Gulf of Mexico).

Bee Branch.—Gonzales County; small stream in northern part of county; flows southerly 7 miles into Sandy Fork of Peach Creek (tributary through Peach Creek to Guadalupe River) east of Thomsonville; intermittent. Flatonia topographic map.

Bee Branch.—Falls County; a small intermittent stream flowing southerly 3 miles into Pond Creek (tributary to the Brazos) south of the village of Rupee. Temple topographic map.

Bee Branch.—Brown County; a small intermittent stream flowing through Blanket Creek into Pecan Bayou (and thus to the Colorado) south of Zephyr in the southeastern part of the county; length, 6 miles. Brownwood topographic map.

Bee Creek.—Bosque County; an intermittent stream flowing southeasterly 7 miles into Meridian Creek (tributary to Bosque River and thus to the Brazos) south of the town of Meridian. Meridian topographic map.

Bee Creek.—Brazos County; a stream 6 miles long flowing northeasterly into Big Cedar Creek (tributary to Navasota River and thus to the Brazos).

Bee Creek.—Caldwell and Bastrop counties; a small stream flowing northward from Taylorsville in the northern part of Caldwell County, and connecting with Walnut Creek (tributary to Colorado River) in western part of Bastrop County. San Marcos and Flatonia topographic maps.

Bee Creek.—Ellis County; joins Pecan Creek (tributary to Richland Creek thence to Trinity River) in southwestern part of the county.

Bee Creek.—Cass County; rises about 2½ miles northwest of O'Farrell school; flows southeasterly into Johns Creek (tributary to Frazier Creek and thus through Caddo Lake and Red River to the Mississippi) about 2 miles north of Spring Hill in northern part of county; length, 6 miles.

Bee Creek.—Fort Bend County; rises in southern part of county; flows southeasterly 6 miles into Cow Creek (tributary to the Brazos).

Bee Creek.—Hood County; rises 2 miles southeast of Center Mill in northeastern part of county; flows southerly 6 miles into Brazos River 2½ miles northwest of Granbury. Weatherford and Granbury topographic maps.

Bee Creek.—Travis County; a small intermittent tributary to Colorado River just above the city of Austin in the central part of county; length, 3 miles. Austin topographic map.

Bee Creek.—Travis County; rises in the northwestern part of the county; flows 3 miles to its junction with Cow Creek (tributary to Colorado River). Burnet topographic map.

Beech Creek.—Nacogdoches and Rusk counties; rises in the northern part of Nacogdoches County; flows northwesterly 8 miles; connects with East Shawnee Creek (tributary to Angelina and Neches rivers) in Rusk County near the Rusk-Nacogdoches county line.

Beech Creek.—Van Zandt County; rises about 2 miles south of Canton; flows northeasterly 19 miles into Sabine River in the northeastern part of the county.

Beecham Branch.—Montague County; small intermittent stream flowing into Mallard Creek (tributary to Denton Creek, thence through Elm Fork of the Trinity to Trinity River) about 1½ miles northeast of Denver. Montague topographic map.

Bee Cove Creek.—Lampasas County; rises near Mills-Lampasas county line; flows northeasterly 6 miles into Simms Creek (tributary through Lampasas and Little rivers to the Brazos) in northern part of county. Lampasas topographic map.

Bee Caves Creek.—Kerr County; rises south of Vix in central part of county; tributary to North Fork of Guadalupe River, and thus to Guadalupe River. Kerrville topographic map.

Beef Canyon.—Brewster County; rises 4½ miles east of Horseshoe Mesa in eastern part of county; flows northeasterly 11 miles into San Francisco Creek and thus to Rio Grande; intermittent. Bullis Gap topographic map.

Beef Creek.—Jasper County; a small stream flowing through northern part of county into Angelina River (tributary to the Neches).

Beehouse Creek.—Coryell County; rises 3 miles southeast of Evant in western part of county; flows southeasterly 20 miles into Cowhouse Creek (tributary to Leon River and thus through Little River to the Brazos) one-half mile north of Pidcoke. Lampasas and Gatesville topographic map.

Belknap Creek.—Montague County; formed 4 miles northwest of Stoneburg by union of West and Middle Belknap Creeks; flows northeasterly 12 miles into Red River (tributary to the Mississippi) about 4 miles north of Belcherville. Montague topographic map.

BELL BRANCH.—Ellis County; small stream flowing to Cottonwood Creek (tributary through Mountain Creek to West Fork of Trinity River, thence to the Trinity) in northwestern part of county. Fort Worth topographic map.

BELL BRANCH.—Erath County; rises 2 miles northwest of Dublin; flows easterly 7 miles into Green Creek (which discharges into Brazos River through Bosque River) in the southern part of county. Stephenville topographic map.

BELL CREEK.—Ellis County; small stream flowing through southwestern part of county into Pecan Creek, thence to Richland Creek and Trinity River.

BELL HOLLOW.—Sutton County; a small intermittent stream 6 miles long in the southeastern part of the county; flows through North Llano River into Llano River (tributary to the Colorado). Fort McKavett topographic map.

BELLS SLOUGH.—Cass County; about 4½ miles northwest of Alamo Mills in northeastern part of county; an old channel of Sulphur River (tributary to Red River, which discharges into the Mississippi). Texarkana topographic map.

BEN BRANCH.—Gonzales County; rises west of Moulton in northeastern part of county; flows into Peach Creek and thus to Guadalupe River; intermittent. Flatonia topographic map.

BEN FORT CREEK.—Grimes County; formed by union of several small streams in north central part of county; flows southwestward 7 miles into Navasota River (tributary to the Brazos).

BENS HOLE CREEK.—Brewster County; small intermittent stream 6 miles long flowing southwesterly into Terlingua Creek (tributary to Rio Grande) 10 miles north of Terlingua Abaja in southern part of county. Terlingua topographic map.

BENTS CREEK.—Hutchison County; small intermittent stream 3 miles long flowing southerly into Canadian River (tributary to Arkansas River and thus to the Mississippi) 11 miles northeast of Plemons in eastern part of county.

BENNETT CREEK.—Lampasas and Mills counties; rise 2 miles southeast of Goldthwaite in southeastern part of Mills County; flows southeasterly 23 miles into Lampasas River (tributary through Little River to the Brazos) in the extreme northern part of Lampasas County. San Saba and Lampasas topographic maps.

BENNETTS CREEK.—Jack County; flows into Martins Creek (tributary to West Fork of Trinity River and thus to the Trinity) in the northeastern part of the county.

BENJAMIN CREEK.—Comal County; in northern part of county; small intermittent tributary to Guadalupe River.

BERKLEY CREEK.—Donley and Hall counties; rises in southeastern part of Donley County; flows southeasterly into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) about 4 miles west of Newlin in eastern part of Hall County.

BERRYS CREEK.—Erath County; a small stream flowing southeasterly 9 miles into Paluxy Creek (tributary to Brazos River) at Bluff Dale in northeastern part of county. Stephenville topographic map.

BERRY OR HICKORY CREEK.—Burleson County; rises 6 miles southeast of Caldwell; flows southeasterly 5 miles into Davidson Creek (tributary through Yegua Creek to Brazos River).

Berry Creek.—Williamson County; rises near Burnet-Williamson county line, 7 miles northwest of Florence in northwestern part of county; flows southeasterly 22 miles into San Gabriel River (tributary to Little River and thus to the Brazos) 4 miles northeast of Georgetown. Georgetown topographic map.

Bidais Creek.—Grimes, Madison, and Walker counties; rises near Iola in the northern part of Grimes County; flows circuitously northeastward 15 miles through Madison and Grimes counties to the northwestern corner of Walker County; then 19 miles along the boundary between Madison and Walker counties to a point north of Falba, where it enters Trinity River.

Big Aguja Canyon.—Jeff Davis County; rises near Black Mountain 10 miles northwest of Fort Davis, at an approximate altitude of 6,500 feet above sea level; flows northeasterly 12 miles, thence northerly 10 miles to its junction with Madero Canyon to form Toyah Creek (tributary to Pecos River and thus to Rio Grande). Principal tributary to Toyah Creek. Fort Davis topographic map.

Big Branch.—Stephens County; an intermittent stream rising 1 mile southwest of Gunsight and flowing northerly 9 miles into Gonzales Creek (tributary through Clear Fork of Brazos River to the Brazos) 7 miles south of Breckenridge. Breckenridge topographic map.

Big Boggy Creek.—Matagorda County; rises in the south central part of the county; flows southeasterly 12 miles into Matagorda Bay and thus to the Gulf of Mexico.

Big Blue Creek.—Dallam, Sherman, Moore, and Hutchinson counties; rises in southeastern part of Dallam County, crosses the southwestern corner of Sherman County, and flows southeasterly across Moore County to a point 6 miles northwest of Isom in southwestern part of Hutchinson County, where it enters Canadian River (tributary through the Arkansas to the Mississippi); length, 50 miles.

Big Brushy Creek.—Dewitt and Lavaca counties; rises near Yoakum in the northern part of Dewitt County; flows southeastward 5 miles through Dewitt County, then 18 miles through Lavaca County into Lavaca River tributary to Matagorda Bay and thus to Gulf of Mexico.

Big or Barkman Creek.—Bowie County; rises near Whaleys in northern part of county; flows easterly 25 miles to its intersection with the Texas-Arkansas boundary line at Carbon, thence southerly through Miller County, Arkansas into Red River (tributary to the Mississippi). New Boston and Texarkana topographic maps.

Big Creek.—Franklin County; rises about 6 miles southwest of Mount Vernon; flows northerly 11 miles into Whiteoak Bayou (tributary to Sulphur River, thence to Red River and the Mississippi).

Big Creek.—Fort Bend County; rises south of Rosenberg; flows southeasterly 25 miles into Brazos River in southeastern part of county.

Big Creek.—Falls and Limestone counties; rises 10 miles northwest of Groesbeck in southwestern part of Limestone County; flows southwestward into Brazos River near Highbank in southern part of Falls County.

Big Creek.—Hunt County; rises in northeastern part of county; flows southeasterly 4 miles into South Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi).

Big Creek.—San Jacinto and Liberty counties; rises near Cold Springs in the central part of San Jacinto County; flows southeasterly 20 miles through San Jacinto County, then 2 miles through Liberty County, joining Trinity River near its intersection with the north line of Liberty County.

BIG CREEK.—Brazos County; rises 2 miles northwest of Allen Farm in southern part of county; flows easterly 18 miles into Navasota River (tributary to the Brazos) 3 miles west of the town of Navasota; intermittent. Gay Hill and Navasota topographic maps.

BIG CREEK.—Jasper County; rises about 6 miles south of Jasper; flows southwesterly 11 miles into Neches River.

BIG CREEK.—Lee County; a small intermittent stream flowing southwestward 5 miles into Second Yegua Creek (tributary through Yegua Creek to Brazos River) west of Lexington. Bastrop topographic map.

BIG BEAR CREEK.—Tarrant and Dallas counties; rises about 3 miles west of Keller in Tarrant County; flows southeasterly 25 miles into West Fork of Trinity River (tributary to Trinity River) about 3 miles northeast of Grand Prairie, in western part of Dallas County. Fort Worth and Dallas topographic maps.

BIG CADDO CREEK.—Palo Pinto and Stephens counties; rises 5 miles north of Ranger in southeastern part of Stephens County; flows northeasterly 32 miles into Brazos River at the Horseshoe Bend in northwest corner of Palo Pinto County. Breckenridge topographic map.

BIG CEDAR CREEK.—Brazos and Robertson counties; rises near Franklin in central part of Robertson County; flows southeasterly 24 miles into Navasota River (tributary to the Brazos) east of Edge, about a mile north of Madison-Grimes county line.

BIG CANYON.—Brewster County; rises in southwestern part; flows northeasterly 4½ miles into Rio Grande; intermittent. Maravillas Canyon and Reagan Canyon topographic maps.

BIG CEDAR CREEK.—Stephens and Palo Pinto counties; rises 3 miles southwest of La Casa and 2 miles southeast of Steel Essy Mountain in southeastern part of Stephens County; flows northeasterly 37 miles into Brazos River at the Horseshoe Bend in northwest corner of Palo Pinto County, 5 miles east of Yanceyville. Breckenridge topographic map.

BIG COW CREEK.—Newton County; rises in northwestern corner of county; flows southeasterly 43 miles through the county into Sabine River about 5 miles south of Belgrade.

BIG CYPRESS CREEK.—Harris County; rises in western part of county near Waller-Harris county line; flows easterly 17 miles into Cypress Creek (tributary to Spring Creek, thence to San Jacinto River and thus through Galveston Bay to Gulf of Mexico); intermittent. Swanson, Cypress and Ashford topographic maps.

BIG CYPRESS BAYOU OR CREEK.—Hopkins, Franklin, Titus, Morris, Camp, Upshur, and Marion counties; rises in southeastern part of Hopkins County about 4 miles east of Carrols Prairie; flows southeasterly 10 miles into Caddo Lake (tributary to Red River and thus to the Mississippi) about 4 miles east of Jefferson in southern part of Marion County.

BIG CYPRESS CREEK.—Jasper and Newton counties; rises about 2 miles northeast of Bessmay in Jasper County; flows southeasterly 20 miles; enters Sabine River in Newton County at Deweyville.

BIG EDDY.—Harris County; 3½ miles west of Crosby; an arm of San Jacinto River; tributary to San Jacinto River and thus to the Gulf of Mexico; length, three-fourths of a mile. Harmaston and Crosby topographic maps.

BIG CYPRESS CREEK.—Tyler and Hardin counties; rises about 9 miles northwest of Woodville in Tyler County; flows southeasterly 32 miles into Alabama Creek (tributary to Neches River) about 4 miles east of Village Mills in Hardin County.

BIG ELM OR ELM CREEK.—McLennan, Bell, and Milam counties; rises at the town of Moody in southern part of McLennan County; flows southeasterly 55 miles into Little River (tributary to Brazos River) 2 miles northeast of Cameron in central part of Milam County. Temple and Taylor topographic maps.

BIG FIVEMILE CREEK.—Fayette and Gonzales counties; rises in the town of Flatonia; flows southwesterly 7 miles through Fayette County, then 4 miles through Gonzales County into Peach Creek (tributary to Guadalupe River). Flatonia topographic map.

BIG FOSSIL CREEK.—Tarrant County; rises about a mile north of Calef; flows southeasterly 16 miles into West Fork of Trinity River (tributary to the Trinity) about 5 miles northeast of Fort Worth, near center of the county. Fort Worth topographic map.

BIG GAP CREEK.—Donley and Collingsworth counties; rises in northeastern part of Donley County; flows southeasterly 7 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi) in Collingsworth County about 2 miles east of the western boundary of the county.

BIG GRAPE CREEK.—Kent, Garza, and Scurry counties; rises in northwest corner of Scurry County; flows northerly along Kent-Garza county line into Double Mountain Fork of Brazos River (tributary to the Brazos) northwest of Polar.

BIG HILL BAYOU.—Jefferson County; rises 8 miles southwest of Port Arthur in eastern part of the county; flows easterly and northerly 8 miles into Taylors Bayou (tributary through Sabine Lake to Gulf of Mexico) 5 miles west of Port Arthur; tidal.

BIG LAKE.—Bowie County; about 6 miles north of Leary in northeastern part of county; inlet, Collums Spring Branch; outlet, Red River (tributary to Mississippi River); formerly a channel of Red River.

BIG ISLAND SLOUGH.—Harris County; rises 4 miles northwest of LaPorte; flows southerly 7 miles into Middle Bayou (tributary to Clear Lake and thus to Gulf of Mexico); partially intermittent. La Porte and Seabrook topographic maps.

BIG LAKE (MCFARLAND LAKE).—Bowie County; about 4 miles south of Maud in southern part of county; formed by an old channel of Sulphur River, which discharges into the Mississippi through Red River. New Boston topographic map.

BIG LAKE.—Cass County; about 5½ miles west of Alamo Mills in northeastern part of county; formed by an old channel of Sulphur River (tributary through Red River to the Mississippi). Texarkana topographic map.

BIG LUCY LAKE.—Lampasas County; rises 4 miles west of Ogle station in southern part of county; flows southeasterly to a point about 2 miles south of Grundyville where it enters Lampasas River (tributary to Little River and thus to the Brazos). Lampasas topographic map.

BIG MUSTANG CREEK.—Red River County; rises near Lamar-Red River county line in southwestern part of county; flows southeasterly 16 miles into Sulphur River and thus through Red River to the Mississippi.

BIG MOUNTAIN CREEK.—Mills and Comanche counties; a stream flowing northeasterly 13 miles into Little Mountain Creek (tributary through South Leon Creek to Leon River, thence through Little River to the Brazos) 3 miles southwest of Fleming. Brownwood topographic map.

BIG BRANCH.—Stephens County; small intermittent stream flowing westerly 4 miles into Gonzales Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) north of Breckenridge. Breckenridge topographic map.

Bitter Creek.—DeWitt County; small tributary to Sandies Creek and thus to Guadalupe River in western part of county.

Bitter Creek.—King County; a small stream rising in northeastern part of county and flowing easterly 7 miles into Ox Yoke Creek (tributary to South Wichita River and thus through Wichita and Red rivers to the Mississippi).

Bitter Branch.—Fayette County; southeast of Cistern in the western part of the county; small intermittent stream 3 miles in length flowing into Live Oak Creek (tributary to Buckner Creek and thus to Colorado River). Flatonia topographic map.

Bitter Creek.—Jones and Taylor counties; rises 4 miles southeast of Trent in northwestern part of Taylor County; flows northeasterly 23 miles into Clear Fork of Brazos River (tributary to the Brazos) 3 miles southeast of Nugent in northern part of Jones County. Sweetwater, Roby, and Anson topographic maps.

Bitter Creek.—Donley and Hall counties; rises in southern part of Donley County; flows southwesterly 3½ miles into Mulberry Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in northwestern part of Hall County.

Bitter Creek.—Nolan County; rises at Nolan; flows northerly 21 miles into Sweetwater Creek (tributary through Clear Fork of Brazos River to the Brazos) 1 mile west of Eskota; intermittent. Sweetwater and Roby topographic maps.

Bitter Creek.—King County; rises in northeastern part of county; flows southerly 6 miles into Ox Yoke Creek (tributary through South Wichita River to Wichita River and thus through Red River to the Mississippi).

Blackland Gully.—Harris County; rises 6½ miles northeast of Moonshine Hill; flows northeasterly 1½ miles into East Fork of San Jacinto River and thus to Gulf of Mexico, passing through San Jacinto, Trinity and Galveston bays; intermittent. Moonshine Hill topographic map.

Bitter Lake Creek.—Motley County; flows northerly 4 miles through northeastern part of county into Pease River (tributary to Red River, which discharges into the Mississippi) about 2 miles northwest of Northfield.

Blacks Bayou.—Jefferson County; small tidal stream about a mile northeast of Nederland flowing into Neches River.

Black Bayou.—Cass County, Tex. and Caddo Parish, La.; rises in northern part of Cass County about 6 miles northwest of Lanark; flows southeasterly 45 miles crossing the State boundary about 1 mile south of the intersection of Arkansas, Louisiana and Texas boundaries; enters Soda Lake (tributary to Red River and thus to the Mississippi) in Caddo Parish, La. Atlanta topographic map.

Black Cypress Bayou.—Morris, Cass, and Marion counties; rises 4 miles northeast of Daingerfield in eastern part of Morris County; flows southeasterly about 40 miles into Big Cypress Bayou (tributary to Caddo Lake, which discharges into Mississippi River through the Red) 3½ miles east of Jefferson in southern part of Marion County. Daingerfield topographic map.

Black Creek.—Cass County; an intermittent stream flowing northeasterly 8½ miles into Overcup Slough (tributary to Sulphur River and thus through Red River to the Mississippi) about 4 miles northwest of Douglasville. Linden topographic map.

Black Creek.—Medina and Frio counties; rises in the east central part of Medina County; flows southward 15 miles through Medina County, then 17 miles through Frio County into San Miguel Creek (then to the Nueces through Frio River); length, 32 miles.

BLACK CREEK.—Tyler County; small stream south of Warren in southern part of county; joins Wood Creek (tributary to Alabama Creek, and thus to Neches River) near southern county line.

BLACK FORK OF PRAIRIE CREEK.—Smith County; rises at Tyler; flows westerly 10 miles into Prairie Creek (tributary to Neches River).

BLACK HILL BRANCH.—Bexar County; near Atascosa in southwestern part of county; an intermittent tributary through Elm Creek to Medina River, and thus through San Antonio River to the Guadalupe. San Antonio topographic map.

BLACK HILLS CREEK.—Presidio County; small stream in southern part of county; flows southwesterly to its junction with Torneros Creek, thence one mile to Rio Grande, 7 miles southwest of Presidio; length, 18 miles; intermittent. Shafter topographic map.

BLACK HOLLOW.—Cooke County; small intermittent stream rising about 3 miles southeast of Marysville in northern part of county and flowing into South Fish Creek (tributary to Fish Creek and thus through Red River to the Mississippi). Gainesville topographic map.

BLACK JACK CREEK.—Fayette County; east of Muldoon in central part of the county; an intermittent tributary through Pinoak Creek to Buckner Creek and thus to Colorado River; length, 3 miles. Flatonia topographic map.

BLACK LAKE.—Gray County; western part; when overflowing joins North Fork of Red River (tributary to Red River and thus to the Mississippi); area about one-half square mile; prairie lake.

BLACK SPRING BRANCH.—Erath County; an intermittent stream 3 miles long flowing northeasterly into Little Green Creek (tributary to Green Creek and thus through Bosque River to the Brazos) south of Alexander in southern part of county. Stephenville topographic map.

BLACK LAKE.—Harris County; in the eastern part of county 3 miles southwest of Crosby; small. Crosby topographic map.

BLACKTAIL CREEK.—Briscoe and Armstrong counties; rises in northern part of Briscoe County; flows northerly 3 miles into Prairie Dog Town Fork of Red River (tributary to Red River, which discharges into the Mississippi) near the northern line of the county.

BLAKE CREEK.—Wise County; small tributary to Denton Creek (which discharges into Trinity River through Elm Fork of the Trinity) in the southeastern part of the county.

BLANCO CREEK.—Goliad, Karnes, and Bee counties; rises at a point near to the corner common to Goliad, Karnes, and Bee counties; flows southeastward 28 miles along the boundary of Goliad and Bee counties to its junction with El Sarco River (thence to Gulf of Mexico through Rio de la Mission and Copano bays) just above Blanconia.

BLANCO RIVER.—Kendall, Blanco, and Hays counties; rises east of Bankersmith in the northeastern part of Kendall County; flows southeasterly 7 miles through Kendall County, 19 miles through the southern part of Blanco County, then 38 miles through Hays County where it joins San Marcos River (tributary to Guadalupe River) about 2 miles southeast of San Marcos, southeastern part of Hays County. Fredericksburg, Blanco, Austin, and San Marcos topographic maps.

BLANCO RIVER.—Uvalde County; rises 5 miles northeast of Concan, in the northern part of the county; flows southerly 38 miles into Sabinal River (thence to the Nueces through Frio River) in southeast corner of county. Uvalde topographic map.

Blanco River, Cypress Fork of.—Hays County; flows southerly 20 miles south of Mount Sharp into Blanco River (tributary to San Marcos River and thus to the Guadalupe) in western part of county. Blanco topographic map.

Bland Creek.—Red River County; rises about 2 miles southeast of Bagwell; flows southwesterly 6 miles into Bruton Creek (tributary to Guest Creek and thus through Cuthand Creek, Sulphur and Red rivers to the Mississippi).

Blanket Creek.—Comanche, Brown, and Mills counties; rises 10 miles west of Comanche in southwestern part of Comanche County; flows southerly 30 miles into Pecan Bayou (tributary to the Colorado) 6 miles southwest of Mullen. Brownwood topographic map.

Bliss Branch.—Leon County; rises about 4 miles northeast of Jewett; flows northeasterly 11 miles into Buffalo Creek (tributary to upper Keechi Creek, thence to Trinity River) about 2 miles southwest of Keechi.

Blocker Creek.—Cooke County; joins Clear Creek (tributary to Elm Fork of Trinity River, and thus to the Trinity) in southwestern part of county; intermittent. Gainesville topographic map.

Block Creek.—Kendall County; rises in northwestern part of county; flows southerly into Guadalupe River. Fredericksburg topographic map.

Bloomfield Branch.—Stephens County; small intermittent stream flowing into Clear Fork of Brazos River and thus to the Brazos in northern part of county northwest of Crystal Falls. Breckenridge topographic map.

Blue Branch.—Bastrop County; small intermittent stream 3 miles long flowing into Colorado River 3 miles southeast of Bastrop in the central part of the county. Bastrop topographic map.

Blue Branch.—Coryell County; small stream flowing northeasterly 5 miles into Leon River (tributary through Little River to the Brazos) 4 miles northwest of Gatesville in central part of county. Gatesville topographic map.

Blue Branch.—Lee County; rises at Foot of Yegua Knobs; flows northerly 5 miles into Second Yegua Creek (tributary through Yegua Creek to Brazos River) in western part of county. Bastrop topographic map.

Blue Creek.—Brewster County; an intermittent stream in southern part of the county; rises on the western slopes of Chisos Mountains; flows southwestward 17 miles into Rio Grande 8 miles southeast of Terlingua Abaja. Terlingua and Chisos Mountains topographic maps.

Blue Creek.—Guadalupe and Wilson counties; rises in the southwestern part Guadalupe County; flows southwesterly 10 miles through Guadalupe County, then 2 miles through Wilson County where it joins Rio Cibolo (tributary to San Antonio River and thus to the Guadalupe) 5 miles north of Sutherland Springs.

Blue Creek.—Wharton and Matagorda counties; small tributary which rises near El Campo in southern part of Wharton County; unites with Colorado River in northern part of Matagorda County; length, 13 miles.

Bluff Canyon.—Val Verde County; an intermittent stream in the eastern part of county; flows westward into Dry Devil's River (tributary to Devil's River and thus to Rio Grande).

Bluff Creek.—Briscoe and Hall counties; rises in the eastern part of Briscoe County; flows easterly 5 miles into Little Red River (tributary to Prairie Dog Town Fork of Red River, which discharges into the Mississippi through Red River) at its intersection with west line of Hall County.

Bluff Creek.—Collin, Rockwall, and Hunt counties; rises about 3 miles southwest of Nevada in Collin County, flows southeasterly 18 miles into South Fork of Sabine River (thence to Sabine River) in Hunt County, 4 miles south of Quinlan.

Bluff Creek.—Coleman County; a stream 7 miles long in the northwestern part of the county; flows through Jim Ned Creek into Pecan Bayou and thus to Colorado River. Ballinger and Coleman topographic maps.

Bluff Creek.—Edwards County; a small intermittent tributary flowing northwesterly 5 miles into West Nueces River and thus to the Nueces in the southern part of the county. Nueces topographic map.

Bluff Creek.—Hopkins County; northeastern part; small tributary to Crosstimber Creek (which discharges into Sulphur River through Whiteoak Bayou, thence through Red River to the Mississippi).

Bluff Creek.—Lee and Bastrop counties; rises near Paige on Houston & Texas Central Railroad in eastern part of Bastrop County; flows northeasterly 7 miles into Third Yegua Creek (tributary through Second Yegua Creek to Yegua Creek and thus to the Brazos) in central part of Lee County. Bastrop topographic map.

Bluff Creek.—McCulloch County; a stream 7 miles long flowing through the northern part of the county into Colorado River. Brady topographic map.

Bluff Creek.—McLennan and Coryell counties; rises 2 miles southwest of Coryell City; flows easterly 12 miles into Middle Bosque River (tributary through South Bosque and Bosque rivers to the Brazos) 2 miles northwest of Crawford in western part of McLennan County. Meridian and Waco topographic maps.

Bluff Creek.—Knox County; small stream flowing to a point northwest of Truscott in northern part of county, where it enters North Wichita River, thence to Wichita River and thus through the Red to Mississsippi River.

Bluff Creek.—Motley County; rises in the eastern part; flows easterly 6½ miles into South Pease River (tributary to Middle Pease River, thence through Pease to Red River and thus to the Mississippi) about 1 mile from the eastern border to the county.

Bluff Creek.—Shackelford County; rises 8 miles west of Albany; flows northwesterly 12 miles into Clear Fork of Brazos River (tributary to the Brazos) in northwestern part of the county. Anson and Albany topographic maps.

Bluff Creek, East Fork.—Wilbarger and Wichita counties; rises in western part of Wilbarger County, 2½ miles west of Electra; flows southerly, meandering across Wilbarger-Wichita county line into Beavers Creek, and thus to Wichita River; intermittent. Electra topographic map.

Bluff Creek, West Fork.—Wilbarger County; rises in northeastern part 4 miles southeast of Electra; flows southeasterly into Bluff Creek, thence to Beavers Creek, tributary to Wichita River; intermittent. Electra topographic map.

Bluff Creek.—Taylor and Runnels counties; rises 5 miles north of Mount Moro in southwestern part of Taylor County; flows southeastward 28 miles into Elm Creek (tributary to the Colorado) 5 miles northeast of Runnels in the central part of Runnels County. Sweetwater, Abilene, and Ballinger topographic maps.

Blundell Creek.—Franklin and Titus counties; rises about 3 miles south of Mount Vernon in eastern part of Franklin County; flows southeastward 13 miles into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) in southwestern part of Titus County.

Board Branch.—Eastland, Stephens, and Shakelford counties; rises in the northwest corner of Eastland County; flows northerly 4 miles into Battle Creek (tributary to Bear Creek and thus through Sandy, Hubbard, and Gonzales creeks to Clear Fork of Brazos River and thence to the Brazos) west of Indian Knoll. Albany topographic map.

Boardinghouse Creek.—Bowie County; a small intermittent stream joining Sulphur River (tributary to Red River, which discharges into the Mississippi) about one-half mile west of Draper in southeastern corner of county. Texarkana topographic map.

Boartree Creek.—Montague County; small intermittent stream flowing into Red River (tributary to the Mississippi) west of Illinois Bend in northeastern part of county. Montague topographic map.

Bob Creek.—Stonewall and King counties; a small stream flowing southerly 5 miles into Salt Fork of Brazos River (tributary to Brazos River) at mouth of Dove Creek.

Boss Creek.—Dewitt County; a small tributary to Guadalupe River in southeastern part of county 7 miles southeast of Cuero.

Boss or Blackberry Creek.—Archer County; rises in northwestern part of county; flows northerly 4 miles into Wichita River (tributary to Red River and thus to the Mississippi), near the north line of Archer County.

Bodano Bayou.—Angelina County; a stream 9 miles long flowing southwesterly into Neches River southwest of Pollok in the northwestern part of the county.

Bofecillos Canyon.—Presidio County; rises in the southern part of county; flows westerly 8 miles where it empties into Rio Grande 4 miles northwest of Polvo. Polvo topographic map.

Boggy Branch.—Johnson and Ellis counties; small stream flowing 6 miles along the boundary of Johnson and Ellis counties into Onion Creek, thence to North Fork of Pecan, Pecan, and Richland creeks, and Trinity River. Cleburne topographic map.

Bog or Hog Creek.—Upshur County; southeastern part; flows northeastward 6 miles into Little Cypress Creek (tributary to Caddo Lake, which discharges into Mississippi River through the Red).

Boggy Creek.—Brazos County; an intermittent stream flowing southerly in southern part of county; joins Brazos River 1 mile north of Clay Lake. Gay Hill topographic map.

Boggy Creek.—Floyd and Motley counties; rises in eastern part of Floyd County about 1 mile from the eastern boundary of the county; flows easterly 6½ miles into Middle Pease River (tributary to Pease River and thus through Red River to the Mississippi) about 9 miles northwest of Matador in the western part of Motley County.

Boggy Creek.—Jasper County; rises about 5 miles south of the center of the county; flows southwesterly 9 miles into Neches River.

Boggy Creek.—Lavaca County; small intermittent tributary to Liveoak Creek (thence to Gulf of Mexico through Lavaca River and Matagorda Bay) in northwestern corner of county; flows southwesterly 5 miles. Flatonia topographic map.

Boggy Creek.—Lavaca County; a small stream flowing easterly into Lavaca River (tributary to Gulf of Mexico through Matagorda Bay) 4 miles northwest of the town of Hallettsville; length, 2 miles.

Boggy Creek.—Leon County; rises about 2 miles northeast of Flynn; flows easterly 23 miles into Trinity River at Commerce in southeastern corner of county.

Boggy Creek.—Morris County; rises about 4 miles northwest of Omaha in northern part of county; flows southerly 23 miles into Big Cypress Bayou (tributary to Caddo Lake and thus to Red and Mississippi rivers) about 8 miles south of Daingerfield.

BOGGY CREEK.—Red River County; rises about 3 miles northwest of Clarksville near center of county; flows southeasterly 12 miles into Cuthand Creek (tributary to Sulphur River, which discharges into the Mississippi through Red River).

BOGGY CREEK.—Travis County; rises 4½ miles northeast of Austin; flows southeasterly 7 miles into Colorado River; intermittent. Austin topographic map.

BOGGY CREEK.—Williamson County; flows northerly 6 miles into Brushy Creek (tributary to San Gabriel River and thus through Little River to the Brazos) 6 miles southwest of Thorndale. Bastrop and Taylor topographic maps.

BOGGY CREEK.—Williamson County; small intermittent stream flowing easterly 5 miles into Brushy Creek (tributary to San Gabriel River, which discharges into Brazos River through Little River) 2 miles northeast of Coupland. Bastrop and Taylor topographic maps.

BOGGY CREEK.—Wilbarger County; rises in south central part of county; flows southeasterly 7 miles into Beaver Creek (tributary to Wichita River and thus through the Red to Mississippi river).

BOGGY CREEK.—Wise County; rises south of Balsora; flows easterly 13 miles into West Fork of Trinity River (tributary to Trinity River) about 3 miles northeast of Paradise.

BOGGY CREEK.—Gonzales County; east of Waelder; small intermittent stream flowing into Baldridge Creek and thus through Peach Creek to Guadalupe River. Flatonia topographic map.

BOGGY CREEK.—Young and Throckmorton counties; rises in north central part of Throckmorton County; flows southeasterly 23 miles into the Brazos, 3 miles northwest of Proffitt in western part of Young County.

BOIS D'ARC CREEK.—Grayson, Fannin, and Lamar counties; rises about a mile from the Grayson-Fannin county line and 6 miles southwest of Savoy in eastern part of Grayson County; flows southeasterly 11 miles, then northeasterly 40 miles into Red River (tributary to the Mississippi) near Direct and northern Lamar-Fannin county line.

BONITA CREEK.—Potter County; rises in eastern part of county; flows northwesterly 10 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi).

B. O. BRANCH.—Fayette County; in the western part of the county; a small intermittent stream flowing south of Stellar 3 miles into Buckner Creek (tributary to Colorado River). Flatonia topographic map.

BOON SLOUGH.—Uvalde County; rises 8 miles north of Uvalde; flows southerly 6 miles to its junction with Cooks Slough (tributary to Nueces River through Leona and Frio rivers) at Uvalde station. Uvalde topographic map.

BOON CREEK.—Leon County; rises about 2 miles southwest of Oakwoods; flows southeasterly 9 miles into Trinity River about a mile north of Navarro.

BOON CREEK, SOUTHWEST FORK OF.—Leon County; small tributary to Boon Creek (which discharges into Trinity River) about 2 miles west of Navarro.

BOOTHE CREEK.—Bowie County; rises about 6 miles southwest of DeKalb in southwestern part of county; flows southerly 11 miles into Sulphur River (tributary to Red River and thus to the Mississippi) about 3 miles east of southwestern corner of county.

BORDEN CREEK.—Bastrop and Fayette counties; rises near Rosanky in the southern part of Bastrop County; flows northeasterly 15 miles into Colorado River in the western part of Fayette County, 2½ miles east of West Point. Flatonia topographic map.

Boregas Creek.—Sabine County; rises 5 miles northwest of Milam; flows southeasterly 10 miles into Palo Gaucho Bayou (tributary to Sabine River) about 3 miles northeast of Milam.

Boregas Creek, West Fork of.—Sabine County; rises about 5 miles northwest of Milam; flows southeasterly 6 miles into Boregas Creek (tributary through Palo Gaucho Bayou to Sabine River) at Milam.

Borrego Creek.—Wilson and Atascosa counties; rises in the western part of Wilson County; flows southeastward and southward 10 miles through Wilson County, then 25 miles through Atascosa County into Atascosa River (tributary to Frio and Nueces rivers) at Campbellton.

Bosque River.—Erath, Hamilton, Bosque, and McLennan counties; rises 5 miles south of Wyleyville in northern part of Erath County; flows generally southeasterly 115 miles through the towns of Stephenville, Hico, Iredell, and Meridian into Brazos River 3 miles northwest of Waco in the central part of McLennan County. Stephenville, Hamilton, Meridian, and Waco topographic maps.

Bourland or Drennan Creek.—Fannin and Lamar counties; rises about 1 mile southeast of Honey Grove in southeastern part of Fannin County; flows southeasterly 9 miles into North Sulphur River (tributary to Sulphur River, which discharges into the Mississippi through Red River) in southwestern part of Lamar County at the southern boundary of Lamar County.

Bow Creek.—Throckmorton County; a stream flowing northerly 5 miles into Millers Creek (tributary to the Brazos) in northwestern part of county.

Bowles Creek.—Rusk and Cherokee counties; rises about 2 miles east of Overton in Rusk County; flows southwesterly 21 miles; empties into Striker Creek (tributary to Angelina River and thus to the Neches) in southeastern part of Cherokee County.

Bowman Creek.—Cass County; rises about 4 miles north of the town of Linden in central part of county; flows into Colley Creek (tributary through Frazier Creek to Caddo Lake and thus through Red River to the Mississippi); very small; intermittent.

Bowries or Ninemile Creek.—Menard County; a stream 12 miles long rising in the central part of the county and flowing into the San Saba (tributary to Colorado River). Eden topographic map.

Bowling Green Creek.—Jackson and Calhoun counties; rises in the southern part of Jackson County; flows southerly 18 miles through Jackson and Calhoun counties into Kellers Bay, thence to Matagorda Bay and Gulf of Mexico.

Box Creek.—Anderson County; flows southwesterly 14 miles into Trinity River, west of Elkhart in southwestern part of county.

Brays Bayou.—Harris County; rises in the southern part of the county; flows northeasterly 26 miles into Ship Channel (Buffalo Bayou) (thus to Galveston Bay and Gulf of Mexico) about 1½ miles below "Turning Basin"; tidal stream for about 2 miles in its lower course. Alief, Bellaire, and Park Place topographic maps.

Braden Branch.—Montague County; joins Denton Creek (which discharges into Trinity River through the Elm Fork of the Trinity) southwest of Forestburg in southern part of county. Montague topographic map.

Bradshaw Branch.—Eastland and Brown counties; rises in southeastern part of Eastland County near Rising Star; flows southeasterly and southwesterly 12 miles into Hog Creek (tributary to Pecan Bayou and thus to Colorado River); partially intermittent. Eastland, Brownwood, and Coleman topographic maps.

Brady Creek.—Concho, McCulloch, and San Saba counties; rises 14 miles southwest of Eden in the southwestern part of Concho County at an approximate altitude of 2,300 feet above sea level; flows easterly 30 miles through Concho County, 37 miles through McCulloch County, then 10 miles through San Saba County into San Saba River (tributary to the Colorado) 10 miles southwest of Richland Springs. San Angelo, Eden, Brady, and San Saba topographic maps. (See San Saba River.)

Brazos River, Clear Fork of.—Young, Stephens, Shackelford, Throckmorton, Jones, and Fisher counties; one of the principal tributaries to Brazos River; rises 12 miles west of Roby in western part of Fisher County; flows northeasterly 180 miles into Brazos River 12 miles southwest of Graham in southern part of Young County; drainage area, 5,670 square miles; gaging station near Eliasville, about 6 miles above mouth of river. Roby, Anson, Albany, and Breckenridge topographic maps. (See Brazos River.)

Brazos River.—One of the principal streams of the State; having the greatest discharge and being the longest of any stream in the State; rises in Roosevelt, Curry, and Quay counties, N. Mex.; headwater streams, Clear Fork, Salt Fork, and Double Mountain Fork of Brazos River; the Double Mountain Fork and Salt Fork unite in notheastern part of Stonewall County, about 470 miles above its mouth, to form the main stream; flows southeastward through the lower "Panhandle" and central part of the State of Texas into the Gulf of Mexico at Quintana, east of the towns of Velasco and Freeport, in Brazoria County; length, approximately 840 miles; drainage area, 41,700 square miles, of which 600 square miles are in New Mexico; important tributaries, other than headwater streams, are Navasota, Yegua, Little Brazos, Little, and Bosque rivers. Principal towns along the main stream are Velasco, Freeport, Richmond, Waco, Glenrose, Graham, and Seymour.

Rice irrigation is carried on extensively in the lower valley, but on account of the erratic flow in the upper catchment only scattered tracts are irrigated.

Several small dams have been constructed for power development on the main stream and tributaries, but only small amounts of power are generated. A system of locks and dams has been constructed on the river by the United States Government, for the purpose of making it navigable below Waco. Gaging stations at College Station, Waco, Brazos, and Graham, on the main stream; Eliasville, on the Clear Fork; and Cameron, on Little River. Gaging station was maintained at Richmond, 1903 to 1906. Temple, Waco, Clebourne, Granbury, Weatherford, Palo Pinto, and Breckinridge topographic maps. See second report of Texas board of water engineers for list of certified filings for appropriation of water from this stream.

Brewster Creek.—Bell County; rises in northern part of the county 6 miles southwest of Moody; flows southeasterly 3 miles into Stampede Creek (tributary to Leon River); partially intermittent. Temple topographic map.

Brewster Creek.—Cooke County; a small intermittent stream flowing into Bearhead Creek (tributary to Fish Creek and thus through Red River to the Mississippi) southeast of Three Mounds. Gainesville topographic map.

Briar Branch.—Burleson and Milam counties; rises 6 miles southeast of Rockdale, in southern part of Milam County; flows southwestward 8 miles into Firt Yegua Creek (tributary through Yegua Creek to Brazoz River) near Milam-Burleson county line.

Briar Branch.—Harris County; rises three-fourths of a mile east of Hillendahl; flows easterly 2½ miles into Spring Branch (tributary to Buffalo Bayou and thus to Gulf of Mexico); intermittent. Hillendahl and Houston Heights topographic maps.

Briar Branch.—Wise, Parker, and Tarrant counties; a small stream flowing into West Fork of Trinity River (tributary to Trinity River) near the towns of Briar and New Hope and the corner common to Wise, Parker, and Tarrant counties. Weatherford topographic map.

Briar Creek.—Young County; a stream flowing southwesterly 5 miles into Flint Creek (tributary to Salt Creek and thus to Brazos River) 4 miles north of Graham.

Briar Creek.—Navarro County; small stream flowing into Richland Creek (tributary to Trinity River), in central part of county.

Brick House Gully.—Harris County; small stream in central part of county; flows easterly 6½ miles into Whiteoak Bayou (thence to Buffalo Bayou, Galveston Bay, and Gulf of Mexico). 1 mile southeast of Rosslyn. Hillendahl and Houston Heights topographic maps.

Bridge Creek.—Burleson County; a small intermittent stream flowing southeasterly 6 miles into Yegua Creek (tributary to Brazos River), in southeastern part of county. Gay Hill topographic map.

Bridge Creek.—Kaufman and Henderson counties; rises in southwestern part of Kaufman County near county line; flows southerly 8 miles into Trinity River near Buffalo, in Henderson County.

Bridge Creek.—Sabine County; rises about 5 miles west of Hemphill; flows southeasterly 5 miles into Housing Bayou (tributary to Sabine River) about 3 miles southwest of Hemphill.

Brier Creek.—Grayson County; a small intermittent stream flowing into Red River (tributary to the Mississippi) in extreme northwestern part of county. Denison topographic map.

Brindle Creek.—Brewster County; rises in the eastern part; flows southeasterly through Brindle Canyon into Maxen Canyon (tributary to San Francisco Creek and thence to Rio Grande); intermittent. Bullis Gap and Indian Wells topographic maps.

Brier Creek.—Montague County; an intermittent stream flowing into Big Sandy Creek (tributary to West Fork of Trinity River and thus to the Trinity) southwest of Bowie in the southwestern part of county. Montague topographic map.

Britton Canyon.—Terrell County; rises in southwestern part about 2 miles northwest of Loma Vista; flows southwesterly 6½ miles into Rio Grande; intermittent. Dryden Crossing topographic map.

Brockman Branch.—Dallas County; rises about 5 miles west of Richardson; flows southwesterly 9 miles into Elm Fork of Trinity River (tributary to Trinity River) about 2 miles south of Letot. Dallas topographic map.

Brooks Creek.—Wise and Denton counties; a stream flowing to a point east of the town of Decatur, where it enters Olivers Creek (tributary to Denton Creek, thence to Elm Fork of Trinity River and the Trinity).

Brooks or Lick Creek.—Bowie County; rises about 3 miles northwest of Sims; flows southeasterly 13 miles into Anderson Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about one-half mile north of mouth of Anderson Creek in southern part of county. New Boston topographic map.

Brougham or Blairs Creek.—Franklin County; rises in southwestern part of county; flows southeasterly 4 miles into Big Cypress Creek (tributary to Caddo Lake, which discharges into the Mississippi through Red River.)

Brown Creek.—Cass County; rises about 1½ miles southeast of Munz; flows northeasterly 6 miles into Powell Creek (tributary to Sulphur River, which discharges into the Mississippi through Red River) 2½ miles northwest of Douglasville. Linden topographic map.

Brown Creek.—Coryell County; a southerly flowing stream 7 miles long joining Cowhouse Creek (tributary to Leon River and thus through Little River to the Brazos) in the southern part of county west of New Sugar Loaf. Gatesville topographic map.

Brown Branch.—Coryell County; rises at Jackson Knob north of Killeen; flows northward 4 miles to Cowhouse Creek and thus through Leon and Little Rivers to the Brazos. Gatesville topographic map.

Brown Creek.—Mills County; a stream flowing north of Goldthwaite in the north central part of the county into Pecan Bayou and thus to the Colorado River; length, 15 miles. Brownwood and San Saba topographic maps.

Browns or Bitter Creek.—Young and Archer counties; rises in southwestern part of Archer County; flows southwesterly 8 miles into Brazos River near Spring Creek in northwestern part of Young County.

Brown Lake.—Donley County; 2½ miles northwest of Lelia; no outlet; very small; prairie lake.

Brush Creek.—Motley County; rises in eastern part of county; flows easterly 3 miles into Middle Pease River (tributary to Pease River and thus through the Red to Mississippi River) about 1½ miles north of Teepee City.

Brush Creek.—Colorado County; small tributary to Colorado River in the western part of the county; length, 3 miles.

Brushy Bayou.—Rockwall and Kaufman counties; rises near Chisholm in southern part of Rockwall County; flows southerly 21 miles into Cedar Creek (tributary to Trinity River) about 3 miles southwest of Kaufman in Kaufman County.

Brushy Creek.—Anderson County; small stream in the northeastern part of county flowing southeasterly 11 miles into Neches River about 1½ miles north of the International & Great Northern Railway bridge.

Brushy Creek.—Angelina County; rises about 2 miles south of Marion; flows southeasterly 6 miles into Angelina River (tributary to Neches River).

Brushy Creek.—Bastrop County; tributary through Sandy and Walnut creeks to Colorado River, in the south central part of county; length, 7 miles. Flatonia topographic map.

Brushy Creek.—Brazos County; rises about 5 miles north of Bryan in northern part of county; flows southeasterly 16 miles into Navasota River (tributary to Brazos River).

Brushy Creek.—Caldwell and Hays counties; rises about 3 miles east of Buda; flows southeasterly 8 miles through Hays County; then 3 miles through Caldwell County into Plum Creek (tributary to San Marcos and Guadalupe Rivers) about 3 miles east of Uhland. Austin and San Marcos topographic maps.

Brushy Creek.—Coke County; rises in the northeastern part of the county; flows 9 miles into Oak Creek and thus to the Colorado. Sweetwater topographic map.

Brushy Elm Creek.—Cooke County; rises 2 miles south of Tyler Bluff; flows southeasterly 14 miles into Elm Fork of Trinity River (tributary to Trinity River) about 2 miles southeast of Myra. Gainesville topographic map.

Brushy Creek.—Cooke and Grayson counties; rises about 2 miles south of Dexter in eastern part of Cooke County; flows easterly 11 miles into Mineral Creek (tributary to Red River and thus to the Mississippi) 3½ miles north of Steedman in northwestern part of Grayson County. Denison topographic map.

BRUSHY CREEK.—Delta County; formed about 5 miles east of Cooper in east central part of county by union of East and West Brushy creeks; flows southeasterly 3 miles into South Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi).

BRUSHY CREEK.—Donley and Hall counties; rises in southwestern part of Donley County; flows southerly 8 miles into Mulberry Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in northwestern part of Hall County.

BRUSHY CREEK.—Fannin County; small stream flowing into Bois d 'arc Creek (tributary to Red River and thus to the Mississippi) in southwestern part of county.

BRUSHY CREEK.—Fannin County; rises about 4 miles southeast of Dodd City in southeastern part of county; flows southerly 6 miles into North Sulphur River, thence to sulphur River, and thus through Red River to the Mississippi.

BRUSHY CREEK.—Guadalupe County; rises in the Mill Creek Hills; flows easterly 10 miles into San Marcos River (tributary to the Guadalupe) 2 miles southeast of Prairie Lea. San Marcos topographic map.

BRUSHY OR SUBLETTS CREEK.—Ellis County; small stream flowing to Red Oak Creek (tributary to the Trinity) in the northeastern part of county. Dallas topographic map.

BRUSHY CREEK.—Fannin County; rises 1½ miles north of Savoy in northwestern part of county; flows northeasterly 5 miles into Red River (tributary to the Mississippi).

BRUSHY CREEK.—Grimes, Waller, and Montgomery counties; rises in southern part of Grimes County; flows southeasterly 4 miles through Grimes County, 13 miles through Waller County, then 3 miles through Montgomery County into Spring Creek (tributary to West San Jacinto River, then through San Jacinto River to the Gulf of Mexico).

BRUSHY CREEK.—Jackson County; rises in the northwestern part of county; flows southeasterly 13 miles into Sandy Creek, and thus to Navidad and Lavaca Rivers, thence to Matagorda Bay and Gulf of Mexico near Ganado.

BRUSHY CREEK.—Karnes County; in northern part of county; small tributary to Elm Fork of Sandies Creek (thence to Sandies Creek and Guadalupe River).

BRUSHY OR BUCK CREEK.—Leon County; rises 2½ miles southwest of Robbins; flows southwesterly 15 miles into Navasota River (which discharges into the Brazos) near the International & Great Northern Railroad crossing.

BRUSHY CREEK.—Lamar and Red River counties; rises in southeastern part of Lamar County; flows southeasterly 7 miles into Little Sandy Creek (tributary to Sulphur River and thus through Red River to the Mississippi) at the county line about 2 miles north of the southeastern corner of Lamar County.

BRUSHY CREEK.—Marion County; rises near the county line in southwestern part of county; flows northeasterly 4½ miles into Big Cypress Bayou (tributary to Caddo Lake, which discharges into Mississippi River through Red River).

BRUSHY CREEK.—Milam and Williamson counties; rises 2 miles southwest of Buttercup in southwestern part of Williamson County; flows northeasterly 60 miles into San Gabriel River (tributary through Little River to the Brazos) about 3 miles above mouth of San Gabriel River and 13 miles northeast of Thorndale. Taylor, Bastrop, Georgetown, and Austin topographic maps.

BRUSHY CREEK.—Madison County; small stream flowing into Caney Creek (tributary to Trinity River) northwest of the town of Madisonville in the northwestern part of the county.

BRUSHY CREEK.—Montague County; small stream flowing through southern part of county into Denton Creek (tributary to Elm Fork of the Trinity and thus to Trinity River). Montague topographic map.

BRUSHY CREEK.—Robertson County; small tributary to Big Cedar Creek (tributary to Navasota River and thus to the Brazos) northeast of Wheelock in southeastern part of county; length, 6 miles.

BRUSHY CREEK.—Stephens County; rises 3 miles northwest of Eolian in western part of county; flows northeasterly 6 miles into Sandy Creek (tributary to Gonzales Creek through Hubbard Creek and thus to Clear Fork of Brazos River and the Brazos). Albany and Breckenridge topographic maps.

BRUSHY CREEK.—Uvalde County; small intermittent stream in northern part of county; flows southerly 5 miles into Frio River (tributary to the Nueces) at Florea Ranch. Uvalde topographic map.

BRUSHY CREEK.—Washington and Austin counties; rises in southwestern part of Washington County; flows southerly 5 miles into West Fork of Mill Creek (tributary through Mill Creek to Brazos River) in northwestern part of Austin County.

BRUSHY CREEK.—Young and Jack counties; rises in the northeastern part of Young County; flows northeasterly 7 miles into School Creek (tributary to West Fork of Trinity River and thus to the Trinity) in the northwestern corner of Jack County.

BRUTON CREEK.—Red River County; rises about 2 miles northwest of Bagwell in western part of county; flows southerly 10 miles into Guest Creek (tributary through Cuthand Creek to Sulphur River and thus to the Mississippi through Red River).

BRUTONS CREEK.—Morris County; rises about 2 miles north of Daingerfield in central part of county; flows southerly 12 miles into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) near the corner of Morris, Camp, and Upshur counties. Daingerfield topographic map.

BUCK BRANCH.—Erath County; headwater stream flowing southeasterly 4 miles to its junction with Green Creek (tributary to Bosque River and thus to the Brazos) north of the town of Dublin. Stephenville topographic map.

BUCK BRANCH.—Gonzales County; an intermittent stream flowing southerly 8 miles to its junction with Sandy Fork of Peach Creek (tributary to Peach Creek and thus to the Guadalupe) 2½ miles south of Thomsonville. Flatonia topographic map.

BUCK BRANCH.—Montague County; small intermittent stream flowing into Elm Fork of Trinity River (which discharges into the Trinity) south of Saint Jo. Montague topographic map.

BUCK CREEK.—Angelina County; rises about 4 miles northeast of Homer; flows southerly 18 miles into Neches River 7 miles southwest of Manning.

BUCK CREEK.—Cooke County; small intermittent stream flowing into Timber Creek (tributary through Jordan and Isle du Bois Creeks to Elm Fork of Trinity River and thus to the Trinity) about 3 miles northwest of Woodbine. Gainesville and Denison topographic maps.

BUCK CREEK.—Lavaca County; rises 6 miles north of Hallettsville; flows southerly 5 miles into Lavaca River (thus to Gulf of Mexico through Matagorda Bay) near Hallettsville.

BUCK CREEK.—Newton County; flows easterly 9 miles into Sabine River in the northeastern corner of the county.

BUCK CREEK.—Palo Pinto and Erath counties; joins Palo Pinto Creek (tributary to Brazos River) 1½ miles southwest of Brazos in southeastern part of Palo Pinto County; length, 14 miles. Stephenville and Palo Pinto topographic maps.

BUCK CREEK.—Sabine County; small stream flowing into Magnolia Creek (tributary to Richland and Sixmile creeks, thence to Sabine River) in southeastern part of county.

BUCK CREEK.—Somerville County; rises near Johnson-Somerville county line; flows southerly 4½ miles into Brazos River in the southeast corner of the county; intermittent. Granbury topographic map.

BUCK CREEK.—Taylor and Callahan counties; rises 6 miles southeast of Elmdale; flows northwesterly 12 miles into Lytle Creek (tributary to Elm Creek and thus through Clear Fork of Brazos River to the Brazos) near Jones-Taylor county line; partially intermittent. Anson and Abilene topographic maps.

BUCK CREEK.—Titus County; rises in northeastern part; flows northerly 4 miles into Horse Creek (tributary to Whiteoak Bayou, thence through Sulphur and Red rivers to the Mississippi).

BUCKET CREEK.—Karnes County; small stream flowing through the southern part of the county into Escondido Creek and thus to San Antonio River (tributary to the Guadalupe).

BUCKEYE CREEK.—Shelby County; small stream flowing into Patroon Bayou (tributary to Sabine River) south of Patroon in southeastern part of county.

BUCKHAM CREEK.—Lamar County; rises about 3 miles southeast of Petty in southwestern part of county; flows southeasterly 6 miles into North Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi) at the southern boundary of the county.

BUCKLEYS CREEK.—North Prong; Val Verde County; small stream in northeastern corner of county; flows into Buckleys Creek and thus to Devils River (tributary to Rio Grande).

BUCKLEYS CREEK.—Sutton and Val Verde counties; rises in extreme northeastern corner of Val Verde County near the Sutton-Val Verde County line; flows southwestward 18 miles to its junction with Devils River (tributary to Rio Grande) 7 miles northeast of Juno; intermittent.

BUCKNERS CREEK.—Bastrop and Fayette counties; rises in southeastern part of Bastrop County; flows easterly 2 miles through Bastrop County then 22 miles through Fayette County into Colorado River at La Grange. Flatonia topographic map.

BUENA CREEK.—Terrell County; rises in southwestern part; flows southeasterly into Rio Grande; intermittent. Dryden Crossing topographic map.

BUFORD BRANCH.—King County; rises in northwestern part; flows northeasterly 11 miles into North Wichita River (tributary to Wichita River, and thus through Red River to the Mississippi) near Cottle-King county line.

BUFORD CREEK.—Dickens County; rises in northeastern part of county; a small headwater stream of North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi; in parts of King and Cottle counties North Wichita River is caller Buford Creek.

Buffalo Bayou.—Fort Bend and Harris counties; rises in extreme northern part of Fort Bend County; flows easterly 8 miles through Fort Bend County, then 38 miles through Harris County into San Jancinto Bay (and thus to Trinity and Galveston Bay, thence to Gulf of Mexico) at Lynchburg; tidal from the city of Houston at its junction with White Oak Bayou, a distance of 18 miles; has been widened and deepened for commercial purposes as far as Houston. From a point 5 miles below Houston, known as "Turning Basin," to the mouth, it is known locally as "Ship Channel."

Buffalo Creek.—Blanco County; north of Johnson City in the central part of the county; a small intermittent stream flowing into Pedernales River, and thus to the Colorado; length, 4 miles. Blanco topographic map.

Buffalo Creek.—Brazoria County; rises northeast of the town of Brazoria in southern part of the county; flows southeasterly 7 miles into Brazos River.

Buffalo Creek.—Freestone and Limestone counties; rises southeast of Mexia; flows southerly 20 miles into Navasota River (tributary to Brazos River) near Limestone-Leon county line.

Buffalo Creek.—Freestone and Leon counties, rises in the southwestern part of Freestone County; flows southeasterly 30 miles into Upper Keechi Creek (tributary to Trinity River) in northeastern part of Leon County.

Buffalo Creek.—Hardeman and Wilbarger counties; rises about 6 miles southwest of Quanah in southern part of Hardeman County; flows eastward 34 miles into Pease River (tributary to Red River and thus to the Mississippi) 3½ miles northwest of Vernon in northern part of Wilbarger County.

Buffalo Creek.—Johnson County; formed one mile south of Cleburne by union of East and West Buffalo creeks; flows southerly 5 miles into Nolands River (tributary to the Brazos) 3 miles northwest of Rio Vista in central part of county. Cleburne topographic map.

Buffalo Creek.—Lipscomb County; an intermittent stream flowing northerly 6 miles into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 11 miles west of Lipscomb in western part of county.

Buffalo Creek.—Mills County; rises south of Hydesport; flows through the southwestern part of the county into the Colorado; length, 7 miles. Brownwood and San Saba topographic maps.

Buffalo Creek, North Prong of.—Freestone and Leon counties; rises about 6 miles south of Fairfield in Freestone County; flows southeasterly 13 miles into Buffalo Creek (tributary to Upper Keechi Creek, thence to Trinity River) near the county line in northern part of Leon County.

Buffalo Creek.—Rockwall and Kaufman counties; rises in the southwestern part of Rockwall County; flows southerly 14 miles into East Fork of Trinity River (tributary to the Trinity) in western part of Kaufman County. Barnes Bridge topographic map.

Buffalo Creek.—San Saba County; rises 10 miles south of San Saba in the southeastern part of the county; flows 7 miles into Cherokee Creek and thus to Colorado River. San Saba topographic map.

Buffalo Creek.—Tarrant County; rises in northern part of county; flows into Elizabeth Creek (tributary through Denton Creek to Elm Fork of Trinity River and thus to the Trinity). Fort Worth topographic map.

BUFFALO CREEK.—Wichita County; formed 4 miles northwest of Iowa Park by union of North and South forks of Buffalo Creek; flows southeasterly 8½ miles into Wichita River (tributary to Red River and thus to the Mississippi); partially intermittent. Iowa Park and West Wichita Falls topographic maps.

BUFFALO CREEK, NORTH FORK.—Wichita County; rises about 3 miles east of Electra; flows southeasterly 10 miles into Buffalo Creek (tributary to Wichita River, thence to Red River and thus to the Mississippi); intermittent. Barwise School, Fowlkes, and Iowa Park topographic maps.

BUFFALO CREEK, SOUTH FORK.—Wichita County; rises one-half mile south of Electra; flows southeasterly about 10 miles into Buffalo Creek (tributary to Wichita River and thus to Red and Mississippi rivers; intermittent. Electra, Barwise School, and Iowa Park topographic maps.

BUFFALO DRAW.—Sutton County; a stream 9 miles long flowing through the central part of the county into North Llano River (tributary through the Llano to Colorado River). Fort McKavett topographic map.

BUFFALO HEAD CREEK.—Wichita County; rises about one-half mile southwest of Beaver Day; flows southeasterly 18 miles into Wichita River (tributary through Red River to the Mississippi) 8 miles west of Wichita Falls.

BUFFORD CREEK.—Stephens County; rises 4 miles northeast of Breckenridge; flows northward 8 miles into Clear Fork of Brazos River (tributary to the Brazos) in northern part of county. Breckenridge topographic map.

BUKE CREEK.—Kent County; rises at Buke Knob 2 miles southeast of Clairemont; flows easterly 7 miles into Salt Fork of Brazos River (tributary to the Brazos).

BULL CREEK.—Collingsworth County; rises in northwestern part of county; flows southeasterly 5 miles into Willis Creek (tributary to Salt Fork of Red River, and thus through Prairie Dog Town Fork of the Red to Red River thence to the Mississippi).

BULL CREEK.—Polk County; rises in northwestern part of county; flows northeasterly along county line about 4 miles to a point near Caramona where it enters Piney Creek (tributary to Neches River).

BULL CREEK.—Polk County; a stream flowing into Long Tom Creek (tributary to Long King Creek, then to Trinity River) in the northwestern part of county.

BULL CREEK.—Travis County; rises west of Jollyville in the north central part of the county; flows southward 8 miles into Colorado River 4 miles above Austin Dam. Austin topographic map.

BULLHEAD CREEK.—Llano County; rises 4 miles southeast of Starkes in the southwestern part of the county; flows northward 10 miles into Hickory Creek (tributary to Llano River and thus to the Colorado) 7 miles east of Castell. Llano topographic map.

BULL CREEK.—Coleman County; rises north of Waldrip in the southeastern part of the county; flows 13 miles into Colorado River. Coleman and Brady topographic maps.

BULLHEAD CREEK.—Edwards County; a small intermittent tributary to East Nueces River and thus to Nueces River in the eastern part of the county; length, 10 miles. Nueces topographic map.

BULLHEAD CREEK.—Bee County; small stream flowing into Papalote Creek (tributary to Aransas River, Copano Bay, and Gulf of Mexico) in southern part of county; flows southeasterly 10 miles.

BULL HIDE CREEK.—McLennan County; rises 3 miles southwest of Hewitt; flows southeasterly 18 miles into Brazos River near Falls-McLennan county line in southern part of county. Temple topographic map.

BULL HOLLOW.—Schleicher County; a small intermittent stream in the southeastern part of the county; flows 7 miles into Middle Valley and thus to the San Saba (tributary to Colorado River). Fort McKavett topographic map.

BULL CREEK.—Mills County; southeast of Big Valley in the southern part of county; small tributary to Colorado River; length, 8 miles. San Saba topographic map.

BULL HOLLOW.—Sutton County; a small stream in the southern part of county; empties into North Llano River (tributary through the Llano to Colorado River); length, 11 miles. Rock Springs topographic map.

BULLARD CREEK.—Fannin County; rises about 3 miles east of Dodd City in central part of county; flows northerly 5½ miles into Bois d'arc Creek (tributary to Red River, which discharges into the Mississippi).

BULLARD CREEK.—Hall County; a stream 5 miles long rising near central part of county and flowing northeasterly into Prairie Dog Town Fork of Red River (tributary of Red River and thus to the Mississippi).

BULL RUN CREEK.—Armstrong County; rises in southern part; flows southwesterly 8 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) at the southern boundary of the county.

BURGESS CREEK.—Parker County; a small stream flowing into South Fork of Trinity River (tributary through Clear Fork of Trinity River to West Fork of Trinity River and thus to the Trinity) west of the town of Anneta. Weatherford topographic map.

BURKE CREEK.—Hopkins and Wood counties; rises in southern part of Hopkins County; flows southerly 13 miles into Lake Fork of Sabine River (tributary to the Sabine) in northwestern part of Wood County.

BURLESON CREEK.—Lampasas County; rises in southern part of county; flows southeastward 5 miles into Sulphur Creek (tributary to Lampasas River and thus through Little River to the Brazos) at Lampasas. Lampasas topographic map.

BURNT OAK CREEK.—Concho County; southeast of Vigo in the southwestern part of the county; flows 6 miles through Kickapoo Creek into Concho River (tributary to Red River and thus to the Mississippi).

BURZALINAS CREEK.—Aransas County; rises in northern part of county; flows southwestward 4 miles into St. Charles Bay and thus to Aransas Bay and Gulf of Mexico.

BURROS CANYON.—Presidio County; small stream flowing southwesterly 4 miles into Rio Grande 1 mile southeast of Santiago in southern part of county; intermittent. Polvo topographic map:

BURRO CREEK.—Dimmitt County; small tributary to San Roque Creek (thence to Nueces River) in southeastern part of county; flows northward and westward; length, 14 miles.

BURRETT CREEK.—Wise County; small stream joining West Fork of Trinity River (tributary to the Trinity) near Newark in southeastern part of county.

BUSBY BRANCH.—Fayette County; rises north of Muldoon in the western part of county; an intermittent tributary to Colorado River through Buckner Creek; length, 4 miles. Flatonia topographic map.

BUSHY CREEK.—Ellis County; rises in northern part 6 miles southwest of Ferris; flows southeasterly into Trinity River. Dallas topographic map.

BUSH KNOB CREEK.—Throckmorton County; a stream flowing northeasterly 9 miles into Elm Creek (tributary to the Brazos) northeast of Masters in eastern part of county.

BUTLER CREEK.—Cass County; rises about one-half mile north of Anti school; flows southwesterly 6 miles into Black Bayou (tributary to Caddo Lake, thence through Red River to the Mississippi) about 3 miles northwest of Atlanta in northern part of county.

BUTTERNUT CREEK.—Runnels County; a small stream east of Ballinger in the southeastern part of the county; flows 7 miles to its junction with Mustang Creek (tributary to Colorado River.) Ballinger topographic map.

BUZZARDWING CREEK.—Montague County: small intermittent stream flowing about 3 miles west of Battle-ax School into Belknap Creek (tributary to Red River and thus to the Mississippi) in norhwestern part of county. Montague topographic map.

BYERS LAKE.—Bowie County; about 5½ miles west of Index in northeastern part of county; outlet, Red River (tributary to the Mississippi); formerly a channel of Red River; small.

CABEZA CREEK.—Dewitt, Karnes, and Goliad counties; rises in the southwestern part of Dewitt County; flows southeasterly 9 miles through Dewitt County, 7 miles through Karnes County, then 13 miles through Goliad County to a point 6 miles west of Goliad, where it empties into San Antonio River (tributary to the Guadalupe).

CACTUS BRANCH.—Falls County; rises southwest of Lott; flows southerly 5 miles into Pond Creek (tributary to Brazos River) in southern part of county. Temple topographic map.

CADENA CREEK.—Goliad County; small stream south of the town of Goliad in the central part of county; flows into San Antonio River and thus to the Guadalupe.

CADDO CREEK.—Franklin County; small stream rising in southwestern part of county and flowing into Big Cypress Creek, thence to Caddo Lake and thus through Red River to the Mississippi.

CADDO CREEK.—Henderson and Anderson counties; rises in the southeastern part of Henderson County; flows southeasterly 14 miles into Neches River near Reese.

CADDO CREEK.—Harrison County; rises in southeastern part; flows southwesterly 7 miles into Caney Creek (tributary to the Sabine) at the Harrison-Panola County line.

CADDO CREEK.—Young County; a small intermittent stream in southeast corner of county flowing southerly 3½ miles into Brazos River.

CADDO FORK OF SABINE RIVER.—Hunt County; rises about 4 miles west of the town of Celeste; flows southeasterly 36 miles to its confluence with south Fork of Sabine River (thence to Sabine River) in the southeastern corner of the county.

CADDO LAKE.—Marion and Harrison counties, Tex., and Caddo Parish, La.; one of a series of lakes adjacent to Red River in the vicinity of Shreveport, La.; an expansion of Big Cypress and Little Cypress creeks; heads about 4 miles east of Jefferson in southern part of Marion County, Tex.; enters Red River (tributary to the Mississippi) through Lake Soda at Shreveport, La.; length from head to Louisiana boundary, 24 miles; entire length from source to its junction with Lake Soda 15 miles northwest of Shreveport, approximately 32 miles; average width about 3 miles; total area, 110 square miles; called "Ferry Lake" at upper end.

CALAHAN CREEK.—Caldwell County; small intermittent stream north of Fentress in the southern part of the county; empties into Crooked Branch (tributary to San Marcos River and thus to the Guadalupe). San Marcos topographic map.

Calamity Creek.—Brewster County; heads 5 miles south of Alpine; takes southerly course 30 miles to its confluence with Goat Creek (tributary to Maravilla Creek and thus to Rio Grande). Alpine topographic map.

Calaveras Creek.—Wilson and Bexar counties; rises 1 mile south of Martinez in the eastern part of Bexar County; flows southerly 10 miles through Bexar County, then 5 miles through Wilson County into San Antonio River (tributary to the Guadalupe) near Calaveras. San Antonio topographic map.

Calf Creek.—Donley County; rises in central part of county; flows southwesterly 3 miles into Saddlers Creek (tributary to Salt Fork of Red River, thence to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

Calf Creek.—Grayson County; rises about 2 miles northeast of Sherman; flows southeasterly 5 miles into Choctaw Creek (tributary to Red River and thus to the Mississippi). Denison topographic map.

California Creek.—Val Verde County; rises about 4 miles east of Feely; flows southerly 7 miles into Evans Creek (tributary to Devils River and thus to Rio Grande); intermittent.

California or South Paint Creek.—Throckmorton, Haskell, Jones, and Fisher Counties; rises 10 miles northeast of Roby in northeastern part of Fisher County; flows northeastward 70 miles into Clear Fork of Brazos River (tributary to Brazos River) in southwestern part of Throckmorton County. Roby and Anson topographic maps.

Callett Creek.—Wise County; joins Denton Creek (which discharges into Trinity River through the Elm Fork of the Trinity) south of Slidell in eastern part of county.

Camp Branch.—Bowie County; rises about 2 miles northwest of Bassett; empties into Bassett Creek (tributary to Sulphur River and thus through Red River to the Mississippi) in southwestern part of county.

Camp Creek.—Anderson County; rises 1 mile east of Douglas; flows southwesterly 4 miles into Trinity River at Magnolia.

Camp Creek.—Austin and Washington Counties; rises in southwestern part of Washington County; flows southerly 7 miles into West Fork of Mill Creek (tributary to Mill Creek and thus to Brazos River) near Industry in northwestern part of Austin County.

Camp Creek.—Bell County; rises near Oenaville in eastern part of county; flows southeasterly 16 miles into Big Elm Creek (tributary through Little River to the Brazos). Temple and Taylor topographic maps.

Camp Creek.—Cass County; a small intermittent stream flowing into Sulphur River (tributary to Red River, which discharges into the Mississippi) about one-half mile southeast of Spencer Spur in northeastern part of county. Atlanta topographic map.

Camp Creek.—Coleman County; southwest of Trickham in the southeastern part of the county; flows 14 miles to its junction with Home Creek (tributary to the Colorado). Coleman and Brady topographic maps.

Camp Creek.—Cooke County; rises about 5 miles south of Bulcher in northwestern part of county; flows northerly 7 miles into Red River (tributary to the Mississippi) a mile north of Bulcher. Gainesville topographic map.

Camp Creek.—Donley County; a stream 4 miles long flowing southerly through eastern part of county into McCormick Creek (tributary to Salt Fork of Red River, and thus through Prairie Dog Town Fork of Red River to the Red and Mississippi rivers).

CAMP CREEK.—Johnson County; rises 3½ miles south of Bono in southwestern part of county; flows southwesterly 8 miles into Brazos River. Granbury topographic map.

CAMP CREEK.—Kent County; rises 2 miles northeast of Clairemont in central part of county; flows easterly 5 miles into Salt Fork of Brazos River (which discharges into the Brazos).

CAMP CREEK.—Kent and Dickens Counties; a stream 8 miles long flowing eastward along the Kent-Dickens county line into Duck Creek, and thus through Salt Fork of Brazos River to the Brazos.

CAMP CREEK.—Lee County; small intermittent stream flowing southerly 4 miles into Watleye Creek (tributary through Cross Creek to Second Yegua Creek and thus through Yegua Creek to Brazos River) in northwestern part of county. Bastrop topographic map.

CAMP CREEK.—Lipscomb County; an intermittent stream rising 5 miles northwest of Higgins and flowing northerly 10 miles into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 10 miles east of Lipscomb in eastern part of county.

CAMP CREEK.—Lynn County; a stream 3 miles in length rising in southeastern part of county and flowing southerly into Double Mountain Fork of Brazos River (which discharges into Brazos River) near Lynn-Garza county line.

CAMP CREEK.—Mason and McCulloch Counties; a stream flowing through the southern part of McCulloch County and northern part of Mason County into San Saba River and thus to the Colorado; length, 11 miles. Brady and Mason topographic maps.

CAMP CREEK.—Robertson County; rises near southeastern boundary of county; flows easterly 6 miles into Navasota River (tributary to Brazos River) east of Franklin.

CAMP CREEK.—San Saba County; north of San Saba in the eastern part of county; 9 miles in length flowing into San Saba River and thus to the Colorado. San Saba topographic map.

CAMP CREEK.—Young County; a westward flowing stream 8 miles long joining Brazos River close to Young-Throckmorton county line near Spring Creek.

CAMP LAKE SLOUGH.—Uvalde and Zavalla Counties; intermittent; rises 4 miles south of Uvalde; flows southeasterly 6½ miles through Uvalde County, then 9 miles through Zavalla County into Leon River (tributary to Frio and Nueces Rivers). Uvalde topographic map.

CAMPBELL CREEK.—Armstrong and Briscoe Counties; rises in southern part of Armstrong County; flows southeasterly 5½ miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) in northern part of Briscoe County.

CAMPBELL CREEK.—Caldwell County; near McMalan; empties into Tenney Creek and thus through Plum Creek and San Marcos River to the Guadalupe. San Marcos and Flatonia topographic maps.

CAMPBELL CREEK.—Guadalupe County; small intermittent stream flowing into Cottonwood Creek (thence to Guadalupe River) south of Seguin. San Marcos topographic map.

CAMPBELL CREEK.—Franklin County; rises in northeastern part of county; flows northerly 4 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

CAMPBELLS CREEK.—Lavaca County; a stream 2 miles long flowing southwesterly into Buck Creek (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico) 2 miles northwest of Hallettsville.

CAMPBELLS CREEK.—Robertson County; rises in southwest corner of county; flows southwestward 7 miles into Little Brazos River (tributary to Brazos River) 3 miles west of Benchley.

CAMPBELL BRANCH.—Montague County; small intermittent stream flowing into Red River (tributary to the Mississippi) in northeastern part of county. Montague topographic map.

CAMPBELL DRAW.—Menard County; an intermittent tributary joining San Saba River, tributary to the Colorado) in the western part of the county; 3½ miles east of Fort McKavett; length, 9 miles. Fort McKavett topographic map.

CAMPGROUND CREEK.—Llano County; an intermittent stream 2 miles southwest of the town of Bluffton; flows through eastern part of the county into Colorado River; length, 5 miles. Burnet topographic map.

CAMP WOOD CREEK.—Edwards County; a small intermittent tributary to East Nueces River (thence to Nueces River) in the southeastern part of the county at Camp Wood; length, 4 miles. Nueces topographic map.

CANADA DE PADILLA CREEK.—Atascosa County; rises on the boundary of Atascosa and Frio counties; flows southeastward 8 miles into Atascosa River (tributary to Nueces River through the Frio).

CANDLER BRANCH.—Brown County; rises 2 miles east of Ricker in southeastern part of county; flows westerly 3 miles into Steppe Creek (tributary to Pecan Bayou and thus to Colorado River); intermittent. Brownwood topographic map.

CANDILLA CREEK.—Brewster and Terrell counties; rises in eastern part of Brewster County near Brewster-Terrell county line; flows southeasterly 3½ miles, crossing Brewster-Terrell county line into Washboard Canyon (tributary to San Francisco Creek and thus to Rio Grande); intermittent. Indian Wells topographic map.

CANE CREEK.—Hunt County; tributary to Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of the Sabine) in eastern part of the county.

CANE CREEK.—Lamar County; rises about 3 miles west of Brookston in southwestern part of county; flows southeasterly 11 miles into North Sulphur River, (tributary to Sulphur River, thence through Red River to the Mississippi) in the southwestern part of the county at the southern boundary.

CANE CREEK.—Kaufman and Henderson counties; rises in southwestern part of Kaufman County; flows southerly 9 miles into Trinity River, about 2 miles northwest of Buffalo in Henderson County.

CANEY BAYOU.—Houston County; rises about 4 miles southwest of Crockett; flows southwesterly into Trinity River south of Vistula; length, 18 miles.

CANEY BAYOU.—Shelby County; small stream; flows into Attoyac Bayou (tributary through Angelina River to the Neches) in northwestern part of county.

CANEY BAYOU.—Wharton and Matagorda counties; rises near Wharton in Wharton County; flows southeasterly 65 miles into the east end of Matagorda Bay, thence through another channel into Gulf of Mexico.

CANEY BRANCH.—Matagorda County; rises in the east central part of the county; flows southeasterly 6 miles into Caney Bayou, and thus to Matagorda Bay and Gulf of Mexico.

CANEY CREEK.—Bowie County; rises about 1½ miles south of Whaleys; flows southeasterly 9 miles into Langum Creek (tributary to Sulphur River and thus to the Mississippi through Red River) 1 mile south of Clem in southern part of county. New Boston topographic map.

CANEY OR WHATLEY CREEK.—Cass County; rises about 2 miles west of Munz, in northern part of county; flows northeasterly 9½ miles into Sulphur River (tributary through Red River to the Mississippi), about 5 miles northeast of Bryans Mill. Linden and New Boston topographic maps.

CANEY CREEK.—Cass County; rises 4 miles northwest of Putman; flows westerly 3 miles into Kelley Creek (tributary to Black Cypress Bayou, thence through Big Cypress Bayou to Caddo Lake, and thus through Red River to the Mississippi). Daingerfield topographic map.

CANEY CREEK.—Fannin County; rises about 4 miles south of Savoy, in western part of county; flows northeasterly 18 miles into Red River (tributary to Mississippi River) northwest of Ravenna.

CANEY CREEK.—Grimes and Montgomery counties; rises in the eastern part of Grimes County; flows northeasterly 3 miles through Grimes County, then 9 miles through Montgomery County into Lake Creek (tributary to West San Jacinto River, San Jacinto River, and Gulf of Mexico).

CANEY CREEK.—Harrison and Panola Counties; rises in southeastern part of Harrison County; flows southwesterly about 12 miles into Sabine River, in the northwestern part of Panola County.

CANEY CREEK.—Henderson County; rises about 5 miles northeast of Athens; flows westerly and southwesterly 19 miles into Cedar Creek (tributary to Trinity River).

CANEY CREEK.—Hopkins County; a small stream in the eastern part of county flowing northerly 8 miles into Whiteoak Bayou (tributary to Sulphur River and thus to the Mississippi through Red River).

CANEY CREEK.—Hopkins and Wood Counties; rises about 9½ miles southeast of Sulphur Springs in the southern part of Hopkins County; flows southwesterly 18 miles into Lake Fork of Sabine River (tributary to the Sabine) about 5 miles west of Quitman, in Wood County.

CANEY CREEK.—Leon County; rises near Concord; flows southwestward 12 miles into Navasota River (tributary to the Brazos).

CANEY CREEK.—Madison County; rises in the northwestern part of the county; flows southeasterly 22 miles into Bidais Creek (tributary to Trinity River) 8 miles southeast of Madisonville.

CANEY CREEK.—Madison County; rises near Madison-Leon county line; flows southwesterly 8 miles into Navasota River (tributary to the Brazos) west of George.

CANEY CREEK.—Montgomery County; rises in the northwest corner of the county; flows southeasterly 17 miles into West San Jacinto River, thence to San Jacinto River, Galveston Bay, and Gulf of Mexico.

CANEY CREEK.—Nacogdoches County; rises in eastern part; flows easterly 8 miles into Attoyac Bayou and thus through Angelina River to the Neches.

CANEY CREEK.—Newton County; rises about 7 miles north of Newton; flows southeasterly 19 miles into Sabine River.

CANEY CREEK.—Panola County; a small tributary to Murvalls Bayou (thence to Sabine River) in southwestern part of county.

CANEY CREEK.—Polk and Tyler counties; rises about 3 miles southwest of Barnum, in Polk County; flows northeasterly into Neches River in the extreme northwestern corner of Tyler County.

CANEY CREEK.—Rains County; tributary to Sabine River in northwestern part of county.

CANEY CREEK.—Red River County; rises about 4 miles southwest of Avery; flows southerly 12 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) in southeastern part of county.

CANEY CREEK, EAST FORK OF.—Red River County; small stream rising south of Avery, in southeastern part of county, and flowing to Caney Creek, thence to Sulphur River and thus through Red River to the Mississippi.

CANEY CREEK.—Red River County; a small stream 7 miles north of Annona, flowing into Pecan Bayou (tributary to Red River and thus to the Mississippi) in the northeastern part of county.

CANEY CREEK.—San Augustine County; small stream discharging into Ayish Bayou (tributary to Angelina River and thus to the Neches) south of San Augustine in northern part of county.

CANEY CREEK.—San Augustine County, eastern part; small stream flowing into Chiamon Bayou (tributary to Ayish Bayou, thence to Angelina and Neches rivers) in eastern part of the county.

CANEY CREEK.—Trinity County; rises about 3 miles west of Groveton; flows southwesterly 11 miles into White Rock Creek (tributary to Trinity River) about a mile above its mouth.

CANEY CREEK.—Upshur County; rises 3 miles southwest of Lafayette in northern part of county; flows southerly 7 miles into Little Cypress Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) about 3 miles northeast of Gilmer.

CANEY CREEK.—Wood and Upshur counties; rises in northeastern part of Wood County; flows southeasterly 13 miles into Little Cypress Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) in northwestern part of Upshur County.

CANEY CREEK.—Walker and Montgomery counties; rises in southeastern part of Walker County; flows southeasterly 3 miles through Walker County, then 33 miles through Montgomery County into Peach Creek (tributary to East San Jacinto River, Galveston Bay, and Gulf of Mexico) near southeastern county line.

CANEY CREEK.—Washington and Austin counties; rises in southern part of Washington County; flows easterly 13 miles along Washington-Austin county line into Brazos River, southwest of Hempstead.

CANNAI CREEK.—Foard County; small stream in northern part of county flowing into Pease River (which discharges into the Mississippi through Red River).

CANNON GULLY.—Harris County; rises in northwestern part of county 2½ miles northwest of Willow Siding; flows southeasterly 2 miles into Willow Creek; intermittent. Louetta topographic map.

CANOE BAYOU.—Matagorda County; rises in the southeastern part of the county; flows southeasterly 10 miles into Live Oak Creek, and thence to Matagorda Bay and Gulf of Mexico.

CANON CREEK.—Bandera and Real counties; a small intermittent stream rising in southeastern part of Real County and flowing southeasterly 12 miles to its junction with Sabinal River (thence to the Nueces through Frio River) near Utopia.

CANTAU CREEK.—Guadalupe County; small stream flowing into Guadalupe River about 5 miles southeast of Seguin. San Marcos topographic map.

CANYON CREEK.—Bandera and Real counties; rises near Bandera-Real county line; flows southeasterly 12 miles into Sabinal River (tributary to Frio River and thus to the Nueces) near Bandera-Uvalde county line.

CANYON CREEK.—Clay and Montague counties; rises 4 miles northeast of Bellevue in eastern part of Clay County: flows easterly 4 miles into Belknap Creek (tributary to Red River and thus to the Mississippi) in northwestern part of Montague County. Montague topographic map.

CANYON CREEK.—Lipscomb County; a stream flowing northerly 7 miles into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 7 miles east of Lipscomb in eastern part of county; intermittent.

CANADIAN RIVER.—Hemphill, Roberts, Hutchinson, Moore, Potter, and Oldham counties; one of the large tributaries of Arkansas River; rises in Raton Pass, Colfax County, northeastern New Mexico; flows southeasterly to a point near the center of western line of Oldham County, where it enters the State of Texas; continuing this southeasterly course it crosses the Panhandle of Texas, passes into Oklahoma from Hemphill County, Texas, and joins Arkansas River (tributary to the Mississippi) 20 miles east of Canadian in eastern part of Oklahoma; total length, 760 miles, of which 190 miles are in Texas.

The stream flows through a wide and sandy channel which is subject to large seepage losses. During dry seasons it is without flow, but at times it is subject to destructive floods.

Irrigation is not practiced to any great extent by diversions from the river and there are no water-power developments in Texas. Area of drainage basin in Texas, 9,740 square miles, principal tributaries in Texas, Wolf Creek, Big Blue Creek, and Red Deer Creek.

CAPADERO CREEK.—Victoria County; southwest of Victoria in the western part of the county; flows into Coleto Creek (tributary to the Guadalupe).

CAPOTE CREEK.—Presidio County; rises on western side of Capote Peak, 12 miles northeast of Upper San Antonio, Mexico; flows southwesterly 15 miles into Rio Grande opposite Upper San Antonio, Mexico. San Carlos topographic map.

CAPOTE DRAW.—Presidio County; rises in Cleveland Brakes southwest of Marfa in northern part of county; flows northerly 32 miles into Chispa Creek (thence to Wildhorse Creek which sinks in sand) 11 miles northwest of Ryan; intermittent. San Carlos and Marfa topographic maps.

CARANCAHUA CREEK.—Jackson, Matagorda, and Calhoun counties; rises in the northwestern corner of Matagorda County; takes a very irregular course 11 miles through Matagorda County, 15 miles through Jackson County, then for 2 miles along the boundary between Jackson and Calhoun counties; thence through Carancahua Bay into Matagorda Bay and Gulf of Mexico.

CARACOL CREEK.—Bexar County; an intermittent stream in the northwestern part of the county; tributary through Medio Creek to Medina River, and thus through San Antonio River to the Guadalupe. San Antonio topographic map.

CARBAJAL CREEK.—Wilson and Karnes counties; small stream flowing through the eastern part of Wilson and western part of Karnes County into Rio Cibolo and thus to the San Antonio (tributary to Guadalupe River).

CARLOW CREEK.—Cass County; rises about 2 miles south of Douglasville in northern part of county; flows northwesterly 6 miles into Powell Creek (tributary through Sulphur River to the Red and thus to Mississippi River) about 2½ miles northwest of Douglasville. Linden topographic map.

CARNELIAN CREEK.—Montgomery County; rises in the north central part of the county; flows southerly 12 miles into West San Jacinto River (tributary to San Jacinto River and Galveston Bay, thence to Gulf of Mexico).

CAROLINA CREEK.—Walker County; joins Trinity River at Carolina in the northeastern part of the county.

CARPENTERS BAYOU.—Harris County; rises 5 miles northwest of Sheldon in the eastern part of the county; flows southeasterly 15 miles into Ship Channel (Buffalo Bayou) (thus to Galveston Bay and Gulf of Mexico) about 2 miles southwest of Lynchburg; tidal stream for 2 miles in lower course. Harmaston, Fauna and Burnet Bay topographic maps.

CARPERS CREEK.—Comal County; rises in northern part of county; flows into Blanco River and thus through the San Marcos to Guadalupe River.

CARRIZO CREEK.—Dallam and Hartley counties; an intermittent stream rising in eastern part of Colfax County, N. Mex., entering Texas at a point approximately 15 miles south of Texline in southern part of Dallam County, and flowing southeasterly 35 miles into Mustang Creek (tributary to Canadian River and thus through Arkansas River to the Mississippi) 4 miles northwest of Hartley.

CARROL CREEK.—Donley County; rises about 1 mile south of Jericho in northwestern part of county; flows southerly 11 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi) at Old Clarendon.

CARROLLS CREEK.—Jack County; rises about 6 miles south of Jacksboro in the south central part of the county; flows northeasterly 12 miles into West Fork of Trinity River (tributary to the Trinity) in the eastern part of the county, 8 miles northeast of Jacksboro.

CARREASE CREEK.—Live Oak County; rises in the southwestern part of the county, where it is known as Olmos Creek; flows easterly 20 miles into Nueces River near Cornelia post office.

CARRIZO CREEK.—Dimmit County; small stream; rises in northwestern part of county; flows northeastward to its junction with Nueces River; length, 24 miles.

CARTER LAKE.—Bowie County; about 4½ miles west of Index in northeastern part of county; an old channel of Red River (tributary to the Mississippi); very small.

CASAS BLANCAS CREEK.—Starr County; formed in western part of county by the union of Palitas Blancas Creek and Arroyo del Quenada; flows southerly 3½ miles into Rio Grande 3 miles southeast of Salineno.

CASA BLANCA CREEK.—Victoria County; rises in the eastern part of the county; flows eastward into Gariolas Creek, thence to Gulf of Mexico through Arenosa Creek, Lavaca and Matagorda bays.

CASCONADE CREEK.—Sterling and Coke counties; rises north of Bliss in the northeastern corner of Sterling County; flows easterly 9 miles into Colorado River in the northwestern corner of Coke County.

CASE CREEK.—Grayson County; joins Range Creek (tributary to Isle du Bois Creek, and thus to Trinity River through Elm Fork of the Trinity) about 1¼ miles east of the town of Ethel; small intermittent stream. Denison topographic map.

CASTILLITO CREEK.—Webb County; small tributary to Prieto Creek, thence to the Nueces in northeastern part of county.

CASTLEMAN CREEK.—McLennan County; rises near Hewitt in southern part of county; flows easterly 15 miles into Brazos River near Falls-McLennan County line. Temple topographic map.

CAT CREEK.—Lipscomb County; an intermittent stream 4 miles long joining Wolf Creek (tributary to North Fork of Canadian River and thus through Canadian and Arkansas rivers to the Mississippi 2½ miles east of Lipscomb in central part of county.

CAT CREEK.—Newton County; small tributary to Clear Creek (thence to Yellow Bayou, Little Cow Creek, and Sabine River) about 3 miles west of Burkeville.

CATFISH BAYOU.—Henderson and Anderson counties; rises about 8 miles southwest of Athens in Henderson County; flows southwesterly 30 miles into Trinity River in western part of Anderson County northwest of Palestine.

CATFISH CREEK.—Cottle and Foard counties; rises about 5½ miles east of Swearingen in northeastern part of Cottle County; flows northerly 6 miles along the county line into Pease River (tributary to Red River and thus to the Mississippi) near northwestern corner of Foard County.

CATFISH CREEK.—Hale, Lamb, Castro, and Parmer Counties; rises in Curry and Quay counties in eastern part of New Mexico, crosses Texas-New Mexico State line 6 miles north of Farwell; flows southeasterly 70 miles into White River (tributary through Salt Fork of Brazos River to the Brazos) in northern part of Hale County.

CAVE CREEK.—Coryell County; an intermittent stream flowing northeasterly 6 miles into Middle Bosque River (tributary through South Bosque and Bosque rivers to the Brazos) in northern part of county. Meridian topographic map.

CAVE CREEK.—Edwards County; a small intermittent tributary to West Nueces (tributary to Nueces River) in the southern part of county; rises at Goode; flows southwesterly 13 miles. Nueces topographic map.

CAVE CREEK.—Gillespie County; small stream in the western part of county flowing southeasterly 5 miles to its junction with Pedernales River (tributary to Colorado River) 1 mile west of Stonewall. Fredericksburg topographic map.

CAVASSO CREEK.—Refugio and Aransas counties; rises in the eastern part of Refugio County; flows 3 miles through Refugio County, then 4 miles through Aransas County into St. Charles Bay and thus to Aransas Bay and Gulf of Mexico.

CAYOTE OR SALT CREEK.—Culberson and Reeves counties; rises north of Plateau in southern part of Culberson County; flows easterly through Toyah Lake into Toyah Creek (and thus through Pecos River to Rio Grande) 7 miles south of Pecos in eastern part of Reeves County.

CEDAR ARROYA.—Terrell County; rises at Cedar Springs, 4 miles southwest of Lazier and south of Watkins in the southeastern part of county; flows southeasterly 8 miles to its junction with Rio Grande 10 miles south of Lazier.

CEDAR CREEK.—Liberty, Harris, and Chambers counties; rises in the western part of Liberty County; flows southerly for 15 miles along boundary line of Harris and Liberty counties, then 16 miles along boundary of Harris and Chambers counties into Trinity Bay, thence to Galveston Bay and Gulf of Mexico. Huffman, Crosby, Walley, Cedar Bayou, and Morgan Point topographic maps.

CEDAR BRANCH.—Dallas County; small stream flowing into Trinity River northwest of city of Dallas. Dallas topographic map.

CEDAR SPRING BRANCH.—Fayette County; west of Flatonia in southwestern part of county; flows into Big Fivemile Creek (tributary to Peach Creek and thus to Guadalupe River); intermittent. Flatonia topographic map.

CEDAR CREEK.—Angelina County; rises near Lufkin in the northwestern part of county; flows southerly 16 miles into Neches River.

CEDAR CREEK.—Bell County; rises near the southwestern corner of McLennan County; flows southwesterly 10 miles into Leon River (tributary through Little River to the Brazos) 3 miles south of Moffat. Temple topographic

CEDAR CREEK.—Caldwell and Bastrop counties; rises north of Mendoza in the northern part of Caldwell County; flows easterly 4 miles through Caldwell County, then 19 miles through Bastrop County to its junction with Walnut Creek (tributary to Colorado River) 3 miles west of Hills Prairie. Austin and Bastrop topographic maps.

CEDAR CREEK.—Dallas County; small stream flowing northeasterly from Hale into Trinity River south of the City of Dallas. Dallas topographic map.

CEDAR CREEK.—Edwards County; a spring-fed tributary to Pulliam Creek (thence to Nueces River) in the eastern part of the county; flows southeasterly 9 miles. Nueces topographic map.

CEDAR CREEK.—Edwards County; a small intermittent tributary in the southern part of the county; unites with West Nueces River (tributary to the Nueces) one-half mile above Black Water Hole; flows easterly 5 miles. Nueces topographic map.

CEDAR CREEK.—Fayette County; a small intermittent tributary through Buckner Creek to Colorado River in the central part of the county; length 2 miles. Flatonia topographic map.

CEDAR CREEK.—Fayette County; small intermittent stream 6 miles in length flowing into Colorado River 2 miles west of West Point in the northwestern part of the county. Flatonia topographic map.

CEDAR CREEK.—Fayette County; small tributary to Colorado River east of LaGrange in eastern part of county; length, 6 miles.

CEDAR CREEK.—Foard County; small stream rising in northern part of county and flowing into Cannal Creek (tributary to Pease River and thus through Red River to the Mississippi).

CEDAR CREEK.—Fort Bend and Brazoria counties; rises in southern part of Fort Bend County; flows southeasterly 8 miles to its junction with San Bernard River, thence to Gulf of Mexico in the western part of Brazoria County.

CEDAR CREEK.—Freestone County; a stream 11 miles long flowing northerly into Tehuacana Creek (tributary to the Trinity) in northeastern part of county.

CEDAR CREEK.—Grayson County; rises about 5 miles east of Howe in southeastern part of county; flows northwesterly 6 miles into Choctaw Creek (tributary to Red River and thus to the Mississippi) about 4 miles southeast of Sherman. Denison topographic map.

CEDAR CREEK.—Grimes County; flows southeasterly 8 miles into Caney Creek (thence to West San Jacinto River, San Jacinto River and Gulf of Mexico) in the southeastern part of the county.

CEDAR CREEK.—Grimes County; rises at Foster Farm in southwestern part of county northeast of the town of Navasota; flows southwesterly 4½ miles through Navasota into Navasota River (tributary to Brazos River). Navasota topographic map.

CEDAR CREEK.—Hemphill and Lipscomb counties; rises 11 miles north of Canadian near the line of Lipscomb and Hemphill Counties; flows in southerly direction joining Canadian River (tributary to Arkansas River and thus to the Mississippi) 3 miles east of Canadian in northern part of Hemphill County; length, 11 miles.

CEDAR CREEK.—Hill County; small stream in northwestern part of county; flows southerly into Brazos River 2 miles southeast of Fort Graham. Cleburne and Waco topographic maps.

CEDAR CREEK.—Hopkins County; small stream flowing into Garrett Creek (tributary through Lake Fork of Sabine River to the Sabine) in southwestern part of county.

CEDAR CREEK.—Hopkins and Franklin counties; rises in southeastern part of Hopkins County; flows southeastward 5 miles into Big Cypress Creek (tributary to Caddo Lake and thus to Red River and the Mississippi) in southwestern part of Franklin County.

CEDAR CREEK.—Hunt County; small stream flowing through south central part of county into Cowleach Fork of Sabine River and thus to the Sabine through Caddo Fork of Sabine River

CEDAR CREEK.—Hunt and Collin counties; rises near northwestern corner of Hunt County; flows southwesterly 14 miles into Pilot Grove Creek (tributary to Sister Grove Creek and thus through East Fork of the Trinity to Trinity River) about 4 miles west of Farmersville in Collin County.

CEDAR CREEK.—Johnson County; a stream flowing westward 3 miles into Brazos River at eastern extremity of DeCordova Bend in western part of county. Granbury topographic map.

CEDAR CREEK.—Knox County; small intermittent stream flowing easterly 2½ miles into Brazos River southeast of Benjamin.

CEDAR CREEK.—McCulloch County; rises in the northern part of county; flows 12 miles into Colorado River. Brady topographic map.

CEDAR CREEK.—Montague and Cooke counties; rises about 3 miles northeast of McCollum in Montague County; flows northeasterly 4 miles into Red River (tributary to the Mississippi) about a mile northwest of Rock Bluff Ferry in extreme northwestern part of Cooke County. Montague and Gainesville topographic maps.

CEDAR CREEK.—Milam and Burleson counties; rises in eastern part of Milam County; flows southeasterly into Spring Creek (tributary to Brazos River) 5 miles north of Caldwell.

CEDAR CREEK.—Navarro County; joins Pecan Creek (tributary through Richland Creek to Trinity River) east of Navarro in southeastern part of county.

CEDAR CREEK.—Rockwall, Kaufman, and Henderson counties; rises near Chisholm in southern part of Rockwall County; flows southeasterly 57 miles into Trinity River in southwestern part of Henderson County; in upper part of its course it is called Brushy Bayou.

CEDAR CREEK.—San Saba County; a small intermittent stream 4 miles long in the southwestern part of county; flows through Deer and San Fernando creeks into Llano River, and thus to the Colorado. Mason topographic map.

CEDAR CREEK.—Taylor County; rises west of Lewis Canyon; flows southeasterly 5 miles into Elm Creek (tributary through Clear Fork of Brazos River to the Brazos) west of Buffalo Gap in western part of county. Abilene topographic map.

CEDAR CREEK.—Taylor County; rises near Tuscola; flows northerly 17 miles into Lytle Creek (tributary to Elm Creek which discharges into Brazos River through Clear Fork of the Brazos) at the town of Abilene. Abilene topographic map.

CEDAR CREEK.—Tom Green, Coke, and Runnels counties; rises near the intersection of Tom Green, Coke, and Runnels counties, in northeastern part of Tom Green County; flows northeasterly 3½ miles into Mule Creek (tributary to Colorado River); intermittent. Hayrick topographic map.

CEDAR CREEK.—Terrell County; rises in southwestern part near Brewster-Terrell county line; flows southeasterly 7 miles into Candilla Creek near Candilla Canyon (tributary to Washboard Canyon, San Francisco Creek, and Rio Grande); intermittent. Indian Wells topographic map.

CEDAR CREEK.—Trinity County; stream flowing northeasterly 12 miles into Neches River in northeastern part of county.

CEDAR CREEK.—Uvalde County; a small intermittent tributary to East Nueces River (thence to Nueces River) in northwestern part of county; length, 6 miles. Nueces topographic map.

CEDAR CREEK.—Waller County; rises in the northwestern corner of the county; flows westerly into Beasom Creek and thus to Brazos River. Howth topographic map.

CEDAR CREEK.—Waller County; rises in extreme northwest corner of Waller County; flows westerly 7 miles into Beasons Creek (tributary to Brazos River) near western corner of Grimes and Waller counties.

CEDAR CREEK.—Washington County; rises 1½ miles northwest of Chappel Hill; flows eastward 3 miles into New Years Creek (tributary to Brazos River) 3 miles northeast of Chappel Hill in southeastern part of county.

CEDAR CREEK.—Washington and Lee counties; rises 2 miles northeast of Ledbetter; flows northeasterly 13 miles along Washington-Lee county line into Yegua Creek (tributary to Brazos River) about 4 miles northeast of Calvin.

CEDAR HOLLOW.—Bastrop County; intermittent water course 3 miles in length; rises 1 mile north of Red Rock in the western part of the county; flows northwesterly into Walnut Creek (tributary to Colorado River) 1 mile southeast of Otis. Flatonia and Bastrop topographic maps.

CEDAR LAKE.—Anderson and Freestone counties; a lake or series of sloughs and old river channels—along county boundary between Anderson and Freestone counties west of Palestine. (Trinity River drainage).

CEDAR LAKE CREEK.—Brazoria and Matagorda counties; rises in northwestern part of Brazoria County; flows southeasterly 10 miles through Brazoria County, then 18 miles along the boundary of Brazoria and Matagorda counties and empties into Cedar Lake which drains into the Gulf of Mexico.

CEDRON CREEK.—Bosque County; rises 2 miles southeast of Pilot Knob east of the town of Meridian in central part of county; flows easterly 12 miles into Brazos River south of the Missouri, Kansas & Texas Railway crossing. Meridian and Waco topographic maps.

CELERY CREEK.—Menard County; rises in central part of county; empties into the San Saba and thus to Colorado River; length, 12 miles. Eden topographic map.

CENTER CREEK.—Wise County; small stream flowing to West Fork of Trinity River (tributary to the Trinity) in the central part of the county.

CHACON CREEK.—Webb County; rises northeast of the town of Laredo; flows southerly 5 miles into Rio Grande about a mile south of Laredo; intermittent.

CHALK CREEK.—Angelina and Jasper counties; rises in southeastern part of Angelina County; flows southerly 6 miles; empties into Neches River north of Aldridge in northwestern part of Jasper County.

CHALK CREEK.—Kinney County; a small intermittent tributary to West Nueces River (thence to Nueces River) in the northeastern part of the county; flows southerly 4 miles. Brackett topographic map.

CHALK HOLLOW.—Donley County; small stream rising in eastern part of county and flowing into Salt Fork of Red River, which discharges into the Red through the Prairie Dog Town Fork of the Red and thus to the Mississippi.

CHAMPLINS CREEK, SOUTH FORK.—Mitchell County; rises in eastern part of the county; flows southwestward 11 miles into North Fork of Champlins Creek (tributary to Colorado River) 5 miles southeast of Colorado.

CHAMPLINS CREEK, NORTH FORK.—Mitchell County; rises near Wastella in the northeastern part of the county; flows southwesterly 19 miles into Colorado River about 7 miles south of the town of Colorado near the center of the county.

CHANNEL CREEK.—Williamson County; rises in southern part of county; flows southeasterly 7 miles into Brushy Creek (tributary through San Gabriel River to Little River and thus to the Brazos) 4 miles northeast of Round Rock. Georgetown topographic map.

CHANDLER BRANCH.—Fayette County; north of Muldoon in the west central part of the county; an intermittent tributary through Buckner Creek to Colorado River; length, 5 miles. Flatonia topographic map.

CHAPARROSA CREEK.—Kinney, Maverick and Zavalla counties; rises in the Anacacho Mountains in the southeastern part of Kinney County; flows 6 miles southeasterly through Kinney County, then 28 miles through Zavalla County into Turkey Creek (tributary to the Nueces through Elm Creek); length, 34 miles. Brackett topographic map.

CHEROKEE BAYOU.—Rusk and Gregg counties; rises about 4 miles northwest of Henderson in Rusk County; flows northeasterly 13 miles to the county line, thence easterly 12 miles, forming the boundary between Gregg and Rusk Counties for 5 miles; empties into the Sabine in Rusk County about 5 miles northeast of Tatum.

CHEROKEE CREEK.—Briscoe County; small stream flowing northward about 61 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) in eastern part of the county.

CHEROKEE CREEK, NORTH FORK.—San Saba County; a small stream 4 miles long in the southeastern part of the county; flows southeasterly through Kuykendall's ranch into Cherokee Creek (tributary to Colorado River). Llano topographic map.

CHEROKEE CREEK.—San Saba County; rises in the southern part of the county 10 miles southwest of Cherokee; flows northeastward 34 miles into Colorado River in the southeastern part of the county 1 mile east of Bend. Llano, San Saba, and Lampasas topographic maps.

CHERRY BRANCH.—Burnet County; a small intermittent stream 2 miles long in the northwestern part of the county; flows into Deer Creek and thus to Colorado River. Burnet topographic map.

CHERRY CANYON.—Jeff Davis and Reeves counties; an intermittent stream which sinks soon after entering Reeves County about 7 miles northwest of Toyahale; rises 18 miles west of Fort Davis, in Davis Mountains, Jeff Davis County; flows northwestward 25 miles. Fort Davis topographic map.

CHERRY CREEK.—Edwards County; small intermittent tributary to West Nueces River (tributary to the Nueces) in southern part of the county; unites with West Nueces River at Dobbs Run; flows southerly 5 miles. Nueces topographic map.

CHERRY CREEK.—Howard and Mitchell counties; rises in northeastern part of Howard County; flows southeasterly about 25 miles into Morgan Creek (tributary to the Colorado) 4 miles west of Colorado.

CHERRY CREEK.—Kerr County; southwest of Comfort, in southeastern part of county; tributary to Guadalupe River.

CHERRY SPRINGS CREEK.—Llano County; an intermittent tributary through Hickory Creek to Llano River and thus to the Colorado in the southwestern part of the county; length, 6 miles. Fredericksburg and Llano topographic maps.

Cherrymusco Creek.—Duval, Webb, and La Salle counties; small tributary flowing northwesterly 10 miles into Nueces River near the corner of Duval, Webb, and La Salle counties.

Chiamon Bayou.—San Augustine County; rises in eastern part of county; flows southwesterly 10 miles into Ayish Bayou (tributary to Angelina River, and thus to the Neches).

Chicken Bayou.—Shelby County; small stream flowing into Tancha Bayou (tributary to Sabine River) near Flat Fork in northern part of county.

Chickinee Creek.—Falls County; rises near Rupee; flows southward 3½ miles into Pond Creek (tributary to the Brazos) in southern part of county. Temple topographic map.

Chicolate Creek.—Dewitt, Victoria, Lavaca, and Jackson counties; rises in the eastern part of Dewitt County, where it is known as the South Chicolate Creek; flows southeastward 9 miles through Dewitt Couny, 3 miles through the north corner of Victoria County, then 7 miles through the south corner of Lavaca County to its junction with Little Brushy Creek, forming Chicolete Creek, thence 4 miles through Jackson County into Lavaca River (tributary to Matagorda Bay and Gulf of Mexico); length, 23 miles.

Chigoe Bayou.—Brazoria and Galveston Counties; rises in Brazoria County, northeastern part; flows northeasterly 1 mile through Brazoria County, then 4 miles through Galveston County into Clear Creek (thence to Clear Lake and thus to Gulf of Mexico through Galveston Bay).

Childress Creek.—Bosque and McLennan counties; rises 5 miles northeast of Clifton, in southern part of Bosque County; flows southeasterly 20 miles into Brazos River 3½ miles north of China Springs. Meridian and Waco topographic maps.

Chilipin Creek.—San Patricio County; rises near Sinton, in the north central part of the county; flows northward and eastward 12 miles into Copano Bay, thence to Gulf of Mexico.

Chiltipin Creek.—Duval and Jim Wells counties; rises in the northeastern part of Duval County; flows southeastward to its junction with Pinias Creek (tributary to Gulf of Mexico through Santa Petronilla Creek and Baffins Bay) in the eastern part of Jim Wells County.

Chimney Creek.—Shackleford County; rises 8 miles west of Albany; flows westerly 14 miles into Clear Fork of Brazos River (tributary to the Brazos) near center of eastern line of Jones County. Anson and Albany topographic maps.

China Creek.—San Saba County; flows into San Saba River (tributary to the Colorado) 2 miles northwest of the town of San Saba, in the eastern part of the county; length, 7 miles. San Saba topographic map.

China Creek.—Val Verde County; small stream in northeastern corner of the county; flows northwesterly 6 miles into Buckleys Creek (tributary through Devils River) to Rio Grande.

China Creek.—Wilbarger and Wichita counties; rises in notheastern part of Wilbarger County; flows through northwestern corner of Wichita County into Red River and thus to the Mississippi; intermittent. Electra topographic map.

China Creek.—Fisher County; rises near Palava; flows northeastward 10 miles into Clear Fork of Brazos River (tributary to the Brazos) 2 miles northwest of Newman; intermittent. Roby topographic map.

CLEAR CREEK.—Erath County; small stream flowing northerly to a point 1 mile south of Palo Pinto-Erath county line, where it enters Big Sunday Creek (tributary through Palo Pinto Creek to Brazos River); length, 5 miles. Stephenville topographic map.

CLEAR CREEK.—Ellis County; small stream flowing into Pecan Creek (tributary to Richland Creek, thence to Trinity River) in southeastern part of county.

CLEAR CREEK.—Gonzales County; rises in the southwestern part of the county; flows easterly 9 miles into Castlemans Fork of Sandies Creek (tributary to Sandies Creek and thus to Guadalupe River) near Nixon.

CLEAR CREEK.—Harris and Galveston counties; rises near Almeda in southwestern part of Harris County; flows southeasterly 26 miles, forming the boundary between Harris and Galveston counties almost this entire length; empties into Galveston Bay through Clear Lake, and thus to Gulf of Mexico; tidal in lower course for about 8 miles. Almeda, Mykawa, Genoa, and Seabrook topographic maps.

CLEAR CREEK.—Montgomery County; rises near Willis in Northern part of county; flows southeasterly 7 miles into West San Jacinto River, thence to San Jacinto River, Galveston Bay and Gulf of Mexico.

CLEAR CREEK.—Montague, Cooke, and Denton counties; rises about 4 miles west of Saint Jo in Montague County; flows southeasterly 40 miles into Elm Fork of Trinity River (tributary to the Trinity) about 5 miles northeast of the town of Denton in Denton County. Montague and Gainesville topographic maps.

CLEAR CREEK.—Newton County; rises about a mile east of Burkeville; small stream flowing into McGraw Creek (tributary to Little Cow Creek, thence to Sabine River) in northern part of county.

CLEAR CREEK.—Newton County; rises about 3 miles northeast of Farrsville; flows southeasterly 5 miles into Yellow Bayou (tributary to Little Cow Creek and thus to the Sabine) about 2 miles south of Burkeville.

CLEAR CREEK.—San Augustine County; rises in southern part of county; flows southeasterly 12 miles into Angelina River (tributary to Neches River) south of White City.

CLEAR CREEK.—Upshur County; rises in southeastern part of county; flows northwesterly 7 miles into Little Cypress Creek (tributary to Caddo Lake, thence to Red River, and thus to the Mississippi) southeast of Gilmer.

CLEAR CREEK.—Upshur County; rises about 3 miles southwest of Gilmer in central part of county; flows northeasterly 5 miles into Keley Creek (tributary to Little Cypress Creek, thence through Caddo Lake to Red River and thus to the Mississippi) about 2½ miles north of Gilmer.

CLEAR CREEK.—Williamson County; a stream rising near western county line and flowing southeasterly 4½ miles into North Fork of San Gabriel River (tributary to San Gabriel River and thus through Little River to the Brazos) 2½ miles south of Gabriel Mills. Georgetown topographic map.

CLEAR FORK OF TRINITY RIVER.—Jack, Parker, and Tarrant counties; rises approximately 2 miles south of Gibtown in the extreme southeastern corner of Jack County; flows southeasterly 56 miles into West Fork of Trinity River (tributary to the Trinity) at Fort Worth in central part of Tarrant County. Weatherford and Fort Worth topographic maps.

CLEASON CREEK.—Falls County; rises near Perry in northern part of county; flows southerly 12 miles into Brazos River.

CLEMENS CREEK.—Gonzales County; rises east of Belmont; in northwestern part of county; small intermittent stream flowing into Guadalupe River. San Marcos topographic map.

Click Branch.—Llano County; a small stream 3 miles in length flowing into Barnett Branch, and thus through Sandy Creek to the Colorado in the southeastern part of the county. Llano topographic map.

Click Creek.—Lamar County; rises at Paris in central part of county; flows southeasterly 17 miles into North Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi) in the southeastern part of the county at the southern boundary.

Clifty Creek.—Brazos County; a small stream flowing into Big Creek (tributary to Navasto River and thus to the Brazos) south of Millican in southern part of county. Navasota topographic map.

Clouds Bayou.—Galveston County; rises in the western part of the county; flows southwesterly 3 miles into Halls Bayou, thence to West Galveston Bay and Gulf of Mexico.

Cloice Branch.—McLennan County; small tributary to South Bosque River northwest of Hewitt; partially intermittent. Temple topographic map.

Coal Creek.—Gillespie and Llano counties; rises near Mount Hudson in the northern part of Gillespie County; flows northward 12 miles to its junction with Sandy Creek (tributary to the Colorado) 2½ miles south of Click in southeastern part of Llano County. Fredericksburg and Llano topographic maps.

Coal Kiln Draw.—Sutton County; small intermittent stream 4 miles long in the northeastern part of the county; flows into Terrett Draw, and thus to the San Saba (tributary to Colorado River). Fort McKavette topographic map.

Cob Jones Creek.—Franklin County; a stream 6 miles long flowing southeasterly through northeastern part of county into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

Cobb Creek.—Hill County; rises 2 miles west of Jessie; in southern part of county; flows southwestward 8 miles into Aquilla Creek (tributary to Brazos River) 2 miles northeast of Aquilla. Waco topographic map.

Cobb Gulley.—Harris County; rises 2 miles southeast of Humble in eastern part of county; flows circuitously southeastward, northeastward, and northerly 5 miles into San Jacinto River and thus to the Gulf of Mexico. Harmaston and Moonshine Hill topographic maps.

Cochino Bayou or Hog Creek.—Houston and Trinity counties; rises in the eastern part of Houston County; flows easterly 17 miles into Neches River in northern part of Trinity County about one-half mile below the Eastern Texas Railroad bridge.

Coffee Branch.—Ellis County; small stream flowing into North Fork of Pecan Creek (tributary to Pecan and Richland Creeks, thence to Trinity River) east of Files Valley in southwestern part of county. Cleburne topographic map.

Coffee or Lacy Creek.—Glasscock and Sterling counties; rises near Garden City in the central part of Glasscock County; flows eastward 27 miles into North Concho River (tributary through Concho River to the Colorado) 4 miles west of Sterling City near the center of Sterling County.

Coffee Creek.—Palo Pinto County; a northerly flowing stream joining Brazos River at a point 2 miles southeast of Brazos in southeastern part of county; length, 3 miles. Palo Pinto topographic map.

Coffeemill Creek.—Fannin County; rises about 12 miles north of the town of Bonham; flows easterly 11 miles into Bois d'Arc Creek (tributary to Red River, which discharges into the Mississippi).

COKER CREEK.—Bandera County; an intermittent stream in the eastern part of the county; unites with Medina River (tributary to the San Antonio and thus to Guadalupe River) 5 miles northwest of Bandera.

COLE CREEK.—Jasper, Orange, and Newton counties; rises in southeastern part of Jasper County; flows southeasterly into Sabine River.

COLES CREEK.—Washington County; rises near Brenham; flows southerly 10 miles into East Fork of Mill Creek (tributary to Mill Creek and thus to Brazos River).

COLE CREEK.—Wichita County; rises 4½ miles northwest of Electra in northern part of county; flows northeasterly about 8 miles into Red River (tributary to the Mississippi); partially intermittent. Barwise School topographic map.

COLES CREEK.—Washington County; rises in northeastern corner of county; flows easterly to a point near Old Washington where it enters Brazos River; length, 7 miles. Gay Hill and Navasota topographic maps.

COLETO CREEK.—Dewitt, Goliad, and Victoria counties; formed in the southwestern part of Dewitt County by the junction of east and west branches; flows southeasterly 9 miles through Dewitt County forming the boundary between Dewitt and Goliad counties for 8 miles, along the boundary of Victoria and Goliad counties for 17 miles, thence 11 miles through Victoria County into Guadalupe River about 6 miles below Victoria.

COLETO CREEK, WEST FORK.—Dewitt County; southwestern part; flows southeasterly 9 miles to its junction with East Fork, 4 miles southwest of Yorktown to form Coleto Creek (tributary to Guadalupe River).

COLETO CREEK, EAST FORK.—Karnes and Dewitt counties; rises in the northeastern part of Karnes County; flows southeasterly 2 miles through Karnes County, then 11 miles through Dewitt to its junction with the West Fork 4 miles southwest of Yorktown where it forms Coleto Creek (tributary to Guadalupe River).

COLETO CREEK, WEST BRANCH (EIGHTEENMILE OR MILBY CREEK).—Dewitt and Goliad counties; rises near the southern line of Dewitt County; flows southeasterly 12 miles into Coleto Creek (tributary to the Guadalupe).

COLD CREEK.—San Saba and Llano counties; rises 11 miles southwest of Cherokee in the southern part of San Saba County; flows southward 9 miles into San Fernando Creek (tributary through Llano River to the Colorado) 6 miles southwest of Valley Spring. Llano topographic map.

COLD SPRING CREEK.—Mason and Llano counties; intermittent; rises 2 miles west of Loyal Valley in the southeastern part of Mason County; flows northeastward 8 miles into Hickory Creek (tributary through Llano River to the Colorado). Mason and Llano topographic maps.

COLDWATER CREEK.—Fayette County; small intermittent stream in the southwestern part of the county; flows southeasterly 5 miles to its junction with Rocky Creek (tributary to Mulberry Creek, Navidad and Lavaca rivers and thus to Gulf of Mexico). Flatonia topographic map.

COLDWATER CREEK.—Hutchinson County; rises 9 miles northwest of Plemons; flows southeasterly 10 miles into Canadian River (which discharges into the Mississippi through Arkansas River) 3½ miles northeast of Plemons in central part of county; intermittent.

COLONY CREEK.—Eastland County; rises near north line of county; flows southeasterly through Merriman into Leon River (tributary through Little River to the Brazos) 4½ miles southeast of Merriman. Breckenridge and Eastland topographic maps.

COLORADO RIVER, NORTH FORK.—Borden and Scurry counties; rises in the northern part of Borden County; flows southeasterly about 35 miles into Colorado River southeast of Knapp in southwestern corner of Scurry County.

COLSTON DRAW.—Menard, Kimble, and Schleicher counties; small intermittent stream flowing north into Terrett Draw (tributary to San Saba and Colorado rivers) 3 miles south of Fort McKavett in the southeastern part of Schleicher County. Fort McKavett topographic map.

COLORADO RIVER (OF TEXAS).—Rises in Dawson County near the New Mexico-Texas line; flows in a southeasterly course approximately 600 miles, passes through Ballinger, Austin, Columbus, and Bay City, and enters Matagorda Bay (an arm of Gulf of Mexico) in the south central part of Matagorda County near Matagorda; area of drainage basin in Texas, 37,800 square miles; possibly some contributory drainage area in southeastern New Mexico to Concho River; principal tributaries, Pedernales, Llano, San Saba, and Concho rivers, and Pecan Bayou. The Llano and Concho contribute a large part of the perennial flow.

The country drained below Austin is flat, alluvial bottom land, valuable for agricultural purposes. Although some lands above this point are tillable, in general the stream passes through a limestone formation and the catchment may be classed as rough. Several suitable reservoir sites are available, in the upper drainage basin, for storage of flood waters, but none have been developed above Austin. In Colorado, Wharton, and Matagorda counties large areas of rice are irrigated by pumping water from the stream. Along the river are distributed several dams, the most important of which are: Austin dam, just above the city of Austin at the mouth of a canyon-like channel through the limestone formation; and the San Angelo Light & Power Co.'s dam on South Concho River at San Angelo.

Gaging stations: Bronte, Ballinger, Chadwick, Marble Falls, Austin, Columbus and Wharton.

Precipitation varies from 10 inches in the northwestern part of the catchment to 55 inches near the coast.

Hayrick, Ballinger, Eden, Brady, San Saba, Lampasas, Burnet, Blanco, Austin, Bastrop, and Flatonia topographic maps.

See Second Report of Texas Board of Water Engineers for list of certified filings of appropriations for use of water in this drainage.

COLLARDS CREEK.—Madison County; small stream flowing into Bidais Creek (tributary to the Trinity) in the southeastern part of the county.

COLLEY CREEK.—Cass County; rises about 3½ miles north of Linden in central part of county; flows southeasterly 7 miles into Frazier Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) about 5 miles northeast of Linden.

COLLEGE MOUND CREEK.—Kaufman County; small stream flowing into Mustang Creek (tributary to Cedar Creek, thence to Trinity River) east of Kaufman in central part of county.

COLLEGE MOUND FORK OF CEDAR CREEK.—Kaufman County; rises about 1 mile northeast of the town of Kaufman; flows southwesterly 6 miles into Cedar Creek (tributary to Trinity River) about 4 miles south of Kaufman.

COLLINS CREEK.—Shackleford County; rises 9 miles west of Fort Griffin in northern part of county; flows easterly into Clear Fork of Brazos River (tributary to the Brazos) at Fort Griffin. Albany topographic map.

COLLIER CREEK.—Red River County; rises 5 miles northwest of Annona in eastern part of county; flows southerly 8 miles into Kickapoo Creek (tributary to Cuthand Creek and thus through Sulphur and Red Rivers to the Mississippi).

COLLOM SPRING BRANCH.—Bowie County; rises about 5 miles southeast of New Boston; flows into Rock Creek (tributary through Langum Creek to Sulphur River and thus through Red River to the Mississippi). New Boston topographic map.

COLLUMS SPRING BRANCH.—Bowie County; small stream about 4 miles north of Hooks post office in northeastern part of county; flows into Big Lake. (Red and Mississippi rivers drainage basins).

COMANCHE CREEK.—Anderson County; stream flowing southeasterly, then northeasterly into Ioni Creek (tributary to Neches River) in the southeastern part of the county; length, 9 miles.

COMANCHE CREEK.—Bexar County; small intermittent stream in southern part of county 12 miles south of San Antonio; flows into Leon Creek (tributary through Medina River to the San Antonio and thus to Guadalupe River) 1½ miles above its mouth. San Antonio topographic map.

COMANCHE CREEK.—Blanco and Llano counties; rises in the northern part of Blanco County; flows northward 11 miles into Sandy Creek (tributary to Colorado River) 2 miles southeast of Click in southeastern part of Llano County. Fredericksburg and Llano topographic maps.

COMANCHE CREEK.—Mason County; rises 4 miles north of the town of Mason in the central part of the county; flows southeastward 14 miles through Mason into Llano River (tributary to the Colorado) 2 miles southwest of Hedwigs Hill. Mason topographic map.

COMANCHE CREEK.—Pecos County; rises about 35 miles southwest of Fort Stockton; flows northerly 25 miles to Fort Stockton where it unites with Comanche Springs to form Comanche Creek (main stream); from this point it takes a northeasterly course 25 miles to its junction with Pecos River (tributary to Rio Grande) 8 miles east of Buena Vista.

COMANCHE CREEK.—San Saba County; a small tributary to Colorado River to the east of Indian Creek in the southwestern part of the county; length, 7 miles. Brownwood and San Saba topographic maps.

COMANCHE CREEK.—Zavalla County; small stream 15 miles long flowing northeastward to its junction with Elm Creek (tributary to the Nueces) in southwestern part of county.

COMAL RIVER.—Comal County; perennial stream formed about 1 mile northwest of New Braunfels by a series of large springs; flows southeasterly 2 miles into Guadalupe River in the edge of the city of New Braunfels. Flood water channel extends southwest for several miles above springs. This stream is important for its power value and water supply for municipal and irrigation purposes.

COMMISSIONERS CREEK.—Bandera County; small tributary to Hondo River (thence to the Nueces through Frio River) in the southern part of the county; flows southwestward 5 miles.

COMOJELANO CREEK.—San Augustine County; rises in southwestern part of county; flows southeasterly 7 miles into Ayish Bayou, and thus to Angelina and Neches rivers.

CONCEPCION CREEK.—Duval County; rises on Duval-Webb county line near Moglia; flows southeastward 35 miles into Olmos Creek (thence to Gulf of Mexico through Baffins Bay) at Santa Cruz.

CONEJOS CREEK.—Zavalla County; small intermittent tributary to Muela Creek (thence to Nueces River through Chapparosa, Turkey, and Elm creeks) in the northwestern part of Zavalla County; length, 3 miles. Brackett topographic map.

CONCHO RIVER.—Tom Green and Concho counties; formed at the city of San Angelo, Tom Green County, by junction of North and South Concho rivers; flows easterly 24 miles through Tom Green County, then 29 miles through Concho County into Colorado River 12 miles northeast of Paint Rock, in the northwestern part of Concho County.

Above San Angelo the waters of the tributaries are used extensively for irrigation and municipal operations, and in vicinity of Paint Rock and south of Miles small areas are also irrigated; a dam has been constructed at San Angelo on South Concho River by the San Angelo Light & Power Co. to impound water for city use. Several smaller dams for storage purposes have been constructed, but there are no water-power developments in the basin. Area of drainage basin, 12,000 square miles (includes North and South Concho rivers). Gaging stations at San Angelo and near Paint Rock. Sherwood, Hayrick, San Angelo, Ballinger, and Eden topographic maps.

See Second Report of Texas Board of Water Engineers for list of certified filings of appropriations for uses of water.

CONGLOMERATE CREEK.—Donley County; a stream 3 miles long flowing southerly through northeastern part of county into Whitefish Creek (tributary to Salt Fork of Red River, thence to Prairie Dog Town Fork of the Red and thus to the Mississippi through Red River).

CONKLIN CREEK.—Childress County; rises about 2 miles north of Childress in central part of county; flows northerly 9 miles into Prairie Dog Town Fork of Red River, thence to Red River and thus to the Mississippi.

CONNER CREEK.—Houston County; a stream 6 miles long flowing easterly into Neches River in northeastern part of the county.

CONNERS CREEK.—Young County; a stream in northeast corner of county; flows southerly 7 miles into Brazos River southeast of Graham.

CONTRARY CREEK.—Hood County; an intermittent stream rising at Neri and flowing northerly 4 miles into Brazos River southeast of Granbury. Granbury topographic map.

COOK SLOUGH.—Zavalla County; a small intermittent tributary to Leona River (thence to the Nueces through Frio River) in the northern part of the county; length, 7 miles. Uvalde topographic map.

COOKS SLOUGH.—Uvalde County; an intermittent tributary to Leona River thence to the Nueces through Frio River) in the west central part of county; rises 10 miles north of Uvalde on south side of Green Mountain; flows southeasterly 17 miles. Uvalde topographic map.

COON CREEK.—Bosque County; rises 3 miles west of Merrivale; flows northeasterly 8 miles into Brazos River in southeastern part of county. Waco topographic map.

COON CREEK.—Fort Bend County; rises midway between Rosenberg and Beasley in central part of county; flows southeasterly 5 miles into Cottonwood Creek (tributary through Big Creek to Brazos River).

COOPERS CREEK.—Garza County; rises 5 miles southeast of Post in southern part of county; flows southerly 9 miles into Double Mountain Fork of Brazos River (tributary to Brazos River).

COOPER CREEK.—Kent County; rises in southern part of county; flows northerly 10 miles into Double Mountain Fork of Brazos River (tributary to Brazos River).

COOSE BRANCH.—Erath County; rises 2 miles northeast of Lingleville in western part of county; flows southeasterly 5 miles into South Bosque River (tributary to the Bosque). Stephenville topographic map.

COPANO CREEK.—Refugio County; rises southeast of Vidauri in central part of county; flows southward 8 miles through Refugio County, then 7 miles along the boundary of Refugio and Aransas counties into Copano Bay, an arm of Gulf of Mexico.

COPELAND CREEK.—Montague County; joins Elm Fork of Trinity River (tributary to the Trinity) about 3 miles southeast of Saint Jo; short intermittent stream. Gainesville topographic map.

COPPERAS CREEK.—Bastrop County; rises 4 miles southeast of Bastrop in central part of county; flows into Colorado River; length, 4 miles. Bastrop topographic map.

COPPERAS CREEK.—Caldwell, Bastrop and Gonzales counties; rises east of Delhi in southern part of Bastrop County; flows through eastern corner of Caldwell County to its junction with Peach Creek (tributary to the Guadalupe) 4 miles east of Waelder. Flatonia topographic map.

COPPERAS CREEK.—Caldwell County; rises south of Tilmon in southern part of County; flows into Plum Creek and thus through San Marcos River to the Guadalupe; intermittent. San Marcos topographic map.

COPPERAS OR RUSH CREEK.—Comanche and Eastland counties; rises at Rising Star in southern part of Eastland County; flows southeastward 32 miles into Leon River (tributary to Little River and thus to the Brazos) 7 miles northeast of Comanche near the center of Comanche County. Eastland and Brownwood topograhic maps.

COPPERAS CREEK.—Kimble County; small stream in northwestern part of county flowing 6 miles to its junction with North Llano River (tributary through Llano River to the Colorado). Fort McKavett topographic map.

COPPERAS CREEK.—Robertson County; small stream flowing into Big Cedar Creek (which discharges into Brazos River through the Navasota) northwest of Wheelock in southeastern part of county; length, 3 miles.

CORD WOOD CREEK.—Shackelford County; a stream flowing easterly 5 miles into Deep Creek (which discharges into Hubbard and Gonzales creeks and thus through Clear Fork of Brazos River to the Brazos) 1 mile west of Hulltown in southern part of county. Albany topographic map.

CORNELIUS CREEK.—Grayson County; rises 6 miles north of Whitewright in eastern part of county; flows northwestward 5½ miles into Mill Creek (tributary to Choctaw Creek and thus through Red River to the Mississippi) about 7½ miles southeast of Denison.

CORN CREEK.—McCulloch County; small tributary to Colorado River in northeastern part of the county northwest of Cowboy; length, 10 miles. Brady topographic map.

CORRALL CREEK.—Bowie County; a small intermittent stream entering Howard Creek (tributary to Hurricane Creek, and thus through Sulphur and Red rivers to the Mississippi) about 3 miles southwest of Taxarkana in eastern part of county. Texarkana topographic map.

CORRALL CREEK.—Potter County; a stream rising in northwestern part of county and flowing southwesterly 5 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 1½ miles east of Amy.

CORRELL CREEK.—Irion and Reagan counties; small stream flowing southward 9 miles along the Irion-Reagan county line to its junction with Middle Concho River (tributary to South Concho River, and thus through the Concho to Colorado River) in northwestern part of Irion County.

CORWINS CREEK.—Borden County; a stream 11 miles long flowing through the southeastern part of the county into Colorado River.

CORYELL CREEK.—Coryell County; rises near Pancake in extreme northern part of county; flows southeasterly 24 miles into Leon River (tributary to Little River and thus to the Brazos) one mile south of Pecan Grove. Meridian and Gatesville topographic maps.

COTTON CREEK.—Young County; flows southerly 5 miles into Brazos River 2 miles northwest of New Castle in western part of county.

COTTON CREEK.—Jefferson County; small stream rising near Nome in northwestern part of county and flowing northeasterly into Pine Island Bayou tributary to Neches River) 2 miles west of Wertbury.

COTTON PATCH BAYOU.—Harris County; small tidal bayou in the southeastern part of the county, northeast of Pasadena; flows northeasterly about 2 miles into Ship Channel (Buffalo Bayou) thence to Galveston Bay and Gulf of Mexico.

COTTONWOOD ARROYO.—Oldham and Potter counties; an intermittent stream 6 miles long flowing northeasterly to Canadian River (tributary to Arkansas River and thus to the Mississippi) 5 miles southeast of Tascosa, near line of Potter and Oldham counties.

COTTONWOOD CREEK.—Armstrong and Donley counties; rises in southeastern part of Armstrong County; flows easterly 9 miles into Mulberry Creek (tributary to Prairie Dog Town Fork of Red River, and thus through Red River to the Mississippi) in southwestern part of Donley County.

COTTONWOOD CREEK.—Armstrong County; rises in western part of county; flows eastward 3 miles into Dry Creek (tributary to Prairie Dog Town Fork of Red River and thus to the Red and Mississippi rivers).

COTTONWOOD CREEK.—Armstrong County; rises about 7 miles southeast of Claude in northeastern part of county; flows easterly 9 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi River) in northern part of the county about three-fourths mile west of eastern boundary of county.

COTTONWOOD CREEK.—Bell County; small stream 10 miles long flowing southeasterly into Big Elm Creek (tributary through Little River to the Brazos) 5 miles south of Oenaville. Temple topographic map.

COTTONWOOD CREEK.—Brewster County; a small stream uniting with Rough Run (tributary to Terlingua Creek and thus to Rio Grande) 8 miles above mouth of Rough Run in southern part of county. Chisos Mountains topographic map.

COTTONWOOD CREEK.—Collingsworth County; rises in central part of county; flows southerly 5 miles into Salt Fork of Red River (tributary through Prairie Dog Town Fork of Red River to the Red and thus to Mississippi).

COTTONWOOD CREEK.—Collin, Dallas, and Rockwall counties; rises in the southeastern corner of Collin County; flows 5 miles southeasterly through the corners of Dallas and Rockwall counties into the East Fork of Trinity River (tributary to Trinity River). Dallas and Rockwall topographic maps.

COTTONWOOD CREEK.—Cottle County; rises about 5 miles northeast of Paducah; flows southeasterly 10 miles into North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

COTTONWOOD CREEK.—Coryell County; a small intermittent stream flowing northeasterly 7 miles into Leon River (tributary to Little River and thus to the Brazos) 2 miles south of Gatesville. Gatesville topographic map.

COTTONWOOD CREEK.—Coryell County; rises near Twin Mountains in southern part of county; flows northeasterly 8 miles into Cowhouse Creek (tributary to Leon River, and thus through Little River to the Brazos) 6 miles southeast of Pidcoke. Gatesville topographic map.

COTTONWOOD CREEK.—Dallas County; small tributary to Trinity River north of Wilmer in southeastern part of county. Dallas topographic map.

COTTONWOOD CREEK.—Dewitt and Victoria counties; rises in south-central part of Dewitt County; flows southeasterly 17 miles through Dewitt County, then 4 miles through Victoria County into Coleto Creek (tributary to Guadalupe River) in western part of Victoria County.

COTTONWOOD CREEK.—Dickens County; rises 3 miles west of Hay Stack Mountain; flows southeasterly 10 miles into Duck Creek (tributary through Salt Fork of Brazos River to the Brazos) 5 miles southwest of Dickens in southern part of county.

COTTONWOOD CREEK.—Ellis County; small stream flowing into Pecan Creek (tributary to Richland Creek, thence to the Trinity) in the southwestern part of the county.

COTTONWOOD CREEK.—Ellis County; small stream flowing into Brushy Creek (tributary to Red Oak Creek, and thus to the Trinity) in the northeastern part of the county. Dallas topographic map.

COTTONWOOD CREEK.—Ellis County; flows northerly 6 miles into Mountain Creek (which discharges into Trinity River through West Fork of the Trinity) in northwestern part of county. Cleburne and Fort Worth topographic maps.

COTTONWOOD CREEK.—Erath County; rises at the town of Dublin; flows easterly 8 miles into Green Creek (tributary to Bosque River and thus to the Brazos) 1 mile northeast of Alexander in southern part of county. Stephenville topographic map.

COTTONWOOD CREEK.—Fisher County; an intermittent stream flowing southward 3 miles to its junction with Sweetwater Creek (tributary through Clear Fork of Brazos River to the Brazos) near Eskota. Roby topographic map.

COTTONWOOD CREEK.—Fisher County; rises near Claytonville; flows northeasterly 20 miles into Clear Fork of Brazos River (tributary to the Brazos) 4 miles north of Roby in central part of county. Roby topographic map.

COTTONWOOD CREEK.—Gillespie County; a small stream 3 miles in length flowing into White Oak Creek, and thus through the Pedernales to Colorado River in the southwestern part of county. Kerrville topographic map.

COTTONWOOD CREEK.—Ford Bend County; rises near Beasley in western part of county; flows easterly 9 miles into Big Creek and thus to Brazos River.

COTTONWOOD CREEK.—Guadalupe County; small stream joining Guadalupe River about 3 miles south of Seguin. San Marcos topographic map.

COTTONWOOD CREEK.—Hays and Guadalupe counties; rises about 3 miles south of the town of San Marcos; flows southeasterly 3 miles through Hays County, then 8 miles through Guadalupe County where it joins York Creek (tributary to San Marcos River and thus to the Guadalupe) about 4 miles southwest of Staples. San Marcos topographic map.

COTTONWOOD CREEK.—Hill County; small stream flowing to a point north of Itasca in northern part of county, where it enters Island Creek, thence to North Fork of Pecan Creek (which discharges into Trinity River through Pecan and Richland creeks). Cleburne topographic map.

COTTONWOOD CREEK.—Hill County; rises 2 miles southeast of Covington in northern part of county; flows southward 9 miles, passing through the village of Osceola, to a point 1½ miles west of Woodbury where it enters Aquilla Creek and thence to Brazos River. Cleburne topographic map.

COTTONWOOD CREEK.—Hutchinson County; an intermittent stream 5 miles long flowing southerly to its junction with Canadian River (tributary to Arkansas River and thus to the Mississippi) 5 miles southwest of Plemons in central part of county.

COTTONWOOD CREEK.—Jones County; a partially intermitent stream rising 6 miles east of Anson and flowing easterly 10 miles into Clear Ford of Brazos River (which discharges into the Brazos) north of Lueders near western Shackelford county line. Anson topographic map.

COTTONWOOD CREEK.—Johnson and Ellis Counties; rises 4 miles east of Alvarado in the eastern part of Johnson County; flows southeasterly 8 miles into Onion Creek (tributary through North Fork of Pecan Creek to Pecan Creek, thence to Trinity River) 3 miles north of Auburn in the western part of the county. Cleburne topographic map.

COTTONWOOD CREEK.—Karnes County; small stream flowing through the southern part of the county into Hondo Creek (tributary through San Antonio River to the Guadalupe).

COTTONWOOD CREEK.—King County; rises in northwestern part of county; flows northeasterly 4 miles into North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

COTTONWOOD CREEK.—Leon County; a small stream flowing into Keechi Creek (tributary to Trinity River) about 5 miles east of Jewett.

COTTONWOOD CREEK.—Lipscomb County; an intermittent stream flowing northeasterly 10 miles, joining Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through the Arkansas to the Mississippi) 4 miles east of Lipscomb in the central part of county.

COTTONWOOD CREEK.—Llano County; a small intermittent stream 3 miles long, in the southwestern part of the county; connects with Hickory Creek (tributary to Llano River and thus to the Colorado). Llano topographic map.

COTTONWOOD CREEK.—Llano County; an intermittent stream 4 miles long flowing into Bullhead Creek (tributary to Hickory Creek and thus through Llano River to the Colorado) north of Starkes, in the southwestern part of county. Llano topographic map.

COTTONWOOD CREEK.—Llano County; a stream 4 miles in length flowing into Sandy Creek (tributary to Colorado River) east of Click, in the southeastern part of the county. Llano topographic map.

COTTONWOOD CREEK.—Llano County; a stream 4 miles long flowing through the southern part of the county to its junction with Sandy Creek (tributary to the Colorado) near Moss Ranch. Llano topographic map.

COTTONWOOD CREEK.—Matagorda County; rises in the central part of the county; flows southeasterly 4 miles into Prairie Creeek, and thus to Live Oak Creek, Matagorda Bay, and Gulf of Mexico.

COTTONWOOD CREEK.—McLennan County; rises 4 miles southwest of Waco; flows northeasterly 8 miles into Brazos River. Waco topographic map.

COTTONWOOD CREEK.—Montague County; rises about 2 miles northeast of Bonito, in norheastern part of county; flows northerly 13 miles into Red River (tributary to the Mississippi) about 4 miles southeast of Old Spanish Fort. Montague topographic map.

COTTONWOOD CREEK.—Motley County; a stream 4 miles long flowing northerly through northern part of county to Hornica Creek, thence to Pease River, and thus through Red River to the Mississippi.

COTTONWOOD CREEK.—Navarro County; a stream flowing into Richland Creek (tributary to Trinity River) west of the town of Corsicana, in west central part of county.

COTTONWOOD CREEK.—Nolan County; rises northeast of Hylton, in the southeastern part of the county; flows 5 miles into Spring Creek and thus through Valley Creek to the Colorado. Sweetwater topographic map.

COTTONWOOD CREEK.—Parker and Hood Counties; joins Kickapoo Creek (tributary to Brazos River) a mile southwest of Buckner; length, 5 miles. Weatherford topographic map.

COTTONWOOD CREEK.—San Saba County; a small tributary to Colorado River south of Regency, in the northeastern part of county; length, 9 miles. San Saba topographic map.

COTTONWOOD CREEK.—Scurry County; rises 8 miles northeast of Snyder, in central part of county; flows northeasterly 5 miles into Rockwall Creek (tributary through Rough Creek to Double Mountain Fork of Brazos River, thence to the Brazos) in northeast part of county.

COTTONWOOD CREEK.—Stephens County; a stream 4 miles long flowing easterly into North Palo Pinto Creek (which discharges through Palo Pinto Creek into Brazos River) 5 miles north of Ranger, in southeastern part of county. Breckenridge topographic map.

COTTONWOOD CREEK.—Stonewall and Kent counties; a small stream flowing northeasterly into Croton Creek (tributary to Brazos River); length, 3 miles.

COTTONWOOD CREEK.—Tarrant and Dallas counties; rises about 2 miles southeast of Arlington, in Tarrant County; flows northeasterly 8 miles into Mountain Creek (tributary to West Fork of Trinity River and thus to the Trinity) about 3 miles southeast of Grand Prairie, in Dallas County. Fort Worth and Dallas topographic maps.

COTTONWOOD CREEK.—Travis County; rises 2 miles west of Rices Crossing, in eastern part of county; flows southerly 11 miles into Wilbarger Creek and thus to Colorado River. Austin and Bastrop topographic maps.

COTTONWOOD DRAW.—Brewster County; an intermittent stream 3 miles long entering Tornillo Creek (tributary to Rio Grande) 15 miles northwest of Boquillas, in southern part of county. Chisos Mountains topographic map.

COTTONWOOD MOTT CREEK.—Motley County; rises about 3 miles northeast of Lyman, in western part of county; flows northeasterly 6 miles into Middle Pease River (tributary to Pease River and thus through Red River to the Mississippi) about 9 miles northwest of Matador.

COUNCIL BRANCH.—Erath County; a southeastward flowing stream 3 miles long, joining South Bosque River (tributary to Bosque River and thus to the Brazos) north of Lingleville, in western part of county. Stephensville topographic map.

COUNCIL CREEK.—Burnet County; stream 6 miles long east of Bluffton in northwestern part of the county; flows into North Fork of Morgan Creek and thus to the Colorado. Burnet topographic map.

COUNTS CREEK.—Erath County; a stream 8 miles long flowing southeasterly to a point 2 miles east of Morgans Mill, where it enters North Paluxy Creek (tributary to Paluxy Creek and thus to the Brazos) in northern part of county. Stephenville topographic map.

COVE CREEK.—Stephens and Young counties; an intermittent stream rising in the northeastern corner of Stephens County and flowing northeasterly 6 miles into Brazos River. Breckenridge topographic map.

COW BAYOU.—Falls and McLennan counties; formed by the junction of North and South Coy bayous 1 mile north of Mooresville; from thence the stream flows easterly 12 miles into Brazos River, 6 miles northwest of Marlin. Temple topographic map.

Cow Bayou.—Jasper, Newton, and Orange counties; rises in southeastern part of Jasper County; flows southeasterly 28 miles into Sabine River in southern part of Orange County about 5 miles south of Orange.

Cow Branch.—Kent and Scurry counties; rises in northeastern part of Scurry County; flows easterly into Double Mountain Fork of Brazos River (tributary to Brazos River); length, 4 miles.

Cow Branch.—Runnels County; a stream 7 miles long joining Mustang Creek (tributary to Colorado River) 3 miles northeast of Norwood in the southeastern part of the county. Ballinger topographic map.

Cow Creek.—Brazoria and Fort Bend counties; rises near Demon in western part of Brazoria County; flows easterly 8 miles along the boundary line between Brazoria and Fort Bend counties into Brazos River northwest of Otey.

Cow Creek.—Brewster County; rises in eastern part, 12 miles northwest of Bullis Gap; flows southwesterly 15½ miles into San Francisco Creek and thus to Rio Grande; intermittent. Bullis Gap and Indian Wells topographic maps.

Cow Creek.—Burnett and Travis counties; rises 7 miles southeast of the town of Burnet in the southeastern part of Burnet County; flows southeasterly 8 miles through Burnet County, then 12 miles through the northwestern part of Travis County into Colorado River 3 miles east of western Travis County line. Burnet and Blanco topographic maps.

Cow Creek.—Coleman County; a small stream north of Coleman in the northwestern part of the county; flows into Jim Ned Creek (tributary to Pecan Bayou and thus to the Colorado); length, 6 miles. Coleman topographic map.

Cow Creek.—Coke County; an intermittent stream south of Hayrick in the eastern part of the county; flows into Colorado River; length, 7 miles. Hayrick topographic map.

Cow Creek.—Erath and Comanche counties; flows southwestward 10 miles into Armstrong Creek (tributary to Leon River and thus through Little River to the Brazos) northwest of the village of Dublin. Stephenville topographic map.

Cow Creek.—Donley County; a stream 3½ miles long flowing southerly through east central part of county into Salt Fork of Red River (tributary through Prairie Dog Town Fork of the Red to Red River and thus to the Mississippi).

Cow Creek.—Duvall and McMullen counties; rises in the northern part of Duval County; flows northward 5 miles through Duval County, then 12 miles through McMullen County into Nueces River.

Cow Creek.—Kinney County; rises 4 miles south of Newel; flows southwesterly 12 miles into Rio Grande in southwestern corner of county.

Cow Creek.—McCulloch County; north of the town of Brady in northern part of county; flows into Colorado River; length, 18 miles. Brady topographic map.

Cow Creek.—Val Verde County; rises about 6 miles north of Comstock; flows southerly 20 miles to its junction with Rio Grande 6 miles southwest of Feely in southern part of county.

Cowan Creek.—Llano County; a stream 2 miles long southeast of Tow in the northeastern part of the county; flows into Colorado River. Burnet topographic map.

COWHOUSE CREEK.—Mills, Hamilton, Coryell, and Bell counties; rises about 8 miles northeast of Mullen in northern part of Mills County; flows southeasterly 85 miles into Leon River (tributary through Little River to the Brazos) about 3 miles southeast of Sparta in northern part of Bell County. Brownwood, Hamilton, Lampasas, and Gatesville topographic maps.

COWLEACH FORK OF SABINE RIVER.—Hunt County; rises in northwestern part of the county; flows southeasterly 34 miles to its confluence with Caddo Fork of Sabine River (thence to Sabine River) in southeastern part of county.

COWPEN CREEK.—Travis and Caldwell counties; rises in the southern part of Travis County; flows southerly 7 miles into Elm Creek (tributary through Plum Creek to San Marcos River and thus to the Guadalupe) 1 mile southwest of Rogers Branch School. Austin and San Marcos topographic maps.

COX CREEK.—Hunt County; small stream flowing into Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of the Sabine) in the north central part of county.

COYOTE CREEK.—Armstrong County; rises in the south central part of county; flows southwesterly 6 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi).

COYOTE CREEK.—Runnels County; an intermittent stream rising northwest of Ballinger and flowing into Elm Creek (tributary to the Colorado) in the northwestern part of county; length, 25 miles. Sweetwater, Hayrick, and Ballinger topographic maps.

CRABAPPLE CREEK.—Gillespie and Llano counties; rises 10 miles north of Fredericksburg in northern part of Gillespie County; flows northeastward 20 miles into Sandy Creek 4 miles south of Oxford, Llano County, and thus to Colorado River. Fredericksburg and Llano topographic maps.

CRANE BAYOU.—Jefferson County; small stream in extreme eastern corner of county, about midway between Port Arthur and mouth of Neches River; flows southerly 3½ miles into Sabine Lake, thence through Sabine Pass to the Gulf of Mexico.

CRAWFORD CREEK.—Menard County; a stream flowing through the eastern part of county into San Saba River (tributary to the Colorado); length, 6 miles.

CREENS CREEK.—Fayette County; small stream in northwestern part of county; flows into Rabbs Creek and thus to Colorado River; length, 5 miles.

——— CREEK.—Willacy County; rises in the southern part of the county; flows eastward 20 miles into Laguna Madre, an arm of Gulf of Mexico.

——— CREEK.—Lavaca County; rises in central part of county; flows southeasterly 11 miles into Navidad River and thus to Gulf of Mexico through Lavaca River and Matagorda Bay.

CRIER CREEK.—Colorado County; a small stream in the western part of county, flowing southerly 5 miles, uniting with Colorado River 9 miles northwest of Columbus.

CRISWELL CREEK.—Fayette County; small intermittent stream in northwestern part of county; flows into Colorado River 1 mile northeast of West Point; length, 4 miles. Flatonia topgraphic map.

CROCKERY CREEK.—Hood County; rises south of Lipan near Erath-Hood county line; flows northerly 5 miles into Kickapoo Creek (tributary to Brazos River) 1½ miles northeast of Lipan in northwestern corner of county. Stephenville and Palo Pinto topographic maps.

CROCKETT CREEK.—Anderson County; small stream flowing into Trinity River about 2 miles east of Magnolia in southwestern part of the county.

CROCKETT CREEK.—Lamar County; formed about 6 miles south of Paris in southern part of county by union of East and West Forks of Crockett Creek; flows southeastward into North Sulphur River (tributary through Sulphur River to Red River and thus to the Mississippi) in the southern part of county at the southern boundary line; length, 9 miles.

CROCKETT CREEK, WEST FORK.—Lamar County; rises about 6 miles southwest of Paris in southern part of county; flows southeasterly 3½ miles to a point about 6 miles south of Paris where it joins East Fork of Crockett Creek forming Crockett Creek (tributary to North Sulphur River, thence through Sulphur River to Red River and thus to the Mississippi).

CROCKETT CREEK, EAST FORK.—Lamar County; rises about 4 miles southwest of Paris in southern part of county; flows southward 3 miles to its junction with West Fork of Crockett Creek forming Crockett Creek (tributary to North Sulphur River, Sulphur River, and thus to the Mississippi through Red River) 6 miles south of Paris in southern part of county.

CROOKED BRANCH.—Caldwell County; east of Fentress; an intermittent tributary to San Marcos River, and thus to the Guadalupe. San Marcos topographic map.

CROOKED CREEK.—Edwards County; small intermittent tributary to West Nueces River (thence to the Nueces) in western part of county; flows southeasterly 6 miles. Nueces topographic map.

CROOKED CREEK.—Jack County; small stream flowing through northern part of county into West Fork of Trinity River (tributary to Trinity River) north of Jacksboro.

CROOKED CREEK.—Lavaca County; rises 4 miles east of Sublime near Lavaca-Colorado county line; flows southwestward 9 miles into Navidad River (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico) 4 miles south of Sublime.

CROOKED CREEK.—Van Zandt County; rises about 3 miles northwest of Canton; flows northeasterly 12 miles into Giladon Creek, thence to Sabine River.

CROOKED CREEK.—Young County; rises near Bryson in eastern part of county; flows westerly 6 miles into Pleasant Creek (tributary to Salt Creek and thus to Brazos River) 2 miles south of Lacy Post Office.

CROOKED LAKE.—Fort Bend County; 5 miles northeast of the town of Richmond in Oyster Bayou drainage (Brazos River drainage); small.

CROSS BRANCH.—Somervell County; an intermittent stream rising in eastern part of county at Seven Knobs and flowing northerly 6 miles into Paluxy Creek (tributary to Brazos River) at Glenrose. Granbury topographic map.

CROSS CREEK.—Williamson and Lee County; rises in the southeast corner of Williamson County; flows southeasterly 10 miles into Second Yegua Creek (tributary through Yegua Creek to Brazos River) 3 miles south of Florence. Bastrop topographic map.

CROSSTIMBER CREEK.—Hopkins County; small stream in northeastern part of county flowing southeasterly 8 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

CROTON CREEK, NORTH FORK.—Stonewall and Kent counties; a stream flowing southeasterly 5 miles to its junction with the Middle Fork of Croton Creek to form Croton Creek which discharges into Brazos River through the Salt Fork of the Brazos.

CROTON CREEK.—Stonewall and King counties; rises near Dickens-King county line; flows easterly 36 miles into Brazos River in the northeastern corner of Stonewall County.

CROTON CREEK, MIDDLE FORK.—Stonewall and Kent counties; a stream 7 miles long flowing southeasterly to its union with North Fork of Croton Creek forming Croton Creek (tributary through Salt Fork to Brazos River to the Brazos).

CROTON CREEK.—Stonewall and Kent counties; formed near Stonewall-Kent county line by union of North and Middle forks of Croton Creek; flows easterly 8 miles into Salt Fork of Brazos River (tributary to the Brazos) north of Croton in northwestern part of county.

CROW CREEK.—Cass County; rises near Lone Oak School in northwestern part of county; flows northerly about 2 miles into Sulphur River (tributary to Red River and thus to the Mississippi). Daingerfield topographic map.

CROW CREEK.—Wheeler and Collingsworth counties; rises in southeastern part of Wheeler County; flows southeasterly 8 miles into Elm Fork of Red River (tributary to North Fork of Red River and thus through the Red to Mississippi River) in northeastern part of Collingsworth County.

CROWNEST CREEK.—Coke, Runnels, and Tom Green counties; rises near the line of Coke and Tom Green counties; flows southeastward 18 miles, crosses the southwest corner of Runnels County and joins Concho River (tributary to the Colorado) 5 miles southwest of Miles in the northeastern part of Tom Green County. Hayrick topographic map.

CROW HOLLOW.—Donley County; rises about 2 miles southwest of Rowe; flows northerly 4½ miles into Lake Creek (tributary to Salt Fork of Red River, thence through Prairie Dog Town Fork of the Red to Red River and thus to the Mississippi).

CRUTCHER CREEK.—Bowie County; rises about 5 miles southwest of Texarkana in eastern part of county; flows southerly 4 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) ½ mile southwest of Sulphur. Texarkana topographic map.

CRYERS BRANCH.—Mills County; a small stream joining Brown Creek (tributary through Pecan Bayou to the Colorado) 4 miles east of Williams Ranch in the central part of the county; length, 6 miles. Brownwood topographic map.

CUERO CREEK.—Dewitt County; small stream in northern part of county; flows southwestward 8 miles to its junction with Guadalupe River 4 miles north of Cuero.

CUEVAS CREEK.—Maverick County; small intermittent stream in southern part of county; formed by the union of two small branches (names not given on map) 3 miles above its mouth; flows westward into Rio Grande 17 miles southeast of the town of Eagle Pass.

CULEBRA CREEK.—Bexar County; rises northwest of San Antonio; flows into Leon Creek (tributary to Medina River and thus through the San Antonio to Guadalupe River); intermittent. San Antonio topographic map.

CULVERS CREEK.—Scurry County; rises in the northwestern part of county; flows southeastward about 37 miles through the town of Snyder into Colorado River near the middle of south county line.

CUMMINS CREEK.—Fayette and Colorado counties; rises in northern part of Fayette County near Ledbetter; flows southeasterly 23 miles through the eastern part of Fayette County, then 14 miles through Colorado County in Colorado River north of Columbus; length, 37 miles.

CUMMINS CREEK.—Ellis and Navarro counties; rises south of Ennis in southeastern part of Ellis County; flows southerly to its unction with Pecan Creek (tributary through Richland Creek to Trinity River) in the northeastern part of Navarro County.

CUNDIFF CREEK.—Jack County; joins West Fork of Trinity River (tributary to the Trinity) northeast of Jacksboro in the northeastern part of county.

CURLOW LAKES.—Dallam County; northeast of Texline in northwestern part of county between Mustang and Rabbit Ear Creek drainages; very small.

CURRY CREEK, MIDDLE PRONG.—Kendall County; head of Curry Creek (tributary to Guadalupe River); joins East and West Prong of Curry Creek to form Curry Creek.

CURRY CREEK, EAST PRONG.—Kendall County; headwater tributary to Curry Creek (thence to Guadalupe River) near Kendalia in northeastern part of county. Curry Creek formed by confluence with Middle and West Prong of Curry Creek.

CURRY CREEK.—Kendall County; rises in the northeastern part of county; flows southeasterly 15 miles entering Guadalupe River at its intersection with the southeastern boundary of the county.

CURRY CREEK, WEST PRONG.—Kendall County; rises near Kendalia in northeastern part of the county; headwater stream uniting with East and Middle Prongs of Curry Creek to form Curry Creek (tributary to Guadalupe River).

CURRYCOMB BRANCH.—Eastland and Comanche counties; rises 2 miles northeast of Jewell; flows southeasterly 6 miles into Sabanna River (tributary through Leon and Little rivers to the Brazos) 3½ miles southeast of Jewell in northern part of Comanche County. Eastland topographic map.

CUSH CREEK.—Matagorda County; rises in the western part of the county; flows southerly 8 miles through Tres Palacios Bay into Matagorda Bay and Gulf of Mexico.

CUTHAND CREEK.—Red River County; rises about 8 miles south of Detroit in western part of county; flows southeasterly 28 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) about 13 miles south of Annona in southern part of county.

CYCLONE BRANCH.—Bell County; small stream flowing southerly into Camp Creek (tributary to Big Elm Creek, and thus through Little River to the Brazos) south of Oker in eastern part of county. Temple topographic map.

CYPRESS CREEK.—Angelina and Jasper counties; rises in southern part of Angelina County; flows southerly 8 miles into Neches River near Rockland in the northwestern part of Jasper County.

CYPRESS CREEK.—Blanco and Travis counties; rises south of Round Mountain in northern part of Blanco County; flows southeasterly 17 miles into Pedernales River (tributary to the Colorado) in the extreme western corner of Travis County just below Hamilton Pool post office. Blanco topographic map.

CYPRESS CREEK.—Cass County; rises near Queen City in northeastern part of county; flows northeasterly 11 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) about three-fourths mile southeast of Spencer Spur. Atlanta topographic map.

CYPRESS CREEK.—Harris County; rises in the northwestern part of county; flows easterly 35 miles to its junction with Spring Creek 3 miles northwest of Humble, then through San Jacinto River to Galveston Bay and thus to Gulf of Mexico. Satsuma, Loretta, Spring, and Weeden topographic maps.

CYPRESS CREEK.—Kendall County; southeast of Sisterdale in central part of county; flows into Guadalupe River.

CYPRESS CREEK.—Kerr and Kendall counties; rises in the northeastern part of Kerr County; flows southeasterly 9 miles through Kerr County, then 3 miles through Kendall County into Guadalupe River at Comfort in western part of Kendall County.

CYPRESS CREEK.—Travis County; small stream in the northwestern part of county; flows southwestward 6 miles to its junction with Colorado River 2 miles southwest of Anderson Mill. Austin topographic map.

DALBY CREEK.—Bowie County; rises about 4 miles north of the southwestern corner of county line; flows southerly 4 miles along county line into Sulphur River (tributary to Red River and thus to the Mississippi) near southwestern corner of county.

DALEY CREEK.—Edwards County; a small intermittent tributary to East Nueces River (thence to the Nueces) in eastern part of county, about one-half mile east of Vance; flows southeasterly 5 miles. Nueces topographic map.

DANIELS CREEK.—Caldwell County; rises southwest of McMalan in the northeastern part of county; flows into Plum Creek (tributary through San Marcos River to the Guadalupe). San Marcos topographic map.

DANIELS CREEK.—Potter County; rises 6 miles northeast of Wilderado near Potter-Oldham county line; flows northeasterly into Tecoyas Creek (tributary through the Canadian to Arkansas River and thus to the Mississippi) 3½ miles south of Field.

DARDEN CANYON CREEK.—Motley County; small stream rising in southeastern part of county and flowing into South Pease River (tributary to Middle Pease River, which discharges into Pease River and thus through Red River to the Mississippi).

DARK HOLLOW.—Eastland County; rises along the Texas Pacific Railway; flows southeasterly 4 miles into Leon River (tributary through Little River to the Brazos) 4 miles southeast of Eastland in central part of County. Eastland topographic map.

DARK VALLEY CREEK.—Palo Pinto County; rises near Jack-Palo Pinto county line; flows southerly 10 miles into Brazos River, 2 miles southeast of Folger in northern part of county. Palo Pinto topographic map.

DARRS CREEK.—Bell County; rises 4 miles south of Salado in southern part of county; flows easterly 17 miles into Little River (tributary to Brazos River) 7 miles southeast of Holland. Taylor topographic map.

DARST CREEK.—Guadalupe County; rises west of Belmont in the southeastern part of county; flows into Guadalupe River; intermittent. San Marcos topographic map.

DAVENPORT BRANCH.—Cooke County; about 4 miles northwest of Marysville in northern part of county; flows to North Fish Creek (tributary to Fish Creek and thus through Red River to the Mississippi); intermittent; very small. Gainesville topographic map.

DAVIS OR ROCK CREEK.—Fannin County; rises about 4 miles southeast of Bonham in central part of county; flows southeasterly 6 miles into North Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi).

DAVIS CREEK.—Newton County; rises about 4 miles south of Newton; flows southeasterly 12 miles into Sabine River.

DAVIS CREEK.—Stephens County; rises north of Yanceyville; flows northerly 5 miles into Brazos River 1 mile north of Young-Stephens county line. Breckenridge topographic map.

DAVIDSON CANYON CREEK.—Dickens County; rises in eastern part; flows southerly 6 miles into South Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

Davidson Creek.—Crosby County; rises 7 miles south of Crosbyton; flows southeasterly 11 miles into White River (which discharges into Brazos River through Salt Fork of the Brazos) in southeastern part of county.

Davidsons Creek.—Burleson County; rises near the northwest boundary line of county; flows southeasterly 35 miles into Yegua Creek (tributary to Brazos River) a mile southeast of Scofield; passes through the town of Caldwell. Gay Hill topographic map.

Dawney Creek.—Bowie County; small stream about 3 miles southwest of Texarkana Junction; flows into Harber Creek (tributary to Sulphur River, which discharges into the Mississippi through Red River). Texarkana topographic map.

Dawson Creek.—Brewster County; a stream 5 miles in length flowing southwesterly into Terlingua Creek (tributary to Rio Grande) 8 miles north of Terlingua Abaja. Terlingua and Chisos Mountains topographic maps.

Dead Horse Creek.—Eastland County; flows northeasterly 7 miles into South Fork of Leon River (tributary to Middle Fork of Leon and Leon rivers, thence through Little River to the Brazos) northwest of Carbon. Eastland topographic map.

Deadhorse Creek.—Hill County; small stream flowing southerly 7 miles to its junction with Aquilla Creek (tributary to Brazos River) in southern part of county 1 mile east of Aquilla. Waco topographic map.

Dead Mans Canyon.—Val Verde County; intermittent stream rising near center of county and flowing southwestward about 12 miles to its junction with Pecos River (tributary to Rio Grande) 2 miles north of Pecos High Bridge (Southern Pacific Lines).

Deadman Creek.—Jones, Shackelford, and Callahan counties; rises 12 miles southeast of Abilene; flows northerly 30 miles into Clear Fork of Brazos River (tributary to the Brazos) 3 miles north of Rising Sun in western part of Jones County near Jones-Shackelford county line. Abilene and Anson topographic maps.

Dead Mans Creek.—Knox County; small stream flowing into North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi) northeast of Gilliland in northern part of county.

Deadmans Creek.—Val Verde County; rises in south central part of county; takes a southeasterly course 6 miles; joins Devils River (tributary to Rio Grande) 8 miles northwest of Comstock.

Deadmans Creek.—Young County; small stream flowing 1½ miles northeasterly into Brazos River southwest of Graham in southern part of county.

Dead Nigger Creek.—Garza County; rises in southwest part of county; flows northerly 3 miles into Double Mountain Fork of Brazos River, thence to the Brazos.

Decker Creek.—Travis County; a stream about 7 miles long flowing southeastward into Gilliland Creek (tributary to Colorado River) three-fourths mile east of Dunlap, in the eastern part of the county. Austin topographic map.

Deep or Asylum Creek.—Callahan and Shackelford counties; rises at Baird; flows northerly 55 miles into Hubbard Creek (tributary through Gonzales Creek to Clear Fork of Brazos River and thus to the Brazos) near McCatherine Mountain southeast of Albany. Albany topographic map.

Deep or Martin Creek.—Mason County; rises 3 miles north of Fly Gap in northeastern part of the county; flows southeastward 15 miles into Llano River (tributary to the Colorado) 1½ miles west of Castell. Mason and Llano topographic maps.

Jack Creek, Tarrant County; rises approximately 3 miles west of Crowley; flows easterly 8 miles into Village Creek (tributary to West Fork of Trinity River, and thus to the Trinity) about 1 mile northeast of Oak Grove. Fort Worth topographic map.

Jack Creek, Medina County; a small intermittent tributary to Seco Creek (thence to the Nueces through Hondo and Frio rivers) in the southwestern part of county; flows southeastward 10 miles.

Jack Creek, Sabine County; small stream flowing into Sandy Creek in southwestern part of county, thence to Devils Ford, Bear Creek, and Ayish Bayou, and thus to Angelina and Neches rivers.

Jack Creek, San Saba, Mason, and Llano counties; a tributary to San Fernando Creek flowing through the northeastern part of Mason County, southwestern part of San Saba County, and northwestern part of Llano County into Llano River and thus to the Colorado; length, 9 miles. Brady, Mason, and Llano topographic maps.

Jack Creek, Scurry County; small stream flowing through the western part of the county into North Fork of Colorado River (tributary to the Colorado).

DELAWARE CREEK.—Culberson County, Tex., and Eddy County, N. Mex.; rises in eastern slope of Delaware Mountains in northwestern corner of Culberson County, Tex.; flows in northeasterly course, crosses New Mexico-Texas State line about 5 miles west of State line, and enters Pecos River (tributary to Rio Grande) 3 miles north of the State line; length, 50 miles. Gaging station near Angeles, 1914–1915.

DELAWARE CREEK.—Burnet County; small stream 4 miles in length flowing into Hamilton Creek (tributary to Colorado River) 3 miles south of Burnet in the south-central part of the county. Burnet topographic map.

DENTON CREEK.—Franklin County; rises about 2 miles south of Mount Vernon; flows northwesterly 6 miles into Big Creek (tributary to White-oak Bayou and thus through Sulphur and Red rivers to the Mississippi.

DENTON CREEK.—Gonzales County; rises northeast of Gonzales; flows southeasterly 10 miles into Peach Creek (tributary to Guadalupe River); intermittent. Flatonia topographic map.

DENTON CREEK.—Gonzales and Dewitt counties; rises in the southeastern part of Gonzales County; flows southeasterly 7 miles through Gonzales County, then 2 miles through Dewitt County into Guadalupe River near Hochheim. Flatonia topographic map.

DENTON CREEK, CLEAR FORK OF.—Gonzales County; south of Possumtrot in northeastern part of county; flows into Denton Creek and thus through Peach Creek to Guadalupe River. Flatonia topographic map.

DENTON CREEK.—Montague, Wise, Denton, Tarrant, and Dallas counties; rises about 3 miles northeast of Bowie in southwestern part of Montague County; flows southeasterly 43 miles into Elm Fork of Trinity River (tributary to Trinity River) about 2 miles west of Carrollton in the northwestern part of Dallas County. Fort Worth, Dallas, and Montague topographic maps.

DERAMADERA CREEK.—Duval County; small stream in southern part of county; flows southeasterly 5 miles; unites with Poquita Creek (Upper Los Olmos Creek) and flows into Gulf of Mexico through Baffins Bay.

DESERT CREEK.—Collin County; rises 1 mile south of Desert; flows southerly 5 miles into Pilot Grove Creek (tributary through Sister Grove Creek to East Fork of Trinity River and thus to the Trinity).

DEVILS FORD CREEK.—Sabine County; rises in southwestern part; flows southwesterly 9 miles into Bear Creek, and thus through Ayish Bayou to Angelina and Neches rivers.

DEVILS GULCH.—Montague County; small intermittent stream flowing into Farmers Creek (tributary to Red River, which discharges into the Mississippi) near Pearson in northern part of county. Montague topographic map.

DEVIL HOLLOW.—Caldwell County; rises in eastern part of county; flows into Sandy Fork of Peach Creek (tributary to Peach Creek and thus to Gualalupe River) northwest of Delhi. Flatonia topographic map.

DEVILS RIVER, EAST BRANCH.—Sutton County; joins Devils Rivers (tributary to Rio Grande) in the southwestern corner of county; approximate length, 20 miles.

DEW BERRY CREEK.—Wharton County; small tributary to West Bernard River (tributary to San Bernard River and thus to Gulf of Mexico) in northern part of county; flows southeasterly.

[illegible]

[illegible] Creek.—[illegible] County; [illegible] southwest of Savannah [illegible] Bear Creek [illegible] Galveston Bay and Gulf of Mexico. [illegible] topographic maps.

[illegible] Creek.—[illegible] County; small [illegible] in eastern part of county; flows southeasterly 3 miles to its junction with [illegible] River [illegible] thence to the Nueces through [illegible] rivers at [illegible]; intermittent. Uvalde topographic map.

Dixon Creek.—[illegible] County; an intermittent stream [illegible] miles long flowing northerly into Canadian River (tributary to Arkansas River and thus to the Mississippi) 2 miles southwest of [illegible] in southern part of county.

Dixon Lake.—(McFarland Lake); Bowie County; about [illegible] miles south of Maud in southern part of county; one of a series of lakes formed by an old channel of Sulphur River (tributary to Red and Mississippi rivers). New Boston topographic map.

Dockum Creek.—Dickens County; rises near Crosby-Dickens county line; flows southeasterly 18 miles into Duck Creek (tributary to Salt Fork of Brazos River and thus to the Brazos) 2 miles east of Spur in southern part of county.

Doctors Creek.—Delta County; rises about 7 miles northwest of Cooper; flows southeasterly 13 miles into South Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi) at the southern boundary of the county.

Dodd Branch.—Coryell County; rises near Lemon Gap 2½ miles east of King in central part of county; flows northeasterly 8 miles into Leon River (tributary to Little River and thus to the Brazos) at Gatesville. Gatesville topographic map.

Doe Creek.—Karnes County; small stream flowing through the southwestern part of the county into Escondido Creek (tributary to San Antonio River and thus to the Guadalupe).

Doe Run.—Washington County; an intermittent stream flowing southeasterly through eastern part of county into Brazos River; length, 10 miles. Navasota and Howth topographic maps.

Dog Creek.—Mason County; a small intermittent stream northeast of Mason in eastern part of county; flows into Willow Creek and thus through Llano River to the Colorado; length, 2 miles. Mason topographic map.

Dogwood Bayou.—San Augustine County; small stream flowing into Ayish Bayou (tributary to Angelina River and thus to the Neches) in central part of the county.

Dogwood Creek.—Austin and Washington counties; small stream flowing into East Fork of Mill Creek (tributary to Mill Creek, and thus to Brazos River) in southern part of Washington and northern part of Austin County near Wesley.

Dogwood Creek.—Fayette County; north of Colony in western part of county; an intermittent tributary through Live Oak and Buckner Creeks to Colorado River; length, 5 miles. Flatonia topographic map.

Dokegood Creek.—Garza County; rises 1 mile southwest of Buenas; flows northeasterly 5 miles into Gholson Creek (tributary through North Fork of Double Mountain Fork of Brazos River to Double Mountain Fork of Brazos River, thence to the Brazos) in northwestern part of county.

Donahoe Creek.—Milam, Bell, and Williamson counties; rises 7 miles south of Salado, near Bell-Williamson county line; flows easterly 22 miles into Little River (tributary to Brazos River) 5 miles southwest of Buckholts. Georgetown and Taylor topographic maps.

Donaho Creek.—Waller County; rises near Howth in northwestern part of county; flows southwesterly 9 miles into Brazos River 5 miles northeast of Chappel Hill.

Donalson Creek.—Lampasas County; rises in southern part of county; flows southeasterly 15 miles into Sulphur Creek (tributary to Lampasas River and thus through Little River to the Brazos) at Lampasas. Lampasas topographic map.

Double Creek.—Bowie County; rises about one-half mile south of Eylan; flows southwesterly 2½ miles into Harber Creek (tributary to Sulphur River and thus through Red River to the Mississippi) in southeastern part of county. Texarkana topographic map.

Double Mountain Fork of Brazos River, North Fork of.—Kent, Garza, Crosby, Lubbock, Hale, Lamb, and Bailey counties; rises in extreme northwestern corner of Bailey County; flows southeasterly 180 miles into Double Mountain Fork of Brazos River (tributary to the Brazos) 15 miles southwest of Clairemont in southwestern part of Kent County; principal tributary to Double Mountain Fork of Brazos River.

Double Mountain Fork of Brazos River.—Haskell, Stonewall, Fisher, Kent, Garza, and Lynn counties; rises 12 miles southeast of Tahoka in southern part of Lynn County; flows easterly 150 miles to its confluence with Salt

Dry Branch—Stephens County: a [illegible] flowing stream 7 miles long [illegible] Creek [illegible] Creek to [illegible] Creek, thence through Clear Fork of Brazos River to the Brazos, 5 miles northwest of Breckenridge. Breckenridge topographic map.

Dry Branch—Shackelford County: a stream flowing northerly 7 miles into [illegible] Creek (tributary to [illegible] Creek and thus through Clear Fork of Brazos River to the Brazos) near Stephens-Shackelford county line east of Albany. Albany topographic map.

Dry Branch—Caldwell County: an intermittent stream rising southeast of [illegible] and flowing into Clear Fork of Plum Creek (tributary through Plum Creek to San Marcos River and thus to the Guadalupe). San Marcos topographic map.

DRY CREEK.—Armstrong County; rises in western part of county; flows southeasterly 10 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi).

DRY CREEK.—Caldwell County; rises near Mendoza in northern part of county; flows southerly 9 miles into Plum Creek (tributary through San Marcos River to the Guadalupe) 2 miles east of Lockhart. Austin and and San Marcos topographic maps.

DRY CREEK.—Coke and Tom Green counties; small stream rising in southern part of Coke County and flowing southward 20 miles into North Concho River (tributary to Concho River and thus to the Colorado) 10 miles northwest of San Angelo in northern part of Tom Green County. Hayrick topographic map.

DRY CREEK.—Coke County; rises east of Hayrick in northeastern part of county; flows 4 miles into Kickapoo Creek and thus to the Colorado; intermittent. Hayrick topographic map.

DRY CREEK.—Concho County; an intermittent stream west of Paint Rock in the northwestern part of county; flows 16 miles into Concho River (tributary to the Colorado). Hayrick and San Angelo topographic maps.

DRY CREEK.—Travis and Bastrop counties; in eastern part of Travis and western part of Bastrop County; small tributary through Wilbarger Creek to Colorado River; length, 5 miles. Bastrop topographic map.

DRY CREEK.—Travis and Bastrop Counties; rises near Creedmoor in the southwestern part of Travis County; flows northeastward through Bastrop County into Colorado River; length, 18 miles. Austin and Bastrop topographic maps.

DRY CREEK.—Caldwell County; rises 2 miles south of Miers; flows southwesterly 9 miles into Plum Creek (tributary through San Marcos River to the Guadalupe) 2 miles east of Cibolo in northeastern part of county. San Marcos topographic map.

DRY CREEK.—Edwards County; a small intermittent tributary to East Nueces River, and thus to Nueces River in the southeastern part of the county about 1½ miles north of Barksdale; length, 5 miles. Nueces topographic map.

DRY CREEK.—Fisher County; an intermittent stream flowing northeasterly 7 miles into Clear Fork of Brazos River (which discharges into the Brazos) 1½ miles southeast of Newman. Roby topographic map.

DRY CREEK.—Hopkins and Wood Counties; rises about 2 miles southeast of Carrolls Prairie in Hopkins County; flows southerly 20 miles into Lake Fork of Sabine River (tributary to Sabine River) about 2 miles south of Quitman in Wood County.

DRY CREEK.—Irion County; small intermittent stream in northern part of the county flowing southeasterly about 13 miles into Middle Concho River (tributary to South Concho River and thus through the Concho to Colorado River), 4½ miles southwest of Arden. Sherwood topographic map.

DRY CREEK.—Llano County; an intermittent stream 4 miles long flowing into Llano River and thus to the Colorado west of Kingsland in the southeastern part of the county. Llano and Burnet topographic maps.

DRY CREEK.—McLennan County; a small stream flowing easterly 6 miles into Bull Hide Creek (tributary to Brazos River) south of Rosenthal in southern part of county. Temple topographic map.

DRY CREEK.—McLennan and Hill counties; rises at Tyson in southern part of Hill County; flows southward 8 miles into Aquilla Creek (tributary to Brazos River) 1 mile east of Gholson; intermittent. Waco topographic map.

DRY CREEK.—Uvalde County; small intermittent stream rising in the northwestern part of county southwest of Montell and flowing ino East Nueces River. Nueces topographic map.

DRY CREEK.—Schleicher and Tom Green counties; rises in northern part of Schleicher County; flows northwesterly 11 miles into South Concho River, 5 miles south of Christoval; intermittent. San Angelo topographic map.

DRY CREEK.—Parker County; rises 3 miles northwest of Peister in northwestern part of county; flows southwesterly 14 miles into Rock Creek (tributary to Brazos River) 3½ miles northwest of Millsap. Weatherford and Palo Pinto topographic maps.

DRY CREEK.—Young County; rises 6 miles east of Graham; flows southwesterly 8 miles into Salt Creek (tributary to Brazos River) near mouth of Salt Creek in southern part of county.

DRY CREEK.—Van Zandt and Smith counties; rises in eastern part of Van Zandt County; flows northeasterly 12 miles into Sabine River (and thus to the Gulf of Mexico) in the extreme northwestern part of Smith County near Silver Lake.

DRY DRAW.—Edwards County; an intermittent tributary to South Llano River (thence to the Colorado through Llano River) northwest of Harris in northern part of county; length, 23 miles. Rock Springs topographic map.

DRY FORK OF GRACES CREEK.—Gregg County; small stream flowing into Graces Creek (tributary to Sabine River) about 1½ miles west of Longview.

DRY GULLY.—Harris County; rises in northwestern part of county 1½ miles northeast of Louetta; flows southeasterly 3 miles into Cypress Creek; intermittent. Louetta topographic map.

DRY RUN.—Gonzales County; a small intermittent stream in northern part of county; flows into Sandy Fork of Peach Creek, thence to Peach Creek (tributary to Guadalupe River). Flatonia topographic map.

DRY VALLEY.—Montague County; rises near New Hope School; flows southerly 7 miles; joins Mallard Creek (tributary to Denton Creek, then through Elm Fork of Trinity River to the Trinity) 1 mile southeast of Dry Valley School; intermittent. Montague topographic map.

DRY BLANKET CREEK.—Brown and Comanche counties; a stream 11 miles long connecting with Blanket Creek (tributary through Pecan Bayou to the Colorado) 2 miles northeast of Zephyr in southeastern part of Brown County. Brownwood topographic map.

DRY BRUSHY CREEK.—Williamson County; rises south of Leander in southwestern part of county; flows southeasterly into Brushy Creek (tributary to San Gabriel River and thus through Little River to the Brazos) 4 miles northwest of Round Rock. Georgetown topographic map.

DRY BRUSHY CREEK.—Williamson County; rises near corner of Travis, Bastrop, and Williamson counties; flows northeasterly 11 miles into Boggy Creek (tributary to San Gabriel River through Brushy Creek, and thus through Little River to the Brazos) southeast of Taylor. Austin and Georgetown topographic maps.

DRY CALIFORNIA CREEK.—Jones and Fisher counties; an intermittent stream rising 2 miles southeast of Taopi in eastern part of Fisher County and flowing northeastward 13 miles to a point 7 miles north of Neinda in northwestern part of Jones County where it enters California Creek and thus through Clear Fork of Brazos River to the Brazos. Roby topographic map.

DRY COMAL CREEK.—Comal County; headwater stream uniting with Comal River (tributary to Guadalupe River) in New Braunfels in southeastern part of county; intermittent.

DRY CYPRESS CREEK.—Wood, Franklin, and Camp counties; rises in southeastern part of Wood County; flows northeasterly 13 miles into Big Cypress Creek (tributary to Caddo Lake, which discharges into the Mississippi through Red River) at the northwestern boundary of Camp County.

DRY DEVILS RIVER.—Val Verde County; rises in eastern part of county; flows southwesterly about 10 miles into Devils River (tributary to Rio Grande); intermittent.

DRY DUCK CREEK.—Kent County; a southeasterly flowing stream joining Salt Fork of Brazos River (tributary to the Brazos) 7 miles southwest of Jayton; length, 7 miles.

DRY ELM CREEK.—Cooke County; rises about 4 miles southwest of Marysville in western part of county; flows southeasterly 12 miles into Elm Fork of Trinity River (tributary to the Trinity) about 2 miles southwest of Lindsay. Gainesville topographic map.

DRY FORK OF ARMSTRONG CREEK.—Erath County; a small intermittent stream flowing southward 4 miles into Armstrong Creek (tributary through Leon River to Little River and thus to the Brazos) west of Lingleville in western part of county. Stephenville topographic map.

DRY FORK.—Gonzales County; small intermittent stream flowing into Smith Creek (tributary to San Marcos River) 3 miles northwest of Gonzales. Flatonia topographic map.

DRY FRIO RIVER.—Uvalde County; intermittent stream; rises near Uvalde-Real county line; flows southeastward 25 miles to its junction with Frio River (tributary to Nueces River) one mile southwest of Knippa. Uvalde topographic map.

DRY HOLLOW CREEK.—Gillespie County; rises in eastern part of county; flows 3 miles parallel to eastern county line into North Grape Creek and thus to the Pedernales and Colorado rivers. Fredericksburg topographic map.

DRY LIPAN CREEK.—Tom Green County; an intermittent stream; rises east of San Angelo in northeastern part of county; flows into Lipan Creek (tributary to Concho River and thus to the Colorado); length, 20 miles. San Angelo topographic map.

DRY SYCAMORE CREEK.—Edwards and Kinney counties; small intermittent tributary to Sycamore Creek (thence to Nueces River through Silver Lake and West Nueces River) in southern part of Edwards and northeastern part of Kinney County; flows southerly 12 miles. Nueces topographic map.

DUBBS LAKE.—Donley County; about 2½ miles northwest of Clarendon; outlet, when overflowing, Kelley Creek (tributary to Salt Fork of Red River, and thus through Prairie Dog Town Fork of the Red to Red River, thence to the Mississippi); area, about one-half square mile.

DUCK CREEK.—Clay County; a stream 9½ miles long flowing southerly to a point in the western part of county, where it enters little Wichita River (tributary to Red River, which discharges into the Mississippi).

DUCK CREEK.—Cooke and Denton counties; rises about 5 miles west of Valley View in Cooke County; flows southerly 14 miles into Clear Creek (tributary to Elm Fork of Trinity River, thence to the Trinity) about 1½ miles south of Huling in northern part of Denton County. Gainesville topographic map.

DUCK CREEK.—Concho County; rises southeast of Paint Rock in northeastern part of county; flows 20 miles into Concho River (tributary to the Colorado). Ballinger and Eden topographic maps.

DUCK CREEK.—Dallas and Kaufman counties; rises about 2 miles northeast of Richardson in northern part of Dallas County; flows southeasterly 18 miles into East Fork of Trinity River approximately 3 miles above the Texas Pacific Railway crossing in northwestern corner of Kaufman County. Dallas and Barnes Bridge topographic maps.

DUCK CREEK.—Kent and Dickens counties; rises 6 miles northwest of Dickens in southwestern part of Dickens County; flows southeasterly 40 miles into Salt Fork of Brazos River (tributary to the Brazos) 6 miles northeast of Clairemont in central part of Kent County.

DUCK CREEK.—Grayson County; rises in northern part of the town of Denison; flows northerly 3 miles into Red River; intermittent. Denison topographic map.

DUCK CREEK.—Limestone and Robertson counties; rises near Kosse in southern part of Limestone County; flows southeasterly 25 miles into Navasota River (tributary to Brazos River) southeast of lake in eastern part of Robertson County.

DUCK CREEK.—Smith County; flows northeasterly 9 miles into Sabine River about 2 miles east of point where International Great Northern Railroad crosses Sabine River in northwestern part of county.

DUCK CREEK.—Van Zandt and Hunt counties; rises in northwest corner of Van Zandt County; flows northerly 3 miles into South Fork of Sabine River (thence to Sabine River) in southeastern part of Hunt County.

DUDLEY CREEK.—Roberts County; rises 14 miles west of Miami; flows northerly 20 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 26 miles northwest of Miami in northern part of county.

DUDLEYS CREEK.—Haskell County; a stream flowing southeastward 7 miles into Paint Creek (which discharges into California Creek and thus through Clear Fork of Brazos River to the Brazos) in southern part of county.

DUFFAU CREEK.—Bosque and Erath counties; rises about 3 miles northwest of Johnsville; flows southeasterly 20 miles into Bosque River (tributary to Brazos River) a mile southwest of Iredell in western part of Bosque County. Stephenville, Granbury, and Meridian topographic maps.

DUFFORD CREEK.—Harrison County; in southwestern part of county; flows southeasterly 11 miles into Sabine River.

DUGAN CREEK.—Wilbarger County; rises in northern part; flows northeasterly 7 miles into Pease River (tributary through Red River to the Mississippi) about 1½ miles northeast of Kingola.

DUGOUT DRAW.—Brewster County; rises 5 miles northwest of Boquillas; joins Tornillo Creek (tributary to Rio Grande) 1 mile north of Boquillas. Chisos Mountains topographic map.

DUNCAN CREEK.—Comanche County; rises 3 miles northwest of the town of Comanche is central part of county; flows northeasterly 10 miles into Copperas Creek (which discharges into the Leon and thus through Little River to the Brazos) 7 miles northeast of Comanche. Brownwood topographic map.

DUNCAN CREEK.—Fannin County; rises in northeastern part of county; flows southeastward 3½ miles into Bois d'Arc Creek (tributary to Red River and thus to the Mississippi).

DUNN CREEK.—Hunt County; small stream flowing into Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of Sabine River) in southeastern part of county.

DURAZNO BAYOU.—Nacogdoches County; flows southwesterly 5 miles into Angelina River (tributary to Neches River) in the southeastern part of county.

DURAZNO CREEK.—Angelina County; rises in northern part of county; flows northeasterly 8 miles into Angelina River (tributary to the Neches).

DUTCH BRANCH.—Tarrant County; small stream flowing into Clear Fork of Trinity River (tributary to West Fork of the Trinity and thus to Trinity River) south of Ben Brook in southwestern part of county. Weatherford and Fort Worth topographic maps.

DUTCHMAN BRANCH.—King County; rises in eastern part; flows northerly 4 miles into South Wichita River, thence to Wichita River and thus through Red River to the Mississippi.

DUTCHMAN CREEK.—Motley County; rises about 1 mile east of Lyman in southwestern part of county; flows southeastward 6 miles into Walnut Creek (tributary to South Pease River and thus through Middle Pease to Pease River, thence through Red River to the Mississippi).

DUTYS CREEK.—Fayette County; tributary to Colorado River in southeastern part of county; length, 7 miles.

DYE CREEK.—Montague County; rises near Blue Mound; flows southeasterly 7 miles into Clear Creek (tributary to Elm Fork of Trinity River and thus to the Trinity) one-half mile west of Gladys in southeastern part of county. Montague topographic map.

EAGLE CREEK.—Coryell County; a small intermittent stream in northern part of county flowing southeasterly 7 miles into Leon River (tributary through Little River to the Brazos) 5 miles south of Jonesborough. Meridian topographic Map.

EAGLE CREEK.—Nolan County; rises west of Blackwell in southern part of county; flows 12 miles into Oak Creek and thus to the Colorado. Sweetwater topographic map.

EAGLE CREEK.—Palo Pinto County; rises 4 miles east of Metcalf Gap in central part of county; flows northerly 11 miles into Brazos River 1½ miles west of Kyle Mountain and 4½ miles northwest of Palo Pinto. Palo Pinto topographic Map.

EAGLE CREEK.—Wilson County; rises north of Saspamco in Western part of county; empties into Calaveras Creek (tributary to San Antonio River and thus to the Guadalupe).

EAGLE HOLLOW.—Donley County; rises in east central part; takes northeastward course 3½ miles into Salt Fork of Red River (tributary through Prairie Dog Town Fork of the Red to Red River and thus to the Mississippi).

EAST BRANCH.—Fayette County; small intermittent tributary to Cedar Creek thence to Colorado River in northwestern part of county. Flatonia topographic map.

EAST CREEK.—Walker County; small stream in southern part of county; flows southwesterly 10 miles into West San Jacinto River, thence to San Jacinto River, Galveston Bay and Gulf of Mexico.

EAST CREEK.—Franklin County; small stream in northwestern part of county; flows southeasterly 5 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

EAST ALAMOSA CREEK.—Oldham County; rises 7 miles north of Vega; flows northerly 13 miles to its union with Middle Alamosa Creek (tributary through the Canadian to Arkansas River and thus to the Mississippi) 4 miles west of Cheyenne, in northeastern part of county; intermittent.

EAST BAY BAYOU.—Chambers County; tidal stream in southeastern part of county formed by union of Elm and Mud bayous; flows southwesterly into East Galveston Bay and thence to Gulf of Mexico.

East Belknap Creek.—Montague County; rises about 6 miles east of Stoneburg in western part of county; flows northwesterly 11 miles into Belknap Creek (tributary to Red River and thus to the Mississippi) 3 miles southwest of Belcherville. Montague topographic map.

East Bitter Creek.—Donley and Hall counties; rises in southern part of Donley County; flows southwesterly 6½ miles into Bitter Creek (tributary to Mulberry Creek, thence through Prarie Dog Town Fork of Red River to the Red and thus to Mississippi) in northwestern part of Hall County.

East Bosque River.—Bosque and Erath counties; rises near Flag Creek Gap in southeastern corner of Erath County; flows southeasterly 15 miles into Bosque River (tributary to the Brazos) about 2 miles south of Pilot Knob in the western part of Bosque County. Meridian and Granbury topographic maps.

East Buffalo Creek.—Johnson County; rises 2½ miles southeast of Joshua; flows southerly 9 miles to a point 1 mile south of Cleburne, where it unites with West Buffalo Creek and passes to the Brazos through Buffalo Creek and Nolands River. Cleburne topographic map.

East Buffalo Creek.—Lipscomb County; rises 11 miles southwest of Lipscomb; flows northerly 8 miles into Wolf Creek (tributary to North Fork of Canadian River and thus through the Canadian and Arkansas to Mississippi River) 6 miles west of Lipscomb in western part of county.

East Brushy Creek.—Delta County; rises 5 miles east of Cooper; flows southeasterly 5 miles to its junction with West Brushy Creek to form Brushy Creek (tributary to South Sulphur River and thus through Sulphur River and the Red to Mississippi River).

East China Creek.—Fisher County; an intermittent stream in southeastern part of county; flows northeasterly 5 miles into China Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) west of Newman. Roby topographic map.

East Copperas Creek.—Kimble County; a small stream 4 miles in length in the northwestern part of county flowing through Copperas Creek into North Llano River and thus through the Llano to Colorado River. Fort McKavett topographic map.

East Cottonwood Creek.—Fisher County; an intermittent stream flowing northerly 9 miles into Cottonwood Creek (tributary through Clear Fork of Brazos River to the Brazos) southwest of Roby. Roby topographic map.

East Fork of Trinity River (Bois d'Arc River).—Grayson, Collin, Rockwall, Dallas, and Kaufman counties; rises about 2 miles west of Howe in Grayson County; flows southerly 78 miles into Trinity River about 2 miles above the crossing of the Texas Midland Railway in southwestern part of Kaufman County. Dallas, Barnes Bridge, and Rockwall topographic maps.

East Grindstone Creek.—Parker County; rises 2 miles southwest of Lambert in western part of county; flows southerly 8 miles into Grindstone Creek (tributary to Brazos River) 2 miles southwest of Brock. Weatherford topographic map.

East Jones Creek.—Montague County; a stream flowing into Jones Creek (tributary to Big Sandy Creek, thence through West Fork of Trinity River to the Trinity) south of the town of Bowie in southwestern part of county; intermittent. Montague topographic map.

East Kickapoo Creek.—Concho County; a stream flowing to the south of Paint Rock in the western part of county to its junction with Kickapoo Creek (tributary to Concho River and thus to the Colorado); length, 13 miles. Eden topographic map.

East Kickapoo Creek.—Runnels County; rises to the northwest of Maverick in western part of Runnels County; flows into Kickapoo Creek (tributary to Colorado River); length, 7 miles. Hayrick topographic map.

East Little Postoak Creek.—Archer County; rises in eastern part of county; flows northerly 6½ miles to its junction with West Little Postoak Creek to form Little Postoak Creek (tributary to Postoak Creek and thus through Little Wichita and Red Rivers to the Mississippi), about 11 miles northeast of Archer City.

East Mountain Creek.—Cooke County; an intermittent stream 5 miles long flowing northerly into Mountain Creek (tributary to Red River and thus to the Mississippi) in northwestern part of county. Gainesville topographic map.

East Navidad River.—Fayette County; rises near Black Jack Springs near central part of county; flows southerly 13 miles into Navidad River (tributary to Lavaca River, and thence to Gulf of Mexico through Matagorda Bay) 3 miles southeast of Schulenburg.

East Poor Hollow.—Schleicher County; an intermittent stream 11 miles long flowing through the eastern part of county, northwest of Fort McKavett, to its junction with Poor Hollow and thus through Poor Valley and North Valley to the San Saba (tributary to Colorado River). Fort McKavett and San Angelo topographic maps.

East Prairie Branch.—Montague County; joins Prairie Branch (tributary through Big Sandy Creek to West Fork of Trinity River, and thus to the Trinity) west of Bowie, in the southwestern part of county; intermittent. Montague topographic map.

East Salt Creek.—Collingsworth and Childress counties; rises about 1 mile north of south boundary of Collingsworth County; flows southeastward 11 miles into Salt Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi), in northern part of Childress County.

East Sanches Creek.—Parker County; rises 1 mile south of Weatherford, in central part of county; flows southerly 7 miles into Sanches Creek (tributary to Brazos River) a mile north of Balch. Weatherford topographic map.

East San Jacinto River.—Walker, San Jacinto, Liberty, Montgomery, and Harris counties; rises in southwestern part of Walker County; flows southeasterly, southerly, and southwesterly 3 miles through Walker County, 22 miles through San Jacinto, 13 miles through Liberty County, 8 miles through Montgomery County, then 4 miles through Harris County into San Jacinto River (tributary to Galveston Bay and Gulf of Mexico).

East Shawnee Creek.—Rusk County; rises in southeastern part of county; flows southwesterly, then westerly into Angelina River (tributary to Neches River), in the southwestern corner of county; length, 22 miles.

Ecleto Creek.—Guadalupe, Wilson, and Karnes counties; rises in southern part of Guadalupe County; flows southeasterly 8 miles through Guadalupe County, 18 miles through Wilson County, then 25 miles through Karnes County, where it joins San Antonio River (tributary to the Guadalupe) near the town of Runge, in eastern part of Karnes County.

Edd Creek.—Bowie County; rises 3 miles southeast of Dalby Springs; flows easterly 4 miles into Bassett Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 1½ miles northwest of Bassett, in southwestern part of county.

Ednas Creek.—Baylor County; an eastward-flowing stream 5 miles long joining Brazos River 5 miles west of Seymour, in western part of county.

EDWARDS BRANCH.—Stephens County; a small stream flowing southeasterly 4 miles into Hubbard Creek (tributary to Gonzales Creek, thence through Clear Fork of Brazos River to the Brazos), in northwestern part of county. Albany topographic map.

EDWARDS CREEK.—Polk and Liberty counties; joins Menard Creek (tributary to Trinity River) in northern part of Liberty County near Polk-Liberty county line.

EIGHTMILE CREEK.—Harrison County; rises about 3 miles northeast of Marshall; flows southerly 19 miles into Sabine River at the intersection of the Harrison-Panola county line.

ELBA CREEK.—Grayson County; rises about 6 miles west of Sherman, in central part of county; flows northwesterly 7 miles into Beaver Creek (tributary to Mineral Creek, thence to Red River and thus to the Mississippi) about 3 miles east of Sadler. Denison topographic map.

ELBOW LAKE.—Bowie County; about 5½ miles southeast of Maud in southern part of county; outlet, Sulphur River (tributary to Red River and thus to the Mississippi); formerly a channel of Sulphur River. New Boston topographic map.

ELIZABETH CREEK.—Tarrant and Denton counties; rises near Blue Mound in northwestern part of Tarrant County; flows northeasterly 10 miles into Denton Creek (tributary to Elm Fork of Trinity River and thus to the Trinity) about 2 miles north of Roanoke in southwestern part of Denton County.

ELKHART CREEK.—Anderson and Houston counties; rises near the Houston-Anderson County line in Anderson County; flows southwesterly 16 miles into Trinity River in northwestern part of Houston County.

ELLIOTT CANYON CREEK.—Motley County; small stream in southeastern part of county flowing into South Pease River (tributary through Middle Pease River and thus through Red River to the Mississippi).

ELLIOTT CREEK.—Lampasas County; a stream 10 miles long in western part of the county; flows into Colorado River. San Saba topographic map.

ELLIOTT CREEK.—Bowie County; rises about 2 miles south of Hooks; flows southeasterly 15 miles into Sulphur River (tributary to Red River and thus to the Mississippi) about 5 miles west of Draper in southeastern part of county. New Boston and Texarkana topographic maps.

ELLIOTT CREEK.—Cass County; rises about 3 miles northeast of Marietta in northwestern part of county; flows northwesterly 3½ miles into Mill Creek (tributary to Sulphur River and thus through Red River to the Mississippi). Daingerfield topographic map.

ELLISON BRANCH.—Eastland County; rises 2 miles northeast of Gorman; flows northeasterly 4 miles into Leon River (tributary to the Brazos through Little River). Eastland topographic map.

ELM BAYOU.—Chambers County; a tidal stream rising in southeastern part of county; flows southerly 9 miles to its junction with Mud Bayou (tributary to East Bay Bayou and thus to East Galveston Bay thence to Gulf of Mexico).

ELM BRANCH.—Palo Pinto County; rises near Erath-Palo Pinto County line; flows northeasterly 4 miles into Buck Creek (tributary to Palo Pinto Creek and thus to Brazos River) 2 miles northeast of Jacobs Wells. Palo Pinto topographic map.

ELM OR CHIQUIHUITILLA CREEK.—Atascosa County; small tributary of Atascosa River (thence to Frio and Nueces rivers) in the southeastern part of the county; flows southwesterly; length, 12 miles.

Elm Creek.—Atascosa County; a small tributary to Sesteadero Creek (thence to Nueces River through Atascosa and Frio rivers) in the northwestern part of county; flows northeastward 3 miles.

Elm Creek.—Bastrop County; small intermittent stream in western part of county; flows northwesterly 7 miles to its junction with Walnut Creek (tributary to Colorado River) 2 miles northwest of Old Redrock. Flatonia topographic map.

Elm Creek.—Bee County; small tributary to Aransas River (thence to Copano Bay and Gulf of Mexico) in the southwestern part of county; flows easterly 7 miles.

Elm Creek.—Bexar County; flows easterly 15 miles into Medina River (tributary to San Antonio River and thus to the Guadalupe) in southwestern part of county. San Antonio topographic map.

Elm Creek.—Brown County; a small stream flowing south of Byrds store in northwestern part of county; tributary through Pecan Bayou to Colorado River; length, 7 miles. Coleman topographic map.

Elm Creek.—Brown County; small stream northwest of Clio in the northern part of the county; flows northwestward 6 miles into Hog Creek (tributary to Pecan Bayou and thus to the Colorado). Brownwood topographic map.

Elm Creek.—Caldwell and Hays counties; rises 3 miles south of Creedmoor in southeastern corner of Hays County; flows 4 miles through Hays County, then 7 miles through Caldwell County to its junction with Plum Creek (tributary through San Marcos River to the Guadalupe) 3 miles north of Lockhart.

Elm Creek.—Collin County; rises 2 miles north of Farmersville; flows southwesterly 12 miles into Sister Grove Creek (which discharges into Trinity River through the East Fork of the Trinity) about 2 miles north of Clear Lake.

Elm Creek.—Coleman County; a stream flowing to the southwest of Valera, in the southwestern part of the county, into Colorado River; length, 26 miles Ballinger topographic map.

Elm Creek.—Duval and McMullen counties; rises in northern part of Duval County; flows northwestward 10 miles through Duval County, then 16 miles through McMullen County into Nueces River.

Elm Creek.—Eastland County; rises 1½ miles northeast of Rising Star in southern part of county; flows northeasterly 10 miles into Sabanna River (tributary through Leon and Little rivers to the Brazos) 4 miles southwest of Jewell. Eastland topographic map.

Elm Creek.—Ellis County; small stream flowing into South Fork of Pecan Creek (tributary to Pecan and Richland creeks, thence to Trinity River) in the southwestern part of the county.

Elm Creek.—Fayette County; southwest of Cistern in southwestern part of county; intermittent tributary to Peach Creek (thence to Guadalupe River). Flatonia topographic map.

Elm Creek.—Hopkins and Rains counties; rises about 4 miles southeast of Blackjack Grove in Hopkins County; flows southeasterly 14 miles into Lake Fork of Sabine River (tributary to the Sabine) about 4 miles northeast of Emory in Rains County.

Elm Creek.—Jones, Nolan, and Taylor counties; rises 1 mile south of Dora in eastern part of Nolan County; flows northeasterly 60 miles, passes near Buffalo Gap and Abilene, into Clear Fork of Brazos River (tributary to the Brazos) 1½ miles north of Phantom Hill in southeastern part of Jones County. Sweetwater, Abilene, and Anson topographic maps.

ELM CREEK.—Kinney County; rises 10 miles northeast of Brackett; flows southwesterly 32 miles into Rio Grande and thus to Gulf of Mexico; intermittent. Brackett topographic map.

ELM CREEK.—Kinney, Maverick, Zavalla, and Dimmit counties; rises in the central part of Kinney County about 6 miles northeast of Brackettville at an approximate elevation of 1,500 feet above sea level; flows southeasterly 24 miles through Kinney County, 21 miles through northeastern part of Maverick County, 24 miles through the southwestern part of Zavalla County, then 11 miles through the northwestern part of Dimmit County into Nueces River in the northwestern part of Dimmit County, about 10 miles north of Carrizo Springs. Brackett topographic map.

ELM CREEK.—Lee County; rises near Hills on Houston & Texas Central Railroad; flows northeastward 8 miles into Third Yegua Creek (tributary through Second Yegua Creek to Yegua Creek and thus to the Brazos) near Lincoln on San Antonio & Aransas Pass Railway in central part of county.

ELM CREEK.—Mason and Llano counties; an intermittent stream flowing along the boundary of Mason and Llano counties 11 miles; joins the Llano (tributary to Colorado River) 2 miles east of Castell. Mason and Llano topographic maps.

ELM CREEK.—McCulloch County; a stream 14 miles long rising southeast of Pueblo in the northern part of the county and flowing into Colorado River. Brady topographic map.

ELM CREEK.—McCulloch County; rises in northwestern part of county 6 miles northeast of Salt Gap; flows northeasterly 9 miles into Colorado River; intermittent. Eden and Brady topographic maps.

ELM CREEK.—McLennan County; small intermittent stream in northern part of county flowing southerly 4 miles into Aquilla Creek (tributary to Brazos River) southwest of Ross. Waco topographic map.

ELM CREEK.—McMullen County; a small tributary to Willow Creek (which discharges into Nueces River through Frio River) in the northwestern part of county; length, 3 miles.

ELM CREEK.—Menard County; a small stream southeast of Menard in the eastern part of county; flows 7 miles into San Saba River and thus to the Colorado.

ELM CREEK.—Robertson County; a stream 1½ miles long flowing northwesterly into Peach Creek (tributary through Campbells Creek to Little Brazos River and thus to the Brazos) south of Benchley.

ELM CREEK.—Taylor and Runnels counties; rises 1 mile south of Guion in the southern part of Taylor County; flows southerly 4 miles through Taylor County, then 28 miles through Runnels County to its junction with Colorado River one-half mile below Ballinger in the southern part of Runnels County. Abilene and Ballinger topographic maps.

ELM CREEK.—Travis County; small intermittent stream rising 2½ miles above Hornsby; flows southeasterly 7 miles into Gilleland Creek (tributary to Colorado River) about a mile southeast of Dunlap. Austin topographic map.

ELM CREEK.—Travis County; rises near Elgin in eastern part of county; flows southwestward 7 miles into Wilbarger Creek and thus to Colorado River. Bastrop topographic map.

ELM CREEK.—Young and Throckmorton counties; rises 8 miles west of Williamsburg in northern part of Throckmorton County; flows eastward 34 miles into Brazos River 3 miles east of Proffitt in western part of Young County.

ELM CREEK.—Zavalla County; small intermittent tributary to Liveoak Creek (thence to Nueces River through Yo-lo-digo Creek, Leona and Frio rivers) in northeastern part of the county. Uvalde topographic map.

ELM FORK OF TRINITY RIVER (ELM OR BIG ELM CREEK).—Montague, Cooke, Denton, and Dallas counties; rises about 1 mile northwest of Saint Jo in eastern part of Montague County; flows southeasterly 85 miles to its junction with West Fork of Trinity River forming Trinity River about 5 miles northwest of Dallas. Montague and Dallas topographic maps.

ELM FORK OF OLIVERS CREEK.—Denton County; a short stream flowing into Olivers Creek (tributary to Denton Creek and thus through Elm Fork of the Trinity to Trinity River) in the southwestern part of the county.

ELM FORK OF RED RIVER.—Wheeler and Collingsworth counties, Tex., and Beckham, Harmon, and Greer counties, Okla., rises about 4 miles northwest of Ramsdell in southwestern part of Wheeler County; flows southeasterly 30 miles to its intersection with the Texas-Oklahoma boundary line about 5 miles east of Aberdeen in eastern part of Collingsworth County, then southeasterly to its junction with North Fork of Red River (tributary to Red River and thus to the Mississippi) in southeastern part of Greer County, Okla.

ELM FORK OF TEHUACANA CREEK.—Limestone and Freestone counties; rises about 3 miles northeast of Mexia in Limestone County; flows northeasterly 4 miles into Tehuacana Creek (tributary to Trinity River) in Freestone County about 3 miles south of Tehuacana.

ELM GROVE CREEK.—Grimes County; rises in southern part of county; flows southerly from West Academy into Beasom Creek (tributary to Brazos River) 2 miles southeast of Linn Grove. Navasota topographic map.

ELM MOTT BRANCH.—Hill County; a short stream in the extreme western part of the county; flows southerly 2½ miles into Brazos River opposite Bee Mountain. Granbury topographic map.

ELMIR BRANCH.—Erath County; a southerly flowing stream 4 miles long joining North Paluxy Creek (tributary to Paluxy Creek and thus to Brazos River) 2 miles west of Bluff Dale in northern part of county. Stephenville topographic map.

EL MORO CREEK.—Dimmit County; intermittent stream in central part of county; flows northeastward 22 miles to its junction with Nueces River 4 miles southeast of Asherton.

EL SARCO RIVER.—Goliad and Refugio counties; rises in southern part of Goliad County; flows southeastward and southwestward 10 miles to its junction with Blanco Creek, then southeastward 3 miles along the boundary of Goliad and Bee counties, thence southeastward 9 miles to its junction with Medio Creek, below which the stream is known as Rio de la Mission (tributary to Gulf of Mexico through Copano Bay).

EMBERSON LAKE.—Lamar County; near Razor in northern part of county; outlet, Red River (tributary to the Mississippi); formerly an old channel of Red River.

ENDORA LAKE.—Dallam County; 5 miles south of Oklahoma-Texas boundary line in northern part of county; outlet, Rabbit Ear Creek.

ENNIS, PARADISE, OR POOL CREEK.—Wilbarger County; rises in southwestern part of county; flows northeasterly 22 miles into Pease River (tributary to Red River and thus to the Mississippi) about 3 miles east of Vernon.

ENNIS CREEK.—Scurry County; rises 5 miles east of Fullerville in northeastern part of county; flows southeasterly 16 miles into Rough Creek (tributary through Double Mountain Fork of Brazos River to the Brazos).

Epps Creek.—Kimble and Sutton counties; small stream flowing through the northwestern part of Kimble and northeastern part of Sutton counties into Copperas Creek (tributary to North Llano River and thus through the Llano to Colorado River); length, 11 miles. Fort McKavett topographic map.

Escondido Creek.—Karnes County; near Karnes City in southern part of county; flows easterly 9 miles into San Antonio River and thus to the Guadalupe.

Escondido Creek.—Bexar County; rises 10 miles northeast of San Antonio; flows southeasterly into Cibolo Creek (tributary to San Antonio River), then to Guadalupe River and thus to Gulf of Mexico; intermittent. San Antonio topographic map.

Esparanzos Creek.—La Salle and McMullen counties; rises in the northeastern part of La Salle County; flows southeastward 8 miles through La Salle County, then 9 miles through McMullen County into Frio River (tributary to Nueces River) about 12 miles above Tilden.

Espada Creek.—Webb County; an intermittent stream rising in the western part of county and flowing southward approximately 10 miles into Rio Grande.

Espio Creek.—Dimmit and Lasalle counties; rises in northeastern part of Dimmit County; flows southeastward to its junction with Nueces River in La Salle County; length, 12 miles.

Ettas Creek.—Borden and Scurry counties; rises in the northeastern corner of Borden County; flows southeastward about 22 miles into North Fork of Colorado River (and thus to the Colorado) north of Knapp in the southwestern part of Scurry County.

Evans Creek.—Val Verde County; small stream rising about 4 miles northeast of Comstock and taking a southeasterly course to its junction with Devils River (tributary to Rio Grande) near the town of Devils River; approximate length, 16 miles.

Everett or Thickety Creek.—Jasper and Newton counties; rises about 5 miles southeast of the town of Jasper in Jasper County; flows southeasterly 18 miles; enters White Oak Creek (tributary to Big Crow Creek and thus to Sabine River) in central part of Newton County.

Ewings Lakes.—Dallam County; a series of small lakes in northern part of county; outlet, Rabbit Ear Creek.

Fairchild Creek.—Fort Bend County; a stream flowing southeasterly 10 miles into Big Creek (tributary to Brazos River) south of the town of Richmond.

Fairmounts Creek.—Borden County; small tributary to Colorado River in the southeastern part of county; length, 4 miles.

Fall Creek.—Blanco and Travis counties; small stream rising near Shovel Mountain in the northeastern part of Blanco County; flows southeasterly 9 miles into Pedernales River (tributary to Colorado River) at Turners Crossing. Blanco topographic map.

Fall Creek.—Bosque and Hamilton counties; rises near Fairy; flows northeasterly 7 miles into Bosque River (tributary to the Brazos) 4 miles southwest of Iredell in western part of Bosque County. Meridian topographic map.

Fall Creek.—Hood County; rises 3 miles west of Cresson in northeastern part of county; flows southerly 12 miles into Brazos River at North Arm of "DeCordova Bend." Weatherford and Granbury topographic maps.

Fall Creek.—Kerr and Gillespie counties; rises north of Ingram; small stream flowing into Johnson Creek and thus to the Guadalupe. Kerrville topographic map.

FALL CREEK.—Kimble County; small stream flowing northward 10 miles to its junction with East Fork of James River (tributary to James and Llano rivers, and thus to the Colorado), in eastern part of the county. Kerrville topographic map.

FALL CREEK.—Llano and San Saba counties; rises 3 miles northeast of Wilberns Glen; flows easterly 13½ miles along San Saba-Llano county line into Colorado River; partially intermittent. Llano and Burnet topographic maps.

FALLS CREEK.—Garza County; rises 2 miles northwest of Dugger; flows easterly 6 miles into North Fork of Double Mountain Fork of Brazos River (tributary through Double Mountain Fork of the Brazos to Brazos River) 6 miles northeast of Post in central part of county.

FANNING CREEK.—Hunt County; small tributary to Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of the Sabine) in southeastern part of county.

FARMERS BRANCH.—Dallas County; rises about 3 miles south of Frankford; northwestern part of county; flows southwesterly 7 miles into Elm Fork of Trinity River (tributary to Trinity River) 2½ miles southwest of the town of Farmers Branch. Dallas topographic map.

FARMERS CREEK.—Montague County; rises about 3 miles west of Saint Jo in eastern part of county; flows northerly 25 miles into Red River (tributary to the Mississippi) about 2½ miles southeast of Old Spanish Fort. Montague topographic map.

FARMERS CREEK.—Wilbarger and Wichita counties; rises north of Harrold in northeastern part of Wilbarger County; flows easterly 3 miles into Red River (tributary to the Mississippi) in northwestern part of Wichita County.

FARRERS CREEK.—King County; rises in northern part of county; flows easterly 14 miles into Middle Fork of Wichita River (tributary through North Wichita River to the Wichita and thus through Red River to the Mississippi) in the northeastern part of the county.

FARRIS CREEK.—Bosque County; a small intermittent stream flowing southerly 3 miles into Steele Creek (tributary of Brazos River) northwest of Morgan in northern part of county. Granbury topographic map.

FAULKEY GULLY.—Harris County; rises in northwestern part of county 2 miles northwest of Neidorff School; flows southeasterly 6½ miles into Cypress Creek (tributary to Spring Creek, thence to San Jacinto River and thus through Galveston Bay to Gulf of Mexico); intermittent. Rose Hill, Louetta, and Satsuma topographic maps.

FERRIS FORK OF CEDAR CREEK.—Van Zandt and Kaufman counties; rises near Cobbs in northeastern part of Kaufman County; flows circuitously southeastward through Kaufman and Van Zandt counties, then southwesterly into Cedar Creek (tributary to Trinity River) in the southeastern part of Kaufman County; length, 27 miles.

FIELD CREEK.—Llano and San Saba counties; near the town of Field Creek; small stream 5 miles in length, flowing through San Fernando Creek into the Llano (and thus to Colorado River) in the northwestern part of Llano County. Llano topographic map.

FIELDER BRANCH.—King County; rises in northern part of county; flows into Middle Fork of Wichita River (tributary through North Wichita River to Wichita and thus through Red River to the Mississippi).

FIELDERS CREEK.—Val Verde County; an intermittent stream rising in northwestern part of county near county line between Crocket and Val Verde counties, flowing southwesterly 12 miles to its junction with Howards Creek (tributary to Pecos River and thus to Rio Grande) northwest of Pandale.

FIFTH CREEK.—Lipscomb County; an intermittent stream 7 miles long flowing into Wolf Creek (tributary through North Fork of Canadian to Canadian River and thus through the Arkansas to Mississippi River) 2 miles west of Lipscomb in central part of county.

FIRST CREEK.—Lipscomb County; an intermittent stream flowing southeasterly 7 miles into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through the Arkansas to the Mississippi) 5 miles northeast of Valley Park, in western part of county.

FIRST ELM CREEK.—Lasalle County; small stream in western part of county; flows southeasterly to its junction with Las Raices Creek (tributary to Nueces River).

FIRST YEGUA CREEK.—Burleson, Lee, and Milam counties; rises near the town of Rockdale; flows southeasterly 29 miles along Burleson-Lee county line to its junction with Second Yegua Creek, forming Yegua Creek (tributary to Brazos River) about 5 miles southeast of Dime Box, in southeastern part of Lee County. Taylor topographic map.

FISH CREEK.—Angelina County; small tributary to Cypress Creek, and thus to Neches River south of Dunkin in southeastern part of county.

FISH CREEK.—Cooke County; formed about 6½ miles east of Marysville in northern part of county by junction of North and South Fish Creek; flows northeasterly 2½ miles into Red River (tributary to the Mississippi). Gainesville topographic map.

FISH CREEK.—Nolan and Runnels counties; rises 5 miles northwest of Hylton in the southeastern part of Nolan County; flows southeastward 16 miles into Valley Creek (tributary to Colorado River) 9 miles east of Fort Chadbourne. Sweetwater topographic map.

FISH CREEK.—Tarrant and Dallas counties; rises 2 miles south of Johnson Station in Tarrant County; flows northeasterly 12 miles into Mountain Creek (tributary to West Fork of Trinity River, and thus to Trinity River) about 4 miles southeast of Grand Prairie in Dallas County. Fort Worth and Dallas topographic maps.

FISH CREEK.—Falls County; rises near Falls-McLennan county line; flows southwesterly 8 miles into Brazos River.

FISH CREEK.—Young County; rises 2 miles northwest of Murray in southwestern part of county; flows eastward 3 miles into Brazos River 4 miles northwest of mouth of Clear Fork of Brazos River.

FISH CREEK.—Shackelford County; rises 8 miles northwest of Albany; flows northwesterly 13 miles to its junction with Clear Fork of Brazos River (tributary to the Brazos) in northwestern part of county. Anson and Albany topographic maps.

FISH OR EAST FORK OF HUBBARD CREEK.—Eastland and Shackelford counties; rises 8 miles south of Bremen; flows northerly 22 miles into Battle Creek (tributary to Bear Creek and thus through Sandy, Hubbard, and Gonzales creeks to Clear Fork of Brazos and Brazos rivers) in southeast corner of Shackelford County. Albany topographic map.

FISH POND CREEK.—Waller County; rises near Gladish; flows southerly 15 miles into Brazos River, 7 miles south of Hempstead in western part of county.

FISH SPRING BRANCH.—Johnson County; small stream flowing into Mountain Creek (tributary to West Fork of Trinity River, and thus to the Trinity) about 3 miles northeast of Alvarado. Cleburne topographic map.

FISH OR BRUSHY LAKE.—Bowie County; about 6 miles north of Hooks Post Office in northeastern part of county; outlet, Red River (tributary to the Mississippi); formerly a channel of Red River; very small.

FITZGERALD CREEK.—Concho County; a stream 11 miles in length flowing into Brady Creek (tributary to San Saba River and thus to the Colorado) southwest of Eden in the southern part of the county. Eden topographic map.

FIVEMILE CREEK.—Dallas County; rises about 2 miles south of Hale in south central part of county; flows southeasterly 13 miles into Trinity River 2 miles northeast of Hutchins. Dallas topographic map.

FIVEMILE CREEK.—Dewitt County; rises in southern part of county; tributary through Cottonwood and Coleto creeks to Guadalupe River.

FIVEMILE CREEK.—Edwards County; a small intermittent tributary to West Nueces River (thence to the Nueces) in southern part of county; flows easterly 7 miles. Nueces topographic map.

FIVEMILE CREEK.—Gonzales County; rises in south-central part of county 6 miles south of Gonzales; flows southerly 16 miles into Sandies Creek (tributary to the Guadalupe) near southeastern county line.

FLAG BRANCH.—Jones County; rises 3½ miles northeast of Sandersville in northeastern part of county; flows northeasterly 10 miles into California Creek (tributary through Clear Fork of Brazos to Brazos River) west of Old Nabors. Anson topographic map.

FLAG CREEK.—Gillespie County; 6 miles east of Harper in the southwestern part of county; tributary through the Pedernales to Colorado River; length, 6 miles. Kerrville topographic map.

FLAG CREEK.—Llano County; an intermittent tributary through Llano River to the Colorado in central part of county southwest of Llano; length, 7 miles. Llano topographic map.

FLAG CREEK.—Bosque and Erath counties; rises at Flag Creek Gap in the southeastern corner of Erath County; flows easterly into East Bosque River (tributary to Bosque River and thus to the Brazos) 4 miles west of Walnut in the western part of Bosque County. Granbury topographic map.

FLAT BRANCH.—Llano County; small intermittent stream flowing into Wolf Creek (tributary to Pecan Creek, thence to Llano River and thus to the Colorado) 4 miles west of Babyhead. Llano topographic map.

FLAT CREEK.—Blanco County; west of Shingle Hills; flows into Pedernales River (tributary to Colorado River) in eastern part of county; length, 8 miles. Blanco topographic map.

FLAT CREEK.—Cass County; rises about 2 miles south of Munz in northwestern part of Cass County; flows southeasterly 14 miles into Black Cypress Bayou (tributary to Big Cypress Bayou, thence through Caddo Lake and Red River to the Mississippi) about 4 miles east of Jefferson in southern part of Marion County.

FLAT CREEK.—Cooke County; an intermittent stream flowing into Cedar Creek (tributary to Elm Fork of Trinity River and thus to the Trinity) south of Hood. Gainesville topographic map.

FLAT CREEK.—Edwards County; a small intermittent tributary in southern part of county; unites with West Nueces River (thence to Nueces River) about one mile below Kickapoo Spring; flows northeasterly 7 miles. Nueces topographic map.

FLAT CREEK.—Erath and Comanche counties; rises in extreme western part of Erath County; flows southerly 8 miles into Leon River (tributary through Little River to the Brazos) 5 miles north of DeLeon in northern part of Comanche County. Eastland and Stephenville topographic maps.

FLAT CREEK OR WEST FORK OF NECHES RIVER.—Henderson County; rises about 4 miles northeast of Athens; flows easterly 22 miles into Neches River.

FLAT CREEK.—Llano and San Saba counties; rises north of Wilberns Glen near the San Saba-Llano county line; flows easterly 14 miles, crosses the San Saba-Llano county line several times and empties into Colorado River in the extreme southeastern corner of San Saba County 3 miles northwest of Tow. Llano and Burnet topographic maps.

FLAT CREEK.—McLennan County; rises 2 miles northwest of Hewitt in central part of county; flows easterly 15 miles into Brazos River. Temple topographic map.

FLAT ROCK BRANCH.—Throckmorton County; rises 6 miles southwest of Throckmorton; flows southerly 6 miles into Clear Fork of Brazos River (tributary to Brazos River).

FLAT ROCK CREEK.—Blanco and Burnet counties; rises 2 miles north of Round Mountain in the northern part of Blanco County; flows northward 8½ miles into Colorado River 1 mile southeast of Marble Falls in the southern part of Burnet County. Blanco and Burnet topographic maps.

FLAT ROCK CREEK.—Kendall County; rises east of Comfort; flows through western part of county into Guadalupe River.

FLAT ROCK CREEK.—Kinney County; rises near north line of county; flows southerly 10 miles into West Fork of Sycamore Creek (tributary to Sycamore Creek and thus to Rio Grande) in the northwestern part of county.

FLAT ROCK CREEK.—Lee County; rises 2 miles north of Ledbetter; flows northeastward 5 miles into Nails Creek (tributary through Cedar Creek to Yegua Creek and thus to Brazos River).

FLAT ROCK CREEK.—Somervell County; rises near the village of Hill Creek in southern part of county; flows northeasterly 16½ miles into Brazos River 4 miles southeast of Glenrose. Granbury topographic map.

FLAT ROCK CREEK.—Stephens County; a southeasterly flowing stream 4 miles in length joining North Palo Pinto Creek (tributary to Palo Pinto Creek and thus to Brazos River) 6 miles north of Ranger in southern corner of county; Breckenridge topographic map.

FLAT ROCK CREEK.—Throckmorton County; a southeastward flowing stream 3 miles long joining Elm Creek (which discharges into Brazos River) near Williamsburg in northern part of county.

FLEMING OR CANEY CREEK.—Cass and Morris counties; rises about 2 miles north of Naples in northern part of Morris County; flows northeasterly into Jennings Lake (tributary to Sulphur River which discharges into the Mississippi through Red River) in northwestern part of Cass County; length, 4 miles. Daingerfield topographic map.

FLINT CREEK.—Coryell County; a small stream flowing southeasterly 4 miles into Turkey Creek (tributary to Leon River and thus through Little River to the Brazos) in southeastern part of county. Gatesville topographic map.

FLINT CREEK.—Young County; rises in eastern part of county; flows southwestward 12 miles into Salt Creek (tributary to Brazos River) 2 miles northwest of Graham.

FLINT ROCK CREEK.—Young County; a small stream flowing southwesterly 5 miles into Brazos River 3 miles south of Graham.

FLORES BAYOU.—Brazoria County; rises near Angleton in central part of county; flows southeasterly 11 miles into Austin Bayou, thence to Bastrop Bay and Gulf of Mexico.

FORKY DEER CREEK.—Leon County; rises 3 miles northwest of Flynn; flows southwesterly 12 miles into Navasota River (tributary to the Brazos) in southwestern part of county.

Fort White Creek.—Grayson and Collin counties; rises 2 miles southwest of Howe; flows southwesterly 11 miles into East Fork of Trinity River (tributary to Trinity River) about 2 miles east of Weston in Collin County.

Foster Branch.—McLennan County; rises 3 miles northeast of Moody; flows northeasterly into south Cow Bayou (tributary to North Cow Bayou, thence to Cow Bayou, and thus to the Brazos); partially intermittent. Temple topographic map.

Fourmile Creek.—Kent County; small stream flowing northeasterly 8 miles into Salt Fork of Brazos River (tributary to the Brazos) 4 miles northwest of Clairemont.

Fourmile Creek.—Jasper County; rises 4 miles northwest of Jasper; flows southerly 5 miles into Sandy Creek (tributary to Neches River) about 2 miles southwest of Jasper.

Fourmile Draw.—Presidio County; rises 8 miles northwest of Marfa in northern part of county; flows southeasterly 10 miles into Alamita Creek (thence to Rio Grande) 4 miles south of Marfa; intermittent. Marfa topographic map.

Fourth Creek.—Lipscomb County; an intermittent stream rising 13 miles north of Lipscomb and flowing southerly into Wolf Creek (tributary to North Fork of Canadian River and thus through Canadian and Arkansas rivers to the Mississippi) 3 miles west of Lipscomb near center of county.

Foyle Creek.—Shackelford County; rises 10 miles northwest of Albany in north central part of county; flows easterly 20 miles into Clear Fork of Brazos River (tributary to Brazos River) 2 miles west of Stephens-Shackelford county line. Albany topographic map.

Francisco Perez Creek.—Medina County; rises in southern part of county; flows southward 14 miles into Rosales or Chacon Creek (tributary to Nueces River through San Miguel and Frio rivers) on Frio-Medina county line.

Frazier Canyon.—Jeff Davis County; rises 8 miles northwest of Fort Davis in Davis Mountains; flows northeastward 12 miles to its junction with Limpia Creek (thence through Paisano Creek to Pecos River and thus to Rio Grande); intermittent. Fort Davis topographic map.

Frazier Creek.—Jasper County; small stream flowing into Neches River about 6 miles north of Evadale.

Frazier Creek.—Cass County; rises about 3 miles north of Almira in western part of county; flows southeasterly 26 miles into Jim Bayou (tributary to Caddo Lake, thence through Red River to the Mississippi) near its intersection with south line of county. Linden and Atlanta topographic maps.

Freestone Creek.—Clay and Montague counties; rises near Newport in southeastern part of Clay County; flows southeasterly into Big Sandy Creek (tributary to West Fork of Trinity River and thus to the Trinity) in the southwestern corner of Montague County.

French Creek.—Bexar County; an intermittent stream; flows into Leon Creek (tributary through Medina River to San Antonio River and thus to the Guadalupe) northwest of San Antonio. San Antonio topographic map.

French Creek.—Uvalde County; small intermittent tributary to East Nueces River (thence to the Nueces) in northwestern part of county; length, 5 miles. Brackett topographic map.

French John Creek.—Llano County; an intermittent stream flowing into Llano River (tributary to Colorado River) 4 miles northwest of Kingsland in southeastern part of county; length, 3 miles. Burnet topographic map.

Fresno Creek.—Brewster County; rises on eastern side of Chisos Mountains 10 miles north of Reed Camp in southern part of county; flows southeasterly into Rio Grande at Solis Ranch. Chisos Mountains topographic map.

Fresno Creek.—Presidio County; small stream rising in southeastern part of county and flowing southerly into Rio Grande 5 miles northwest of Lajitas. Terlingua topographic map.

Frio Creek.—Castro and Swisher counties; rises about 6 miles northeast of Nazareth in eastern part of Castro County; takes an eastward course about 23 miles, enters Tule Creek (tributary to Prairie Dog Town Fork of Red River, thence to Red River, and thus to the Mississippi) 5 miles northeast of Tulia in central part of Swisher County; dry channel carrying flood waters only at rare intervals; course and origin not well defined.

Frio River.—Rises in north central part of Real County; flows southeasterly and easterly traversing Real County 32 miles, Uvalde County 50 miles, Frio County 40 miles, La Salle County 25 miles, McMullen County 34 miles, and Live Oak County 16 miles, uniting with Atascosa River at Three Rivers and flowing into Nueces River 2 miles south of Three Rivers, near central part of Live Oak County; length 200 miles; drainage area, 7,310 square miles. The stream is of considerable economic value and use is made of its waters for irrigation and domestic purposes at a number of points (see Nueces River). Gaging stations maintained at Derby and Fowlerton. Uvalde topographic map.

Frisco Creek.—Hansford County; rises in northwestern part of county; flows northerly into Coldwater Creek (tributary to Beaver River and thus through North Fork of Canadian, Canadian, and Arkansas Rivers to the Mississippi) in southern part of Texas County, Okla.

Frog Creek.—Clay County; an intermittent stream flowing into Red River (tributary to the Mississippi) in northern part of county east of Byers.

Frog Pond Creek.—Concho County; rises in western part of county; flows 12 miles into Kickapoo Creek and thus to Concho River (tributary to the Colorado). San Angelo topographic map.

Fulcher Creek.—Dewitt County; small tributary to Guadalupe River northwest of Hochheim in northern part of county.

Fuzzy Creek.—Runnels and Concho counties; a stream 11 miles long in northeastern part of Concho County and southeastern part of Runnels County north of Paint Rock; flows into Concho River and thus to the Colorado. Ballinger topographic map.

Gabler Creek.—Garza County; a stream 4 miles long rising in southeastern part of county and flowing southerly into Double Mountain Fork of Brazos River (tributary to the Brazos).

Gageby Creek.—Hemphill and Wheeler counties; rises in northwestern part of Wheeler County; flows northeasterly about 15 miles into Washita River (tributary to Red River and thus to the Mississippi) about 3 miles southwest of Gem in southern part of Hemphill County.

Gages Creek.—Young County; a stream flowing southeasterly 4 miles into Clear Fork of Brazos River (tributary to Brazos River) near Eliasville in southern part of county. Breckenridge topographic map.

Gallion Creek.—Sabine County; small stream in southwestern part of county; flows into Devils Ford Creek (thence to Bear Creek, Ayish Bayou, Angelina, and Neches rivers) in southwestern part of county.

Gallinas Creek.—Atascosa County; rises in northeastern part of county; flows southward 12 miles into Atascosa River (tributary to Frio River and thus to the Nueces) 2 miles east of Pleasanton.

Gap Creek.—Brown County; a stream 5 miles long southeast of Clio in the eastern part of the county; flows into Salt Creek (tributary to Pecan Bayou and thus to the Colorado). Brownwood topographic map.

Gap Creek.—Runnels County; rises in northeastern part of county 3 miles southwest of Content; flows southwesterly 10 miles into Elm Creek (tributary to Colorado River); partially intermittent. Abilene and Ballinger topographic maps.

Gapher Creek.—Borden County; small stream 5 miles long in northeastern part of county; flows into Ettas Creek and thus through North Fork of Colorado River to the Colorado.

Gariolas Creek.—Victoria County; rises in northern part of county; flows southeasterly 21 miles into Arenosa Creek (thence to Gulf of Mexico through Lavaca and Matagorda bays).

Garcia Creek.—Terrell County; rises in southwestern part; flows southwesterly 4½ miles into Sanderson Canyon (tributary to Rio Grande); intermittent. Dryden Crossing topographic map.

Gary Creek.—Bosque County; a southeastward flowing stream 8 miles long, joining Neil Creek (tributary to Bosque River and thence to the Brazos) southeast of Norse in southern part of county. Meridian topographic map.

Garrett Creek.—Wise County; joins Boggy Creek (which discharges through West Fork of Trinity River into the Trinity) in central part of county.

Garrett Creek.—Grimes and Montgomery counties; rises in eastern part of Grimes County; flows southeasterly 5½ miles through Grimes County; then ½ mile through Montgomery County into Lake Creek (tributary to West San Jacinto River, thence to San Jacinto River and Gulf of Mexico).

Garretts Creek.—Hopkins and Rains counties; rises in southwestern part of Hopkins County; flows southerly about 14 miles into Lake Fork of Sabine River (tributary to the Sabine) in northern part of Rains County.

Gasconades Creek.—Coke and Sterling counties; rises in the northeast corner of Sterling County; flows easterly 12 miles into Colorado River in northwest corner of Coke County.

Gassey Creek.—Childress County; rises about 5 miles west of Childress; flows northerly 9 miles into Prairie Dog Town Fork of Red River (tributary to the Red and thus to Mississippi River).

Gato Creek.—Uvalde and Zavalla counties; a small intermittent tributary rising 2 miles south of Cline Mountains and flowing into Chapparosa Creek (thence to Nueces River through Turkey and Elm creeks) in the southwestern part of Uvalde County and the northwestern part of Zavalla County; length, 14 miles. Brackett topographic map.

Gaxley Creek.—Bastrop County; small intermittent tributary uniting with Colorado River in the town of Smithville in southeastern part of county; length, 4 miles. Bastrop and Faltonia topographic maps.

Gee Branch.—Hill and Johnson counties; rises in southern part of Johnson County; flows southerly 6 miles into Aquilla Creek (tributary to Brazos River) 2 miles south of Covington in northern part of Hill County. Cleburne topographic map.

Gentry Creek.—Jack and Wise counties; rises about 2 miles east of Joplin in Jack County; flows northeasterly 14 miles into West Fork of Trinity River (tributary to the Trinity) near Bridgeport in the central part of Wise County.

George Creek.—Somervell and Johnson counties; rises 3 miles west of Bono in southwestern part of Johnson County; flows southwesterly 8 miles into Brazos River, 2½ miles southwest of "Georges Creek" in eastern part of Somervell County. Granbury topographic map.

GERONIMO CREEK.—Edwards County; a small intermittent tributary to West Nueces River (thence to the Nueces) in western part of county; flows southeasterly 6 miles. Nueces topographic map.

GERONIMO CREEK.—Guadalupe County; rises northwest of Geronimo in the northwestern part of county; flows southeasterly 15 miles into Guadalupe River about 4 miles southeast of Seguin in central part of county. San Marcos topographic map.

GERONIMO CREEK.—Medina County; northeastern part of county; an intermittent stream joining Medina River (tributary to San Antonio River and thus to the Guadalupe) 4 miles north of Castroville.

GHOLSON CREEK.—Garza County; rises 2 miles southeast of Southland; flows easterly 9 miles into North Fork of Double Mountain Fork of Brazos River (tributary to Double Mountain Fork of the Brazos, thence to the Brazos) in northwestern part of county.

GIBBONS BRANCH.—Cooke County; a small intermittent tributary to Elm Fork of Trinity River (which discharges into the Trinity) west of the town of Muenster in southwestern part of county. Gainesville topographic map.

GIBBONS CREEK.—Grimes County; a small stream flowing southwesterly into Smith Creek (tributary to Ben Fort Creek and thus througth Navasoto River to the Brazos); length, 5 miles.

GIBSON CREEK.—Ochiltree and Lipscomb counties; rises in southeastern corner of Ochiltree County; flows northeasterly into Wolf Creek (tributary to North Fork of Canadian River, and thus through the Canadian and Arkansas river to the Mississippi) one mile south of Valley Park, western part of Lipscomb County.

GIBSON CREEK.—Palo Pinto and Erath counties; rises near Harriet Mountain in northern part of Erath County; flows northerly 9 miles into Palo Pinto Creek (tributary to Brazos River) 3 miles northeast of Mingus in southwestern part of Palo Pinto County. Stephenville and Palo Pinto topographic maps.

GIDDINGS OR NAILS CREEK.—Lee County; rises at Giddings; flows northeasterly 20 miles into Yegua Creek (tributary to Brazos River).

GILADON CREEK.—Van Zandt County; rises at Edgewood; flows northeasterly 12 miles into Sabine River about 4 miles northwest of Grand Saline.

GILBERT CREEK.—Wichita County; rises about 9 miles northwest of Iowa Park in northern part of county; flows easterly 15 miles into Red River (tributary to the Mississippi) 3½ miles west of northeastern corner of county.

GILHULA CREEK.—Ochiltree and Lipscomb counties; rises 12 miles east of Ochiltree; flows southeasterly 10 miles into Wolf Creek (tributary to North Fork of Canadian River and thus through Canadian and Arkansas rivers to the Mississippi) 3 miles east of Valley Park in western part of Lipscomb County.

GILL CANYON.—Presidio County; an intermittent stream 5 miles long flowing into Rio Grande 3 miles north of Upper San Antonio, Mexico. San Carlos topographic map.

GILLELAND CREEK.—Travis County; rises 4 miles north of Pflugerville in northern part of county; flows southeasterly 21 miles into Colorado River one mile west of Webberville. Austin topographic map.

GILLS CREEK.—Bastrop County; rises 2 miles northeast of Bastrop; flows southwesterly 2½ miles into Colorado River just below Bastrop; intermittent. Bastrop topographic map.

GILMORE CREEK.—Erath County; a stream 8 miles long flowing northeasterly into Spring Creek (tributary to Bosque River and thus to the Brazos) 4 miles west of Hico in southern part of county. Hamilton topographic map.

GINHOUSE LAKE.—Bowie County; about 6 miles north of Hooks Post Office in northeastern part of county; formed by an old channel of Red River (tributary to the Mississippi); very small.

GIBANDS CREEK.—Martin, Howard, and Mitchell counties; rises near Stanton in the southeastern corner of Martin County; flows easterly 10 miles through Martin County, 32 miles through Howard County, then 20 miles through Mitchell County into the Colorado 9 miles southeast of Spade in the southern part of Mitchell County.

GIVEN CREEK.—Throckmorton and Stephens Counties; flows southeasterly 11 miles into Clear Fork of Brazos River (tributary to the Brazos) in the northwest corner of Stephens County. Albany topographic map.

GLADE CREEK.—Hopkins and Franklin counties; rises in southeastern part of Hopkins County; flows northeastward into Big Cypress Creek (tributary to Caddo Lake, thence to Red River and thus to the Mississippi) in southwestern part of Franklin County.

GLADE OR PRAIRIE CREEK.—Upshur and Gregg counties; rises east of Glenwood in southeastern part of Upshur County; flows northeasterly 4 miles into Little Cypress Creek (tributary to Caddo Lake and thus to Red and Mississippi rivers) at the northern boundary of Gregg County.

GLADE CREEK.—Wood County; flows southwesterly about 5 miles into Lake Fork of Sabine River (tributary to the Sabine) in central part of county.

GLADES CREEK.—Upshur and Gregg counties; rises about 5 miles southwest of Gilmer in Upshur County; flows southeasterly 13 miles into Sabine River in the northwestern corner of Gregg County near Gladewater.

GLENN CREEK.—El Paso County; rises 6 miles south of Dalberg; flows southerly 16 miles into Rio Grande, 20 miles south of Dalberg in the extreme southeastern corner of the county. Chispa topographic map.

GLENWOOD CREEK.—Donley County; rises about 2½ miles southeast of Evans in northern part of county; flows southerly 10 miles into Saddlers Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red to Red River and thence to the Mississippi).

GLENN DRAW.—Brewster County; flows southeasterly 16 miles into Rio Grande 15 miles west of Boquillas in southern part of county; intermittent. Chisos Mountains topographic map.

GOAT CREEK.—Brewster County; rises between Goat and Cienega mountains 15 miles south of Alpine; flows southerly 15 miles to Maravilla Creek (tributary to Rio Grande). Alpine topographic map.

GOAT CREEK.—Kerr and Gillespie counties; small tributary to Guadalupe River northwest of the town of Kerrville. Kerrville topographic map.

GODLEY CREEK.—Bowie County; rises approximately 5 miles southwest of New Boston; flows southerly 4 miles into Anderson Creek (tributary through Sulphur River to Red River and thus to the Mississippi) about 2 miles north of Sims in western part of county. New Boston topographic map.

GOLDMINE CREEK.—Llano County; rises west of Oxford; flows through southern part of county into Sandy Creek and thus to Colorado River; length, 4 miles. Llano topographic map.

[illegible] western corner of [illegible] southeastward [illegible] miles through Wharton County [illegible] tributary to Navi[illegible] Bay and thus to Gulf of [illegible]

[illegible] rises in southeastern part [illegible] stream of Attoyac Bayou [illegible]

[illegible] miles northwest of Wayland by [illegible] Creek in southern part [illegible] Clear Fork of Brazos River [illegible] Falls in northern [illegible] Breckenridge topographic map.

[illegible] rises near southern Eastland [illegible] miles into Gonzales Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) 2 miles north of [illegible] map.

Gonzales Creek, West Fork.—[illegible] County; rises near Gunsight Mountain [illegible] with Middle Fork of Gonzales Creek [illegible] Clear Fork of Brazos River and thus to the Brazos [illegible] of Wayland, in southern part of [illegible]

Gonzales Creek, Middle Fork.—[illegible] County; rises near southern Eastland County [illegible] junction with West Fork [illegible] Clear Fork of Brazos River [illegible] of Wayland in southern part of [illegible] topographic maps.

[illegible] Creek.—[illegible] flows southeastward 4 miles [illegible] River and thus through Red River to the Mississippi.

[illegible] Creek.—[illegible] stream flowing northerly 4 miles [illegible] Creek [illegible] Yegua Creek to Yegua Creek and thus to Brazos River [illegible] Bastrop topographic map.

[illegible] Creek.—Baylor and Archer counties; rises in eastern part of Baylor County; flows northeastward [illegible] North Fork of Little Wichita River [illegible] Wichita River and thus through Red River to the Mississippi [illegible] Baylor-Archer County line, in western part of Archer County.

Goose Branch.—Erath County; rises [illegible] of Lingleville, in western part of county; [illegible] South Bosque River (tributary to Bosque River and thus to the Brazos). Stephenville topographic map.

Goose Creek.—Harris County; small [illegible] stream rising in southeastern part of county and flowing southerly 4 [illegible] San Jacinto Bay, thence through Trinity Bay into Galveston Bay and Gulf of Mexico. Burnett Bay, Cedar Bayou, and Morgan Point topographic maps.

Gordon's Branch.—Lee County; a small intermittent stream flowing northerly 4 miles into Second Yegua Creek (tributary to Yegua Creek and thus to Brazos River), in western part of county. Bastrop topographic map.

Gourd Creek.—Houston County; a small tributary to Trinity River in the western part of the county.

Grace Creek.—Gregg County; rises about 6 miles north of Longview; flows southerly 9 miles into Sabine River about 3 miles south of Longview.

Gragg Creek.—Red River County; rises about 4 miles northeast of Clarksville; flows southeasterly 9 miles into Kickapoo Creek (tributary to Cuthand Creek and thus through Sulphur and Red Rivers to the Mississippi).

Granie Creek.—Shelby County; rises 4 miles southeast of Shelbyville; flows northerly 5 miles, thence easterly 12 miles into Sabine River.

Granite Creek.—Harris County; a continuation of Spring Gully, 3½ miles southwest of Crosby; flows easterly one-half mile into San Jacinto River (tributary to Gulf of Mexico); intermittent. Crosby topographic map.

Grand Saline Creek.—Van Zandt County; rises about 3 miles south of Canton, in central part of county; flows northeasterly 22 miles into Sabine River 1 mile northeast of Silver Lake.

Grannys Branch.—Eastland County; rises 1½ miles northwest of Carbon; flows northerly into South Fork of Leon River (tributary through Middle Fork of the Leon, Leon, and Little rivers, to the Brazos) near Mangum, in central part of county. Eastland topographic map.

Grape or Yellow Wolf Creek.—Coke County; rises about 3 miles northeast of Sanco; flows southerly 12 miles into Colorado River, 6 miles northwest of Robert Lee.

Grape Creek.—Llano County; small tributary through Sandy Creek to Colorado River west of Oxford in southern part of county; length, 4 miles. Llano topographic map.

Grape Creek.—Mason County; an intermittent stream rising northeast of Katemcy in northern part of county; flowing 5 miles into Tiger Creek (tributary to San Saba River, and thus to the Colorado). Mason topographic map.

Grape Creek.—Runnels and Coleman counties: in the southwestern part of Coleman County and southeastern part of Runnels County south of Talpa; flows 18 miles into Colorado River. Ballinger topographic map.

Grapevine Creek.—Dickens and Motley counties; rises in northwestern part of Dickens County; flows northeasterly 7 miles into Olive Fork of South Pease River (tributary through South and Middle Pease rivers to Pease River, and thus through Red River to the Mississippi) in Motley County, one-fourth mile north of the southern boundary line.

Grapevine Creek.—Gray County; rises near central part: flows easterly 6½ miles into North Fork of Red River (tributary to Red River and thus to the Mississippi) 1 mile south of Lefors.

Grapevine Creek.—Tarrant and Dallas counties; rises about 3 miles southeast of the town of Grapevine in Tarrant County; flows easterly 9 miles into Elm Fork of Trinity River (tributary to Trinity River) about 2 miles southwest of Carrollton in northwestern part of Dallas County. Fort Worth and Dallas topographic maps.

Grass Creek.—Bosque County: a northeasterly flowing stream 6 miles long joining Brazos River opposite the extreme northwest point of Hill County. Granbury topographic map.

Grass Hollow.—Edwards County; a small intermittent tributary to West Nueces River (thence to the Nueces) in western part of county; flows southwesterly 4 miles. Nueces topographic map.

Grass Lake.—Bowie County; about 5 miles southwest of Maude in southern part of county; formed by an old channel of Sulphur River (tributary to Red River and thus to the Mississippi). New Boston topographic map.

Grassy Branch.—Johnson County; small tributary to Mountain Creek (which discharges into West Fork of Trinity River and thus to the Trinity) east of Pleasant Point in northeastern part of county. Cleburne and Fort Worth topographic maps.

[illegible] Creek.—Bastrop County; [illegible] northeast of Paige in the southeastern part of county; [illegible] Pin Oak Creek (tributary to Colorado River); length, 7 miles. Bastrop topographic map.

[illegible] Creek.—Cass County; a small intermittent stream entering Sulphur River (tributary through Red River to the Mississippi) about one-half mile southeast of [illegible] in northeastern part of county. Atlanta topographic map.

[illegible] Creek.—Grimes County; rises 7 miles east of Navasota; flows southwesterly [illegible] miles into Brazos River 7 miles south of Navasota in southwestern part of county.

[illegible] Lake.—Red River County; an old channel lake in southeastern part of county formed by former channel of Sulphur River (tributary to Red River, which discharges into the Mississippi).

Grasshopper Creek.—Wise and Denton counties; rises in southern part of Wise County; flows southeasterly about 30 miles into Clear Creek (tributary to Elm Fork of Trinity River, thence to the Trinity) in northwestern part of Denton County. Gainesville topographic map.

Grassy Lake.—Harris County; small lake 7 miles southeast of Humble; one-[illegible] mile long and [illegible] mile wide. Harmaston topographic map.

Gravelly Creek.—Bastrop County; in the southeastern part of the county; small intermittent tributary through Pin Oak Creek into Colorado River; length, [illegible] miles. Bastrop topographic map.

Green Creek.—Erath County; rises 3 miles south of Lingleville in western part of county; flows southeasterly [illegible] miles through Alexander into Bosque River (tributary to the Brazos) near Clairette. Stephenville topographic map.

Green Creek.—Titus County; rises about 7 miles north of Mount Pleasant; flows northerly [illegible] miles into [illegible] Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

Green Lake.—Calhoun County; a tidal lake in western part of county; outlet through Mission Lake to Guadalupe Bayou and thus to San Antonio and Guadalupe rivers.

Green Lake.—Donley County; about 3 miles south of Clarendon; outlet, when overflowing, Clam Lake (which discharges through Clarendon Lake to Little Brushy Creek and thus through Salt Fork of Red River to Prairie Dog Town Fork of the Red, thence through Red River to the Mississippi).

Greens Creek.—Bastrop County; small intermittent stream in the southwestern part of county; joins with Cedar Creek (tributary through Walnut Creek to Colorado River) 3 miles east of the town of Cedar Creek; length, 5 miles. Bastrop topographic map.

Greens Bayou.—Galveston County; a short tidal stream, in southwestern part of county; drains into West Galveston Bay, and thus to Gulf of Mexico.

Greens Bayou.—Harris County; rises 9 miles west of Aldine in the central part of county; flows easterly and southeasterly 42 miles into Ship Channel (Buffalo Bayou) thence to Galveston Bay and Gulf of Mexico 1 mile northwest of Penn City; tidal for 7 miles in lower course. Satsuma, Aldine, Humble, Harmaston, and Fauna topographic maps.

Greenbriar Creek.—Brown and Callahan counties; rises 5 miles north of Cottonwood; flows southeasterly 22 miles into Pecan Bayou (tributary to Colorado River) at north end of Coon Mountain. Coleman topographic map.

GREENBRIAR CREEK.—Coryell County; small stream flowing southeasterly 6 miles into Coryell Creek (tributary to Leon River, and thus through Little River to the Brazos) near Pecan Grove in eastern part of county. Gatesville topographic map.

GREENBRIER CREEK.—Montague County; rises about 2 miles southeast of Greenbrier School in northern part of county; flows northerly 5 miles into Farmers Creek (tributary to Red River and thus to the Mississippi) about 2 miles north of Pigtail School. Montague topographic map.

GRIFFIN CREEK.—Kinney County; a small intermittent stream in northeastern part of county; flows easterly 7 miles to its junction with West Nueces River (thence to the Nueces) near Hillcoat Ranch. Nueces topographic map.

GRINDSTONE CREEK.—Freestone County; rises 7 miles southwest of Fairfield; flows northerly 16 miles into Tehuacana Creek (tributary to Trinity River).

GRINDSTONE CREEK.—Parker County; rises 2 miles southwest of Peister in western part of county; flows southerly 16 miles into Brazos River 1½ miles southeast of Brannon's Ferry. Weatherford topographic map.

GROESBECK CREEK.—Hardeman County; formed about 5 miles northwest of Quanah in northern part of county by union of North and South Groesbeck Creeks; flows easterly 10 miles into Red River (tributary to the Mississippi).

GROESBECK CREEK.—Limestone County; rises 5 miles west of Groesbeck; flows southeasterly 15 miles into Navasota River (tributary to Brazos River).

GROESBECK CREEK, NORTH.—Childress and Hardeman counties; rises about 2 miles northeast of Childress in southeastern part of Childress County; flows southeastward 30 miles to its junction with South Groesbeck Creek to form Groesbeck Creek (tributary to Red River and thus to the Mississippi) 5 miles northwest of Quanah in northern part of Hardeman County.

GROESBECK CREEK, SOUTH.—Childress and Hardeman counties; rises in southeastern part of Childress County; flows northeastward 25 miles to its junction with North Groesbeck Creek to form Groesbeck Creek (tributary to Red River and thus to the Mississippi) about 5 miles northwest of Quanah in northern part of Hardeman County.

GUADALUPE RIVER, SOUTH FORK.—Kerr County; headwater stream of Guadalupe River; rises in southern part of county; flows northerly 8 miles to its junction with North Fork of Guadalupe River forming Guadalupe River about 1 mile southeast of Japonica. Kerrville topographic map.

GUADALUPE RIVER, NORTH FORK.—Kerr County; upper tributary to Guadalupe River; rises in western part of county; flows easterly 22 miles to a point 1 mile southeast of Japonica where it unites with South Fork of Guadalupe River to form Guadalupe River. Kerrville topographic map.

GUADALUPE RIVER.—Rises in the western part of Kerr County; flows southeasterly 255 miles traversing the counties of Kerr, Kendall, Comal, Guadalupe, Gonzales, Dewitt, Victoria, Calhoun, and Refugio; empties into San Antonio Bay (an arm of the Gulf of Mexico); area of drainage basin, 6,000 square miles; principal tributaries, Comal and San Marcos rivers, both perennial-flowing spring fed streams, entering Guadalupe River, the former at New Braunfels, the latter at a point 1½ miles southwest of Gonzales, and San Antonio River, which enters this stream a short distance above San Antonio Bay.

A uniform flow from springs along the Balcones escapement makes the stream of power value, and a small percentage of the flow is now utilized [illegible] power [illegible] and there appear to be [illegible]. Above New Braunfels the stream flows through a [illegible] the basin is more level and [illegible] precipitation varies from [illegible] inches at [illegible] inches at Cuero in the lower part of the [illegible]. New Braunfels, Gonzales, and [illegible] and San Marcos topographic maps.

See [illegible] Report of Texas Board of Water Engineers for list of [illegible] drainage.

G[illegible] Creek.—Brewster County; rises in the western part, 2 miles south of Pine [illegible] Rio Grande; intermittent. [illegible] topographic maps.

Guadalupe Bayou.—[illegible] formed by Guadalupe River [illegible] Bay and [illegible] Gulf of Mexico.

Guest Creek.—Red River County; rises [illegible] 2 miles northwest of Detroit in western part of county; flows [illegible] 20 miles into Cuthand Creek (tributary to [illegible] River [illegible] Red River to the Mississippi) 8 miles south of Clarksville.

Gum Gully.—Harris County; rises 4 miles northwest of Crosby near Gum Gully School; flows [illegible] into [illegible] Bayou (tributary to San Jacinto River [illegible]) [illegible] partially intermittent. Crosby topographic map.

Gun Canyon Creek.—Armstrong County; rises in southern part of county; flows southerly 2 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi).

Gyp Creek.—Knox County; a small stream 11 miles in length flowing southerly into Brazos River in southern part of county.

Gypsum Creek.—Armstrong County; rises in southern part; flows southeasterly 7 miles into Prairie Dog Town Fork of Red River, thence to Red River and thus to the Mississippi.

Gypsum Creek.—Childress County; a stream 9 miles long flowing southeasterly through the northern part of county into Prairie Dog Town Fork of Red River (which discharges into the Mississippi through Red River).

Gypsum Creek.—Stonewall and Fisher counties; a stream flowing northerly 15 miles into Double Mountain Fork of Brazos River (tributary to the Brazos) in southern part of county about 8 miles southwest of Aspermont. Roby topographic map.

Hackberry Creek.—Briscoe County; rises in northeastern part; flows southeasterly into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi); length, 9 miles.

Hackberry Creek.—Dallas County; rises about 2 miles southeast of Gibbs; flows southeasterly 6 miles into Elm Fork of Trinity River (tributary to Trinity River) about 3 miles northwest of Letot. Fort Worth and Dallas topographic maps.

Hackberry Creek.—Edwards County; a small intermittent tributary in western part of county; unites with West Nueces River (tributary to the Nueces) about 1 mile above Black Water Hole; flows southwesterly 9 miles. Nueces topographic map.

Hackberry Creek.—Edwards County; rises in the central part of county; flows southeasterly 18 miles into East Nueces River (thence to the Nueces) forming Devils Sink Hole (headwaters of East Nueces River) 15 miles north of Barksdale. Rock Springs and Nueces topographic maps.

Hackberry Creek.—Edwards County; tributary to Pulliam Creek (tributary to Nueces River) in eastern part of county, about 8 miles northwest of Barksdale; flows southerly 10 miles. Nueces topographic map.

Hackberry Creek.—Erath County; rises 1 mile northwest of Lingleville; flows southwestward 7 miles into Armstrong Creek (tributary through Leon River to Little River and thence to the Brazos) near Armstrong in western part of county. Stephenville topographic map.

Hackberry Creek.—Hill County; rises near Itasca in northern part of county; flows southward 22 miles into Aquilla Creek (which discharges into Brazos River) 2 miles southwest of Vaughan. Cleburne and Waco topographic maps.

Hackberry Creek.—King County; a northerly flowing stream joining Croton Creek (tributary to the Brazos) 6 miles south of Guthrie in Southern part of county; length, 6 miles.

Hackberry Creek.—King County; rises in northwestern part of county; flows southeasterly 5 miles into Willow Creek (tributary to South Wichita River and thus through Wichita and Red rivers to the Mississippi).

Hackberry Creek.—Mitchell and Sterling counties; rises in northern part of Sterling County; flows northward 7 miles into Chrystal Creek (tributary to Girands Creek and thus to the Colorado) in southern part of Mitchell County.

Hackberry Creek.—Motley County; rises in southeastern part of county; flows northerly 5 miles into Teepe Creek (tributary through Middle Pease River to Pease River and thus through Red River to the Mississippi) about 7 miles southwest of Teepee City.

Hackberry Creek.—Uvalde County; small intermittent stream in northern part of county; flows southerly 7 miles into Blanco River (tributary to Sabinal, Frio, and Nueces rivers) 1 mile southeast of Hackberry ranch. Uvalde topographic map.

Hackberry Creek.—Wheeler and Collingsworth counties; rises in southern part of Wheeler County; flows southerly 7 miles into Elm Fork of Red River (tributary through North Fork of Red River to the Red, and thus to the Mississippi) in northern part of Collingsworth County.

Hackley Creek.—Cooke County; small stream flowing into Scott Creek (tributary to Elm Fork of Trinity River, thence to the trinity) south of Fair Plains; intermittent. Gainesville topographic map.

Hagerty Creek.—Harrison County; rises about 2 miles northwest of Scottsville in eastern part of county; flows northerly 11 miles into Caddo Lake (tributary to Red River and thus to the Mississippi) in the northeastern part of the county.

Hairston Creek.—Burnet County; small stream flowing into Hamilton Creek and thus to Colorado River about midway between Burnet and Marble Falls in the southern part of county; length, 7 miles. Burnet topographic map.

Haley Branch.—Johnson County; rises 2 miles south of Bono in western part of county; flows southeasterly 8 miles into Nolands River (tributary to Brazos River) a mile west of the village of Rio Vista. Granbury and Cleburne topographic maps.

Halifax Creek.—Hays County; small intermittent stream northwest of Kyle in eastern part of county; flows into Blanco River (tributary through the San Marcos to Guadalupe River). Blanco and Austin topographic maps.

HALL CREEK.—Donley County; rises about 6 miles southwest of Clarendon; flows southwesterly 7 miles into Big Sandy Creek, thence through Mulberry Creek to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi River.

HALL CREEK.—Floyd and Motley counties; rises in eastern part of Floyd County; flows easterly 3 miles into Pease River (tributary to Red River and thus to the Mississippi) in western part of Motley County.

HALLS BAYOU.—Brazoria and Galveston counties; rises 6 miles northeast of Alvin in eastern part of Brazoria County; flows southeasterly 9 miles through Brazoria County into Galveston County, where it continues its course for 2 miles; recrosses into Brazoria County then flows southwesterly 4 miles into West Galveston Bay (thence to Gulf of Mexico). A short distance above its mouth it widens and forms Halls Lake.

HALLS BAYOU.—Harris County; rises in the north central part of the county; flows southeasterly 11 miles through Greens Bayou into Ship Channel, thence to Galveston Bay and Gulf of Mexico. Aldine, Humble and Settegast topographic maps.

HAM CREEK. Cass County; a small intermittent stream entering Shoal Creek (tributary through Sulphur River to Red River and thus to the Mississippi) about 3½ miles north of Anti School in Northern part of county. Linden topographic map.

HAMILTON CREEK.—Burnet County; rises 4 miles northwest of Burnet in the western part of county; flows southerly 20 miles into Colorado River at Pangle Crossing, 3½ miles east of Marble Falls. Burnet topographic map.

HAMILTON CREEK.—Hays and Travis counties; rises west of Shingle Hills in northern part of Hays County; flows northwestward 4 miles into Pedernales River just below Hamilton Pool post office, and thus to Colorado River. Blanco topographic map.

HAPPY CREEK.—Armstrong County; rises in southwestern part of county; flows northeasterly 9 miles into Prairie Dog Town Fork of Red River, thence to Red River, and thus to the Mississippi.

HARBER OR AIKEN CREEK.—Bowie County; rises about 1 mile southeast of Leary; flows southeasterly 11 miles into Elliott Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 6 miles west of Draper in southeastern part of county. Texarkana topographic map.

HARDEN BRANCH.—Concho County; a small stream flowing to the west and southwest of Eden in southern part of county; empties into Brady Creek (and thus through San Saba to Colorado River); length, 8 miles. Eden topographic map.

HARDEMAN BRANCH.—Washington County; small intermittent stream flowing into Rocky Creek (tributary to Brazos River) southeast of Independence. Gay Hill topographic map.

HARDYS CREEK.—Lavaca County; rises in southeastern part of county; flows southeastward 12 miles into Navidad River (tributary to Lavaca River, thence to Matagorda Bay and thus to Gulf of Mexico) near Lavaca-Jackson county line.

HARMONS CREEK.—Walker County; rises near the town of Huntsville; flows northeasterly 14 miles into Trinity River near Riverside.

HARRIS BAYOU.—Harris County; rises in southwestern part of city of Houston; flows southeasterly 2 miles into Brays Bayou, thence through Ship Channel to Galveston Bay and Gulf of Mexico.

HARRIS CREEK.—Bowie County; rises about 1½ miles north of Texarkana; flows southerly 3 miles to its junction with Ward Creek 1½ miles south of Texarkana to form Hurricane Creek (tributary to Sulphur River, and thus through Red River to the Mississippi). Texarcana topographic map.

HARRIS CREEK.—Grayson County; rises about 5 miles west of Sherman in central part of county; flows northwesterly 9 miles into Mineral Creek (tributary to Red River and thus to the Mississippi) 2 miles north of Steedman. Denison topographic map.

HARRIS CREEK.—McLennan County; rises 3 miles southwest of McGregor in southwestern part of county; flows northeasterly 12 miles into South Bosque River (tributary to Bosque River and thus to the Brazos) 1½ miles southwest of South Bosque. Temple topographic map.

HARRIS CREEK.—McLennan County; rises near Coryell-McLennan county line; flows northward 8 miles into Tonk Creek (tributary through Middle Bosque, South Bosque, and Bosque rivers to the Brazos) 1 mile east of Crawford. Temple topographic map.

HARRIS CREEK.—Smith County; rises about 6 miles east of the town of Tyler; flows northeasterly 15 miles; empties into Sabine River about 5 miles northeast of Winona.

HARSLEYS CREEK.—Van Zandt County; small stream in southeastern part of county flowing easterly 6 miles into Neches River.

HARTS CREEK.—Titus County; rises about 3 miles north of Mount Pleasant in central part of county; flows southerly 11 miles into Big Cypress Bayou (tributary to Caddo Lake, thence to Red River, and thus to the Mississippi) in the southern part of the county.

HARVEY BAYOU.—San Augustine County; rises in southwestern part of county; flows southwesterly into Angelina River (tributary to Neches River); length, 6 miles.

HARVEY CREEK.—Fayette and Colorado counties; rises just north of Weimar in southeastern part of Fayette County; flows eastward 8 miles into Colorado River in western part of Colorado County.

HARVEY DRAW.—Garza County; rises in northwest corner of county; flows northeasterly 3 miles into Spring Creek (a tributary through North Fork of Double Mountain Fork of Brazos River to the Double Mountain Fork, thence to the Brazos) near Garza-Crosby county line.

HAW BRANCH.—Caldwell County; south of Dale; flows into Dry Creek (tributary to Plum Creek and thus through San Marcos River to the Guadalupe). San Marcos topographic map.

HAW BRANCH.—Fayette County; just north of Flatonia in the southwestern part of county; small intermittent tributary through Pinoak to Buckners Creek, and thus to Colorado River; length, 3 miles. Flatonia topographic map.

HAW BRANCH.—Hunt County; a small stream in northeastern part of county flowing into South Sulphur River (thence to Sulphur River and thus through Red River to the Mississippi).

HAY CREEK.—Coleman County; rises west of Trickham in the southeastern part of county; flows into Mukewater Creek and thus through Home Creek to Colorado River; length, 12 miles. Coleman and Brady topographic maps.

HAY HOLLOW.—Donley County; north central part; small stream flowing into Saddlers Creek, thence through Salt Fork of Red River to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi.

HAYS CREEK.—[illegible] County; [illegible] 7 miles into Prairie Creek, and thus through East Fork of [illegible] to Angelina River (tributary to Neches River) in southwestern part of county.

HAYRICK CANYON.—[illegible] County; rises near Hayrick Mountain; flows southward 7 miles into [illegible] Fork of Brazos River and thus to the Brazos.

HEATHS CREEK.—Brewster County; rises 15 miles north of Boquillas; flows in an easterly course 30 miles to its junction with Rio Grande 15 miles northeast of Boquillas; intermittent. Chisos Mountains topographic map.

H[illegible] CREEK.—Potter County; rises 7 miles northeast of Amarillo; flows northwesterly 15 miles into Amarillo Creek (tributary to Canadian River and thus through the Arkansas to Mississippi River) 1 mile above its mouth.

HEEL TOE CREEK.—Red River County; rises about 3 miles southeast of Clarksville; flows southwesterly 10 miles into [illegible] Creek (tributary to Cuthand Creek and thus through Sulphur and Red rivers to the Mississippi).

H[illegible] OR BA[illegible] CREEK.—Collin and Hunt counties; a head water stream of Sabine River; rises about 3 miles northeast of Farmersville; flows southeasterly 18 miles into Caddo Fork of Sabine River about 4 miles southwest of [illegible] in Hunt County.

HEMPHILL CREEK.—Hays and Caldwell counties; rises in the southeastern part of Hays County; flows southeast one mile through Hays County; then 6 miles through Caldwell County into Morrison Creek (tributary to San Marcos River and thus to the Guadalupe) one mile east of Martindale. San Marcos topographic map.

HE[illegible] CREEK.—Erath County; rises in northwestern part of county, 2 miles south of Lingleville; flows southwestward into [illegible] Creek (tributary to Armstrong Creek and thus to Leon River); partially intermittent. Stephenville topographic map.

HENRIETTA CREEK.—Wise and Tarrant counties; rises about 4 miles east of Newark in Wise County; flows northeasterly 6 miles into Elizabeth Creek (tributary through Denton Creek to Elm Fork of Trinity River and thus to the Trinity) about 3 miles east of Haslet. Fort Worth topographic map.

HENSON CREEK.—Coryell County; rises west of Henson Mountain in central part of county; flows northeasterly 6 miles into Leon River (tributary to Little River and thus to the Brazos) 3½ miles west of Leon Junction. Gatesville topographic map.

HENSHAW CREEK.—Erath County; flows northeasterly 3 miles to its junction with North Paluxy Creek (which discharges into Brazos River through Paluxy Creek) one mile west of Morgans Mill in northern part of county. Stephenville topographic map.

HERBERT CREEK.—Baylor County; rises in northern part of county; flows southeasterly 3½ miles into Wichita River (tributary to Red River and thus to the Mississippi).

HERMAN CREEK.—Mason County; a stream 9 miles long rising south of Bodeville in eastern part of county and flowing into Llano River (tributary to the Colorado). Mason topographic map.

HERRING BRANCH.—Montague County; a small intermittent stream flowing into Red River (tributary to the Mississippi) about 2 miles west of Valley School in northern part of county. Montague topographic map.

HERRON CREEK.—Bowie County; rises about 1½ miles southeast of Maud; flows southerly 2½ miles through Dixon, Big, and Maldon lakes to Sulphur River (tributary to Red River and thus to the Mississippi); intermittent. [illegible] Boston topographic map.

HICKMAN CREEK.—Newton County; flows easterly 5 miles into Sabine River in northeastern part of county.

HICKORY CREEK.—Blanco County; rises 3 miles north of Sandy in central part of county; flows southerly 8 miles into Pedernales River (tributary to the Colorado) 8 miles northwest of Johnson City. Blanco topographic map.

HICKORY CREEK.—Cooke County; rises about a mile north of Callisburg in northeastern part of county; flows northerly 10 miles into Red River (tributary to the Mississippi) about a mile west of Coesfield. Gainesville topographic map.

HICKORY CREEK.—Dallas County; rises 2 miles south of Mesquite in southeastern part of county; flows southerly 8 miles into Trinity River 4 miles south of Kleburg. Dallas topographic map.

HICKORY CREEK.—Denton County; rises in northwestern part of county; flows southeasterly 30 miles into Elm Fork of Trinity River (tributary to Trinity River) about 2 miles east of Lewisville.

HICKORY CREEK.—South Fork; Denton County; tributary to Hickory Creek (which discharges into Trinity River through Elm Fork of the Trinity) in west central part of county.

HICKORY CREEK.—Llano, Mason, and Gillespie counties; rises near the corner of Llano, Mason, and Gillespie counties; flows northeastward 20 miles into Llano River (tributary to the Colorado) 5 miles northwest of Sixmile. Llano topographic map.

HIGHHILL CREEK.—Fayette County; tributary to Colorado River in the eastern part of the county near La Grange; length, 4 miles.

HIGHLAND BAYOU.—Galveston County; rises in south central part of county; flows southeasterly 13 miles into West Galveston Bay and thus to Gulf of Mexico.

HILL CREEK.—Bosque and Somervell counties; formed 2 miles southwest of Eulogy by the union of the North and South forks of Hill Creek; flows northerly 4 miles into Brazos River 3½ miles west of Brazos Point in eastern part of Somervell County. Granbury topographic map.

HILL CREEK, SOUTH FORK.—Bosque County; rises near Somervell-Bosque county line, 2½ miles southwest of "Hill Creek;" flows northeasterly 7 miles to its junction with the North Fork of Hill Creek forming Hill Creek (tributary to Brazos River) 2 miles southwest of Eulogy. Granbury topographic map.

HILL CREEK, NORTH FORK.—Bosque County; rises 2 miles west of "Hill Creek;" flows easterly 6 miles to its junction with South Fork of Hill Creek forming Hill Creek (tributary to Brazos River) 2 miles southwest of Eulogy. Granbury topographic map.

HILL CREEK.—McMullen County; rises in northern part of county; flows northward 16 miles into Nueces River.

HILLS CREEK.—Burleson County; small stream flowing into Yegua Creek (tributary to Brazos River) north of Hicks in western part of county.

HILLEBRANT BAYOU.—Jefferson County; rises near Beaumont in northern part of county; flows southeasterly 18 miles into Taylors Bayou (thence though Sabine Lake to Gulf of Mexico) 3½ miles west of El Vista; tidal about 10 miles above mouth; takes a very irregular course through heavily timbered land in upper drainage basin; in lower reaches the channel is wide, deep, and open.

HINES BRANCH.—Caldwell County; rises south of Tilmon; an intermittent stream flowing through Plum Creek to the San Marcos and thus to Guadalupe River. San Marcos topographic map.

HISAW CREEK.—Runnels County; northeast of Maverick in western part of county; small intermittent stream 8 miles long flowing through Valley Creek into the Colorado. Hayrick topographic map.

HITSON BRANCH.—Stephens County; a westward flowing stream 3 miles long joining Gonzales Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) 1½ miles southeast of Breckenridge. Breckinridge topographic map.

HITSON BRANCH.—Stephens County; a small stream rising 4 miles west of Caddo and flowing northerly 2 miles into Post Oak Branch (tributary through Little Cedar Creek to Big Cedar Creek and thus to Brazos River). Breckenridge topographic map.

HITSON CREEK.—Fisher and Stonewall counties; rises near Hitson in northeastern part of Fisher County; flows northerly 6 miles into Double Mountain Fork of Brazos River (which discharges into the Brazos) in southern part of Stonewall County. Roby topographic map.

HOG BAYOU.—Fort Bend County; a small stream about 1 mile long in southeastern part of county flowing southeasterly into Brazos River.

HOG BAYOU.—Panola County; rises about 3 miles northwest of Carthage; flows easterly 10 miles; empties into Sabine River a mile west of Pulaski.

HOG BRANCH.—Fayette County; northwest of Flatonia; small intermittent stream flowing into Big Fivemile Creek (tributary to Peach Creek and thus to Guadalupe River). Flatonia topographic map.

HOG BRANCH.—Stephens County; an intermittent stream rising near Double Mountain in southwestern part of county and flowing northwestward 8 miles into Sandy Creek (tributary to Hubbard Creek, thence through Gonzales Creek to Clear Fork of Brazos and Brazos rivers) near Buck Mountains. Breckenridge topographic map.

HOG CREEK.—Brown County; rises in the Hog Mountains 3 miles southeast of May in the northeastern part of the county; flows southwestward 12 miles into Pecan Bayou (tributary to Colorado River) 4 miles southeast of Byrd's store. Coleman and Brownwood topographic maps.

HOG CREEK.—Comanche and Eastland counties; rises 4 miles northeast of Desdemona in eastern part of Eastland County; flows southwestward 8 miles into Leon River (tributary through Little River to the Brazos) 3½ miles southwest of Desdemona in northern part of Comanche County. Eastland topographic map.

HOG CREEK.—Concho County; rises south of Paint Rock in northeastern part of county; flows 12 miles into Concho River (tributary to the Colorado). Ballinger and Eden topographic maps.

HOG CREEK.—Ellis County; small stream flowing through southwestern part of county into Mill Creek, thence through Pecan to Richland Creek and Trinity River.

HOG CREEK.—Erath County; an intermittent stream flowing northeasterly 3 miles into Little Green Creek (tributary to Green Creek, and thus through Bosque River to the Brazos) south of Alexander. Stephenville topographic map.

HOG CREEK.—Grayson County; a small intermittent stream flowing into Range Creek (tributary to Isle du Bois Creek, thence through Elm Fork of the Trinity to Trinity River) about 2 miles west of Ethel. Denison topographic map.

HOG CREEK.—Jasper County; a small intermittent stream flowing into Angelina River (tributary to Neches River) in northern part of county.

HOG CREEK.—McLennan, Bosque, and Coryell counties; rises near eastern corner of Hamilton County; flows southeasterly 36 miles into South Bosque River (tributary through Bosque River to the Brazos) 7 miles southwest of Waco in central part of McLennan County. Meridian and Waco topographic maps.

HOG CREEK.—Milam and Falls counties; rises near Lott in western part of Falls County; flows southeasterly 17 miles into Pond Creek (tributary to Brazos River) in northern part of Milam County.

HOG CREEK.—Runnels County; an intermittent stream west of Maverick in the western part of county; flows into Colorado River; length, 9 miles. Hayrick topographic map.

HOG CREEK.—Runnels County; flows through the town of Norwood in the southeastern part of the county; joins Mustang Creek (tributary to the Colorado); length, 6 miles. Ballinger topographic map.

HOG CREEK.—Shackelford County; a small stream flowing northwestward 5 miles into Clear Fork of Brazos River (which discharges into the Brazos) 10 miles north of Rising Sun in western part of county. Anson topographic map.

HOG MARSH.—Tom Green County; an intermittent stream flowing through the eastern part of the county into Lipan Creek and thus through the Concho into Colorado River; length, 17 miles. San Angelo topographic map.

HOLLAND CREEK.—Grimes County; rises north of Anderson; flows southwesterly into Navasota River (tributary to the Brazos) 3 miles north of the town of Navasota. Navasota topographic map.

HOLLIDAY CREEK.—Archer and Wichita counties; rises in northern part of Archer County; flows northeasterly 23 miles into Wichita River (tributary to Red River and thus to the Mississippi) in the southeastern part of Wichita County about 2 miles northeast of Wichita Falls.

HOLLIDAY CREEK.—Kendall County; a small stream rising southeast of Comfort and flowing into Guadalupe River.

HOLLINGS BRANCH.—Dallas and Tarrant counties; small stream flowing into Mountain Creek (tributary to West Fork of Trinity River and thus to the Trinity) southwest of Cedar Hill in southwestern corner of Dallas County and southeastern corner of Tarrant County. Fort Worth and Dallas topographic maps.

HOLLY CREEK.—Wood County; flows southerly 4 miles into Big Sandy Creek (tributary to Sabine River) in eastern part of county.

HOME CREEK.—Coleman County; rises 4 miles south of Glen Cove in western part of county; flows southeastward 30 miles into Colorado River 9 miles south of Trickham in the southeastern corner of the county. Ballinger, Coleman, and Brady topographic maps.

HOME CREEK.—Potter County; rises in north central part of county; flows southeasterly 7 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi).

HONEY CREEK.—Burnet County; connects with Hamilton Creek (tributary to the Colorado) 4 miles northeast of Fairland in the south central part of the county; length, 5 miles. Burnet topographic map.

HONEY CREEK.—Comal County; small stream southwest of Spring Branch in northwestern part of county; flows into Guadalupe River; intermittent.

HONEY CREEK.—Collin County; rises about 3 miles northeast of Roseland; flows southeasterly 13 miles into East Fork of Trinity River (tributary to Trinity River) about 3 miles north of McKinney.

HONEY CREEK.—Coryell County; rises at Purmela in northwestern part of county; flows easterly 5 miles into Mustang Creek (tributary through Leon River to Little River and thus to the Brazos). Gatesville topographic map.

HONEY CREEK.—Hamilton County; rises 2 miles west of Carleton; flows northeasterly 15 miles into Bosque River (tributary to the Brazos) 3 miles east of Hico in northeast corner of county. Hamilton and Meridian topographic maps.

HONEY CREEK.—Hunt County; rises about 4 miles south of Wolfe City in northern part of county; flows southeasterly 6 miles into South Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi).

HONEY CREEK.—Lavaca County; rises near Lavaca-Colorado county line; flows southwesterly 4 miles into Navidad River (tributary to Lavaca River and thence to Gulf of Mexico through Matagorda Bay) 2 miles northwest of Sublime.

HONEY CREEK.—Lamar County; rises about 4 miles southeast of Brookston in southern part of county; flows southeastward 8 miles into North Sulphur River (tributary to Sulphur River, which discharges into the Mississippi through Red River) in the southern part of the county at the southern boundary line.

HONEY CREEK.—Kerr County; small stream flowing into North Fork of Guadalupe River (tributary to the Guadalupe) northwest of Japonica in central part of county. Kerrville topographic map.

HONEY CREEK.—Llano County; rises near Pyramid Rock, 8 miles south of the town of Llano in the southern part of the county; flows eastward 12 miles into Llano River (tributary to the Colorado) 3 miles west of Kingsland. Llano and Burnet topographic maps.

HONEY CREEK.—Mason County; a tributary, through Llano River to the Colorado, flowing west of Mason through the central part of county; length, 14 miles. Mason topographic map.

HONEY CREEK.—Palo Pinto County; a small stream flowing southeasterly 8 miles into Palo Pinto Creek (tributary to Brazos River) 1 mile northwest of Coalville, in southwestern part of county. Palo Pinto topographic map.

HONEY GROVE CREEK.—Fannin County; rises 2 miles north of the town of Honey Grove in eastern part of county; flows northwesterly 8 miles into Bois d'arc Creek (tributary to Red River and thus to the Mississippi).

HONDO CREEK.—Bandera, Medina, and Frio counties; rises in the central part of Bandera County; flows southward and southeastward 10 miles through Bandera County, 40 miles through Medina County, thence 13 miles through Frio County into Frio River (tributary to Nueces River) southwest of Pearsall.

HONDO CREEK.—Bexar County; small stream north of Elmendorf in the southeastern part of the county; flows into Calaveras Creek (tributary to the Guadalupe through San Antonio River). San Antonio topographic map.

HONDO CREEK.—Karnes County; northeast of Green in the southern part of the county; flows into San Antonio River and thus to the Guadalupe.

HONDO CREEK.—Llano County; rises north of Oxford in southern part of county; flows southeastward 6 miles to its junction with Sandy Creek (tributary to the Colorado) 2 miles west of Potato Hill. Llano topographic map.

HOOPER CREEK.—Shelby County; rises in southwestern part of county; flows southwesterly 11 miles into Attoyac Bayou (tributary to Angelina River and thus to the Neches) near Grigsby.

HOPES CREEK.—Brazos County; rises 2 miles north of Welburn; flows southwestward 4 miles into Brazos River in southern part of county.

HORD CREEK.—Goliad County; rises in southwestern part of county; flows into San Antonio River and thus to the Guadalupe; very small.

HORDS CREEK.—Coleman County; rises 5 miles northwest of Glen Cove in the western part of county; flows easterly 35 miles through Coleman into Jim Ned Creek (tributary to Pecan Bayou and thus to the Colorado) a mile southwest of Camp Colorado in the central part of the county. Ballinger and Coleman topographic maps.

HORDS CREEK.—(North); Coleman County; rises north of the town of Coleman in north central part of county; flows 11 miles to its junction with Hords Creek and thus to Jim Ned Creek (tributary through Pecan Bayou to Colorado River). Ballinger and Coleman topographic maps.

HORNE BRANCH.—Hill County; rises 2 miles northeast of Woodbury in central part of county; flows southwestward 4 miles into Aquilla Creek (tributary to Brazos River). Cleburne topographic map.

HORNICA CREEK.—Motley County; small stream rising in northern part of county and flowing northeasterly into Pease River (tributary to Red River and thus to the Mississippi); length, 8 miles.

HORSE CREEK.—Brewster County; rises in eastern part about 9 miles northeast of Bullis Gap; flows southeasterly 7 miles into Maxon Creek tributary to San Francisco Creek, and thus to Rio Grande; intermittent. Bullis Gap and Indian Wells topographic maps.

HORSE CREEK.—Coleman County; a stream 6 miles long south of Santa Anna in the central part of the county; flows into Home Creek and thus to the Colorado. Coleman topographic map.

HORSE CREEK.—Donley County; a stream 3 miles long flowing southerly through east central part of county into Salt Fork of Red River, thence to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi.

HORSE CREEK.—Hemhill County; an intermittent stream 6 miles long flowing southerly into Canadian River (which discharges into the Mississippi through the Arkansas) 5 miles northwest of Canadian in northwestern part of county.

HORSE CREEK.—Hunt County; rises in north central part of county; flows southerly 9 miles into Cowleach Fork of Sabine River thence to Sabine River through Caddo Fork of the Sabine, about a mile east of Greenville.

HORSE CREEK.—Titus and Morris counties; rises in the northeastern part of Titus County; flows northeasterly 7 miles into Whiteoak Bayou (tributary to Sulphur River and thus to the Mississippi through Red River) in the northwestern part of Morris County.

HORSE CREEK.—San Saba County; small stream rising 9 miles north of San Saba in the northeastern part of the county; flows 5 miles into Colorado River. San Saba topographic map.

HORSE HOLLOW.—Fisher County; rises in southeastern part of county; flows into Sweetwater Creek (tributary to Clear Fork of Brazos River and thus to the Brazos); intermittent. Roby topographic map.

HORSE PEN CREEK.—Harris County; rises 3 miles south of Houston Hot Wells; flows southeasterly 5½ miles into Langhams Creek (tributary through Bear and Mayde Creeks to Buffalo Bayou and thus through Sabine, Trinity, and Galveston bays to Gulf of Mexico); intermittent. Cypress, Hillendahl, and Addicks topographic maps.

HORSE PEN BAYOU.—Harris County; rises 2 miles east of Olcott; flows easterly 5 miles into Middle Bayou and thus to Galveston Bay and Gulf of Mexico; partially intermittent. Genoa and Seabrook topographic maps.

Horse Pen Creek.—Tyler County; small stream southwest of Woodville in western part of county; joins Wood Creek (tributary to Alabama Creek and thus to Neches River) southwest of Warren.

Horse Thief Canyon.—Jeff Davis County; an intermittent stream; heads 6 miles east of Fort Davis in eastern part of the county; flows northeasterly 20 miles into Limpia Creek (tributary to Paisano Creek and thus through Pecos River to Rio Grande). Fort Davis topographic map.

Hot Spring Creek.—Presidio County; heads 10 miles northeast of Ruidosa in Tierra Vieja Mountains; flows southwestward into Rio Grande 4 miles north of Ruidosa; length, 11 miles; intermittent. San Carlos topographic map.

House Creek.—Coryell County; rises at Coperas Cove in southern part of County; flows northeasterly 10 miles to a point 7 miles northwest of Killeen, where it enters Cowhouse Creek, and thus to Leon, Little, and Brazos rivers. Gatesville topographic map.

House Mountain Branch.—Llano County; an intermittent stream 3 miles in length flowing into Hickory Creek (tributary to Llano River and thus to the Colorado) east of Starkes in the southwestern part of county. Llano topographic map.

Housing Bayou.—Sabine County; rises in western part of county; flows easterly 22 miles across the south central part of county into Sabine River.

Houston Creek.—Ellis County; joins Pecan Creek (tributary to Trinity River through Richland Creek) in southwestern part of county.

Howard Creek.—Bowie County; rises about 1 mile south of Nash in eastern part of county; flows southeasterly 6 miles into Hurricane Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 3 miles south of Texarkana. Texarkana topographic map.

Howards Creek.—Reagan. Crockett, and Val Verde counties; rises near county line of Crockett and Reagan counties about 30 miles north of the town of Ozona; flows in a southerly course to Ozona then southwesterly 45 miles into Pecos River (tributary to Rio Grande) 25 miles northwest of Langtry in extreme northwestern part of Val Verde County.

Huana Creek.—Shelby County; formed about 2 miles southwest of Center by the union of the North and South branches; flows southeasterly 4 miles into South Tancha Bayou (tributary to Tancha Bayou and thus to Sabine River) about 4 miles west of Shelbyville.

Huana Creek, North Fork.—Shelby County; rises about 11 miles northwest of Center; flows southeasterly 11 miles to its confluence with South Fork of Huana Creek forming Huana Creek (tributary to South Tancha Bayou, thus to Tancha Bayou and Sabine River), 2 miles southwest of Center.

Huana Creek, South Fork.—Shelby County; rises in southern part of county; flows northerly to its junction with North Fork of Huana Creek, forming Huana Creek, thence to South Tancha Bayou, Tancha Bayou, and Sabine River.

Hubbard Creek.—Stephens, Shackelford, and Callahan counties; rises at Baird in northern part of Callahan County; flows northeasterly 60 miles into Gonzales Creek (tributary to Clear Fork of Brazos River, and thus to the Brazos) 1 mile southeast of Crystal Falls. Albany and Breckenridge topographic maps.

Hubbard Creek.—West Fork of; Callahan County; rises near Admiral; flows northerly 12 miles into Deep Creek (tributary through Hubbard Creek to Gonzales Creek, thence through Clear Fork of Brazos River to the Brazos) 6 miles northwest of Bremen in northeastern part of county.

HUCKLEBERRY CREEK.—Hansford County; rises in northern part of county; flows northeasterly into Beaver River (tributary to North Fork of Canadian River and thus through Canadian and Arkansas rivers to the Mississippi) in southeastern part of Texas County, Okla.

HUCKLEBERRY CREEK.—Newton County; rises 3 miles north of Newton; flows southeasterly 8 miles; enters Caney Creek (tributary to Sabine River) about 6 miles southeast of Newton.

HUDSON BRANCH.—McCulloch County; a small stream flowing 4 miles to its junction with San Saba River (tributary to the Colorado) near camp San Saba in the southern part of the county. Brady and Mason topographic maps.

HUEBNER CREEK.—Bexar County; rises northwest of San Antonio; flows into Leon Creek (tributary to Medina River, and thus through San Antonio River to the Guadalupe); intermittent. San Antonio topographic map.

HUFFSTEADER CREEK.—Stephens and Young counties; a stream 6 miles long flowing southerly to its junction with Clear Fork of Brazos River (tributary to Brazos River) 2 miles southeast of southwest corner of Young County. Breckenridge topographic map.

HUGHES CREEK.—Cass County; rises 1 mile north of Hughes Springs in southwestern part of county; flows southeasterly 10 miles into Black Cypress Bayou (tributary through Big Cypress Bayou to Ferry Lake, thence to Caddo Lake and thus through Red River to the Mississippi) 4 miles northeast of Avinger.

HUNTING BAYOU.—Harris County; rises in the northern part of the city of Houston; flows easterly and southeasterly 12 miles into Ship Channel (Buffalo Bayou) thence to Galveston Bay and Gulf of Mexico, 2 miles northeast of Pasadena. Settegast, Fauna, and Deepwater topographic maps.

HUNTER BRANCH.—Cooke County; small stream flowing into Clear Creek (tributary to Elm Fork of Trinity River and thus to the Trinity) in southwestern part of county; intermittent. Gainesville topographic map.

HUNTS BRANCH.—Bastrop County; north of Smithville in the southeastern part of county; a small intermittent tributary to Colorado River; length, 5 miles. Bastrop topographic map.

HURRICANE BAYOU.—Houston County; rises about 7 miles east of Crockett; flows westerly 19 miles into Trinity River southeast of Malvern.

HURRICANE CREEK.—Anderson County; rises about 6 miles north of Palestine; flows southeasterly 15 miles into Neches River.

HURRICANE OR DAY CREEK.—Bowie County, Tex., and Miller County, Ark.; formed about 1½ miles south of Texarkana in eastern part of Bowie County, Tex., by union of Harris and Ward creeks; flows southeasterly 3 miles to its intersection of the Texas-Arkansas State line, thence 9 miles to its confluence with Sulphur River (tributary to Red River and thus to the Mississippi) in Miller County, Ark. Texarkana topographic map.

HURRICANE CREEK.—Cass County; rises about ½ mile southeast of Queen City in northeastern part of county; flows southward 7 miles into Black Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) near Arnold's sawmill, 4 miles northeast of Bivins.

HURRICANE CREEK.—Sabine County; small stream flowing into Housing Bayou, thence to Sabine Riber about 4 miles south of Hemphill.

HURST CREEK.—Travis County; small intermittent stream north of Bee Caves in the northwestern part of the county flowing into Colorado River; length, 5 miles. Austin topographic map.

IMPERIALSIT CREEK.—Kinney and Maverick counties; rises 6 miles south of Brackett; flows southerly about 26 miles into Rio Grande. Brackett topographic map.

INDEPENDENCE CREEK.—Terrell County; rises 18 miles southwest of Sheffield; takes a general southeasterly course about 18 miles; empties into Pecos River (tributary to Rio Grande) 15 miles south of Old Fort Lancaster and Sheffield; intermittent.

INDIAN CREEK.—Bexar County; an intermittent stream flowing southwest of the City of San Antonio and south of the town of Leon into Leon Creek. and thus through Medina and San Antonio rivers to the Guadalupe. San Antonio topographic map.

INDIAN CREEK.—Brown County; small stream in the southern part of the county west of the town of Indian Creek; flows into Colorado River; length, 10 miles. Coleman, Brownwood, and San Saba topographic maps.

INDIAN CREEK.—Coleman County; rises northeast of the town of Coleman; flows through the northwestern part of the county into Jim Ned Creek and thus to Pecan Bayou (tributary to Colorado River); length, 6 miles. Coleman topographic map.

INDIAN CREEK.—Comanche County; rises 2 miles northeast of Logan Gap in southern part of county; flows easterly 19 miles into Leon River (tributary through Little River to the Brazos) 2 miles northeast of Dingler; passes through Comanche. Brownwood and Hamilton topographic maps.

INDIAN CREEK.—Comal County; small stream in western part of county; flows into Rio Cibolo (tributary to San Antonio River and thus to the Guadalupe).

INDIAN CREEK.—Cooke County; rises about 6 miles east of Gainesville; flows southerly 18 miles into Isle du Bois Creek (tributary to Elm Fork of the Trinity, then to the Trinity). Gainesville topographic map.

INDIAN CREEK.—Collingsworth County; rises in central part; flows northerly 4 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of Red River and thus through the Red to the Mississippi).

INDIAN CREEK.—Denton County; tributary to Elm Fork of Trinity River (which discharges into Trinity River) in southwestern part of county.

INDIAN CREEK.—Donley and Hall counties; rises in southeastern part of Donley County; flows southeasterly 24 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) about 10 miles southwest of Salisbury in Hall County.

INDIAN CREEK.—Edwards County; an intermittent tributary; rises in the central part of the county; flows in southwesterly course to its junction with West Nueces River (tributary to Nueces River) about 2 miles below Ellis; length, 18 miles. Nueces topographic map.

INDIAN CREEK.—Erath County; rises at Bunkerhill; flows southerly 6 miles into Bosque River (tributary to Brazos River) 3 miles southwest of Selden in southern part of county. Stephenville topographic map.

INDIAN CREEK.—Fannin and Collin counties; rises near southwestern corner of Fannin County; flows southerly 7 miles into Bear Creek (tributary to Pilot Grove and thus through Sister Grove Creek to East Fork of Trinity River, then to the Trinity) about 3 miles east of Blue Ridge in Collin County.

INDIAN CREEK.—Gillespie County; in the southwestern part of the county; flows 4 miles into Scott Branch (tributary through Pedernales River to the Colorado). Kerrville topographic map.

INDIAN CREEK.—Grimes and Montgomery counties; rises in eastern part of Grimes County; flows southeasterly 3 miles through Grimes County, then 3 miles through Montgomery County into Lake Creek (tributary to West San Jacinto River), thence through San Jacinto River to the Gulf of Mexico.

INDIAN CREEK.—Jasper County; rises about 4 miles northwest of Jasper; flows westerly 9 miles into Angelina River (tributary to Neches River).

INDIAN CREEK.—Lavaca County; small stream rising east of Shiner and flowing southeasterly 4 miles into Rocky Creek (tributary to Lavaca River, thence to Matagorda Bay and Gulf of Mexico).

INDIAN CREEK.—Montgomery County; small tributary to Caney Creek (thence to Gulf of Mexico through East San Jacinto River and the San Jacinto) in northeastern part of county.

INDIAN CREEK.—Nacogdoches County; rises about 2 miles southeast of Socul in northwestern part of county; flows westerly 4 miles, joins Angelina River (tributary to Neches River) about one-half mile south of the Texas and New Orleans Railway crossing.

INDIAN CREEK.—Newton County; flows northerly 4 miles; empties into Buck Creek (tributary to Sabine River) a short distance above its mouth in northern part of county.

INDIAN CREEK.—Potter County; a stream 4½ miles long rising in northwestern part of county and flowing southerly into Canadian River (which discharges into the Mississippi through Arkansas River) 2 miles north of Amy.

INDIAN CREEK.—Shackelford County; rises 5 miles south of Albany; flows easterly 7 miles into Hubbard Creek (tributary to Gonzales Creek, thence through Clear Fork of Brazos River to the Brazos) south of McCatherine Mountain. Albany topographic map.

INDIAN CREEK.—Smith County; small stream 6 miles long flowing southwesterly into Neches River southwest of Tyler in the western part of county.

INDIAN CREEK.—Terrell County; rises in southwestern part, 1½ miles southwest of Taylor Ranch; flows southeasterly into Rio Grande; intermittent. Dryden Crossing topographic map.

INDIAN CREEK.—Uvalde County; an intermittent tributary in the "Canyon Country" north of Uvalde, about 5 miles east of Montell in western part of county; flows southerly 20 miles to its junction with Nueces River 2 miles below confluence of East and West Nueces rivers about 3 miles north of Hacienda. Uvalde topographic map.

INDIAN CREEK.—Wise and Tarrant counties; tributary to West Fork of Trinity River (which discharges into the Trinity) in the southeastern part of Wise and northwestern part of Tarrant counties. Fort Worth topographic map.

INDIAN CREEK.—Wood County; flows southerly 5 miles into Big Sandy Creek (tributary to Sabine River) in northeastern part of county.

INDIAN CAMP CREEK.—Erath County; rises 4 miles northeast of Stephenville; flows easterly 5 miles into Richardson Creek (tributary to Paluxy Creek and thus to Brazos River) near Sisk. Stephenville topographic map.

INGRANDO MARSH.—Harris County; 4½ miles southwest of Crosby in eastern part of county; drains easterly through Spring Gully and Granite Creek into San Jacinto River and thus to Gulf of Mexico. Harmaston topographic map.

IONI CREEK.—Anderson County; a stream flowing northeasterly into Neches River in the southeastern part of county; length, 13 miles.

IONI CREEK.—Palo Pinto County; rises near Stephens-Palo Pinto county line; flows northeasterly 23 miles into Brazos River 2 miles northwest of Wolf Mountain and 7 miles northwest of Palo Pinto in northwestern part of county. Breckenridge and Palo Pinto topographic maps.

IRISH CREEK.—De Witt County; small stream flowing into Guadalupe River 6½ miles southeast of Cuero in southeastern part of county.

IRON CREEK.—Hill County; a small intermittent stream rising 2 miles north of Prairie Valley; and flowing 4 miles into Brazos River in southern part of county. Waco topographic map.

IRON ORE CREEK.—Grayson County; rises about 6 miles northwest of Sherman in northern part of county; flows easterly 12 miles into Choctaw Creek (tributary to Red River and thus to the Mississippi) about 5 miles southeast of Denison. Denison topographic map.

IRON ROCK CREEK.—Blanco County; west of Westbrook in western part of county; small stream flowing into Pedernales River (tributary to Colorado River); length, 3 miles. Fredericksburg topographic map.

IRONS BAYOU.—Panola County; rises about 3 miles north of Clayton; flows northeasterly 14 miles into Sabine River 5 miles north of Carthage.

IRONS OR SPRING CREEK.—Waller County; rises 8 miles south of Hempstead; flows southerly 18 miles into Brazos River 6 miles east of Sealey in southwestern part of county.

IRWIN CREEK.—Throckmorton County; small stream flowing southwesterly 6 miles into Clear Fork of Brazos River (tributary to the Brazos) near Shackelford-Throckmorton county line 2 miles north of Fort Griffin. Albany topographic map.

ISINGLASS CANYON.—Terrell County; rises in southwestern part; flows southerly about 9 miles into Washboard Canyon (tributary to San Francisco Creek and thus to Rio Grande); intermittent. Indian Wells topographic map.

ISLAND CREEK.—Hill and Ellis counties; rises 3 miles northeast of Itasca, in northern part of Hill County; flows northeasterly 11 miles into North Fork of Pecan Creek (tributary to Pecan and Richland creeks, thence to Trinity River) in southern part of Ellis County. Cleburne topographic map.

ISLE DU BOIS CREEK.—Grayson, Cooke, and Denton counties; formed about 3 miles south of Collinsville, Grayson County, by the union of Range and Jordan creeks; flows southwesterly 14 miles into Elm Fork of Trinity River (tributary to the Trinity) about 5 miles northwest of Aubrey in Denton County. Denison topographic map.

IVANHOE CREEK.—Lipscomb County; an intermittent stream rising in northeastern part of county; flowing southeasterly into Oklahoma, joining Wolf Creek (tributary through North Fork of the Canadian to Canadian River, and thus through Arkansas River to the Mississippi) 6 miles west of Shattock, Okla.

JABALINA CANYON.—Terrell County; rises in southwestern part, 2½ miles west of Loma Vista; flows southerly 5 miles into Rio Grande; intermittent. Dryden Crossing topographic map.

JACK BAYOU.—Angelina County; small stream flowing into Cedar Creek (tributary to Neches River) in southwestern part of county.

JACKS BRANCH.—Hill County; rises 2 miles east of Woodbury in central part of county; flows southerly 7 miles into Aquilla Creek (tributary to Brazos River) 2 miles north of Vaughan. Cleburne and Waco topographic maps.

JACK BRANCH.—Val Verde County; an intermittent stream 4 miles long flowing southwestward into Ricardo Creek (tributary to Devils River, which discharges into Rio Grande).

JACKS BRANCH.—Stephens County; rises in the southwest corner of Stephens County; flows northerly 7 miles into Battle Creek (tributary to Bear Creek, and thus through Sandy, Hubbard, and Gonzales creeks to Clear Fork of Brazos River and thus to the Brazos) 4 miles southwest of Mankins Mill. Albany topographic map.

JACKSON BRANCH.—Dickens and Motley counties; rises in northern part of Dickens County; flows northeasterly 3 miles into South Pease River (tributary through Middle Pease to Pease River and thus through Red River to the Mississippi) in Motley County about one-half mile north of the southern boundary of the county.

JACKSON BRANCH.—San Saba County; small intermittent stream just east of the town of Cherokee in southern part of county; flows northerly to its junction with Cherokee Creek (tributary to Colorado River) 2 miles north of the town of Cherokee. Llano and San Saba topographic maps.

JACKSONS BAYOU.—Harris County; rises one-half mile west of Crosby; flows easterly and southeasterly 4 miles through Crosby into San Jacinto River and thus to Gulf of Mexico; partially intermittent. Crosby topographic map.

JACKSON BRANCH.—Throckmorton County; rises near southern Shackelford county line; flows northeasterly 3 miles into Clear Fork of Brazos River (tributary to the Brazos) 3 miles northwest of Fort Griffin. Albany topographic map.

JACKSON CREEK.—Fayette County; east of Roundtop in northern part of county; tributary through Cummins Creek to Colorado River; length, 7 miles.

JACKSON CREEK.—Panola County; formed in the northwestern part of the county by the union of Rogers and Tuttle creeks; flows southwesterly about 6 miles into Sabine River.

JACKSON CREEK.—Washington County; rises 8 miles northeast of Gay Hill; flows southeasterly 13 miles into Brazos River about 5 miles north of Houston & Texas Central Railroad crossing.

JACKSON LAKE.—Falls County; 5 miles northeast of Chilton, just west of Brazos River in northern part of county; length, about 2 miles; maximum width, one-half mile. Temple topographic map.

JACK JOHN CREEK.—Fayette County; 3½ miles northeast of Muldoon in the central part of the county; intermittent tributary through Buckners Creek to Colorado River; length, 5 miles. Flatona topographic map.

JACOBS BRANCH.—Hood County; rises in northern part of county 1½ miles southwest of Center Mill; flows westerly 1½ miles into Brazos River. Weatherford topographic map.

JACOBS CREEK.—Comal County; near Hancock in northeastern part of county; small intermittent stream flowing into Guadalupe River.

J. HALL CREEK.—Motley County; rises about 4 miles northeast of Lyman in western part of county; flows northeasterly 3 miles into Cottonwood Mott Creek (tributary through Middle Pease River to Pease River and thus through Red River to the Mississippi).

JAHUEY CREEK.—Zavalla, Frio, and Lasalle counties; rises 5 miles southeast of Loma Vista in the southeastern part of Zavalla County; flows southeasterly 5 miles through Frio County, then 28 miles through Lasalle County into Frio River (tributary to the Nueces) 5 miles northeast of Dull; length, 38 miles.

JAKES CREEK.—Red River County; rises about 5½ miles northeast of Clarksville; flows southerly 5½ miles into Gragg Creek (tributary to Kickapoo Creek, thence to Cuthand Creek and thus through Sulphur and Red rivers to the Mississippi).

JAMES RIVER.—Kimble and Mason counties; rises south of Noxville in the southeastern part of Kimble County; flows northeasterly 15 miles through Kimble County, then 22 miles through Mason County to its junction with Llano River (tributary to the Colorado) 7 miles south of Mason in the central part of Mason County; south of a point near the Mason-Kimble county line the river forks, forming what is known as East and West Fork of James River. Kerrville and Mason topographic maps.

JANE CREEK.—Dewitt County; small stream in southern part of county; flows into Coleto Creek and thus to the Guadalupe.

JARBO BAYOU.—Galveston County; a small tidal stream tributary to Clear Lake (thence to Galveston Bay and Gulf of Mexico) in the northern part of the county.

JASPER OR HOG CREEK.—Wise and Jack counties; joins West Fork of Trinity River and thus to the Trinity in the southeastern part of Jack County and southwestern part of Wise County.

JENNINGS LAKE.—Cass County; about one-half mile north of Jennings Lake Switch in northwestern part of county; an "old channel lake" formed by former channel of Sulphur River; inlet, Fleming Creek; outlet, Sulphur River (tributary to Red River and thus to the Mississippi). Daingerfield topographic map.

JERRY CREEK.—Caldwell County; northeast of Lockhart in the northern part of the county; small intermittent stream; flows into Dry Creek and thus through Plum Creek and San Marcos River to the Guadalupe. San Marcos topographic map.

JESSE ARROYO.—Donley County; a stream 9 miles long flowing northeasterly through eastern part of county into Salt Fork of Red River (tributary to Prarie Dog Town Fork of Red River and thus through the Red to Mississippi River).

JIM BAYOU.—Cass and Marion counties; rises in southern part of Cass County about 1 mile west of Linden; flows southeasterly 24 miles into Caddo Lake (thence to Red River and thus to the Mississippi) in northeastern part of Marion County near the State boundary.

JIM JOHN CREEK.—San Saba County; a stream 2 miles long in the southeastern corner of county; tributary to Colorado River. Burnet topographic map.

JIM LITTLE CREEK.—Kimble County; a small stream in southeastern part of county; flows 10 miles joining James River and thus through the Llano to Colorado River.

JIM NAIL BRANCH.—Eastland County; flows southwesterly 4 miles to its junction with Leon River (which discharges into the Brazos through Little River) 6 miles southeast of Merriman in central part of county. Eastland topographic map.

JIM NED CREEK.—Taylor, Coleman, and Brown counties; rises 7½ miles southeast of Buffalo Gap in the southeastern part of Taylor County; flows southeasterly 20 miles through Taylor County, 34 miles through Coleman County, then 17 miles through Brown County into Pecan Bayou (tributary to Colorado River) 9 miles north of Brownwood in the central part of Brown County. Abilene and Coleman topographic maps.

JIMMYS CREEK.—Comanche County; small stream flowing northeasterly 8 miles into South Copperas Creek (tributary to Copperas Creek, thence through Leon River to Little River and thus to the Brazos) 5 miles south of Sipe Springs. Brownwood topographic map.

JOBS CREEK.—San Saba County; an intermittent tributary to San Saba River in the western part of county west of San Saba; lengh, 10 miles. San Saba topographic map.

JOE BEATTY CREEK.—Armstrong County; rises in southwestern part of county; flows northeasterly 2 miles into Prairie Dog Town Fork of Red River (tributary to Red River, which discharges into the Mississippi).

JOHN CREEK.—Potter County; a small stream flowing northwesterly through central part of county into Canadian River (tributary to Arkansas River and thus to the Mississippi); length, 4 miles.

JOHNS CREEK.—Cass County; rises about 4 miles east of Douglasville in northern part of county; flows southward 14 miles into Frazier Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) about 7 miles east of Linden.

JOHNS CREEK.—Delta County; rises about 8 miles northwest of Cooper in western part of county; flows southeasterly 12 miles into South Sulphur River (tributary to Sulphur River, which discharges into the Mississippi through Red River) at the southern boundary of the county.

JOHNS CREEK.—Victoria County; small tributary in western part of county; flows through Cottonwood Creek into Coleto Creek and thus to the Guadalupe.

JOHNSON CREEK.—Kerr County; rises north of Mountain Home in northern part of county; flows southeasterly 19 miles into Guadalupe River at Ingram. Kerrville topographic map.

JOHNSON CREEK.—Llano County; rises 5 miles east of Field Creek in the northwestern part of the county; flows southeastward 15 miles into Llano River (tributary to Colorado River) 3 miles west of Llano. Llano topographic map.

JOHNSON CREEK.—Marion County; rises in western part of county; flows southerly 7 miles into Big Cypress Bayou, thence to Caddo Lake, and thus through Red River to the Mississippi.

JOHNSON CREEK.—Rusk and Cherokee counties; rises in northwestern part of Rusk County; flows southwesterly 19 miles into Striker Creek (tributary through Angelina River to the Neches) in southeastern part of Cherokee County.

JOHNSON CREEK.—Tarrant and Dallas counties; rises at Johnson station in eastern part of Tarrant County; flows northeasterly 9 miles into West Fork of Trinity River (tributary to the Trinity) 1½ miles northwest of Grand Prairie in the eastern part of Dallas County. Fort Worth topographic map.

JOHNSON CREEK.—Dewitt County; small stream in southwestern part of county; flows into Manahuilla Creek and thus through San Antonio River to the Guadalupe.

JOHNSONS CREEK.—Young County; small stream flowing eastward 3 miles into Brazos River 1 mile south of Bellknap in central part of county.

JOHNSONS LAKE.—Haskell County; 10 miles north of the village of Haskell in northern part of county; outlet, Lake Creek (tributary through Millers Creek to Brazos River).

JOHNSONS RUN.—Crockett and Val Verde counties; rises 10 miles north of the town of Ozona in central part of county; flows southerly 35 miles to the Val Verde County line, then southeasterly about 16 miles to Devils River (tributary to Rio Grande); intermittent.

JONAH CREEK.—Collingsworth, Hall, and Childress counties; rises in Collingsworth County about 2½ miles northeast of the southwestern corner of Collingsworth County; flows southeasterly 22 miles into Prairie Dog Town Fork of Red River (tributary through Red River to the Mississippi) in northwestern part of Childress County.

JONES CREEK.—Brazos County; rises in southern part; flows southeastward 4 miles into Navasota River (tributary to Brazos River) northeast of Millican. Navasota topographic map.

JONES CREEK.—Brazoria County; small stream flowing southerly in the southern part of the county into a small lake (unnamed) and thus to the Gulf of Mexico.

JONES CREEK.—Bowie County; a small intermittent stream rising about 4 miles southeast of Redwater, and flowing to Kelley Creek (tributary to Sulphur River, and thus through Red River to the Mississippi). Texarkana topographic map.

JONES CREEK.—Bowie County; rises about 2 miles southwest of Leary in eastern part of county; flows northerly into Big Creek, which discharges into the Mississippi through Red River. Texarkana topographic map.

JONES CREEK.—Hunt County; rises about 3 miles west of Wolfe City, near northern boundary of county; flows southeasterly 4 miles into South Sulphur River, thence to Sulphur River, which discharges into the Mississippi through Red River.

JONES CREEK.—Montague County; an intermittent stream flowing into Big Sandy Creek (tributary through West Fork of Trinity River to the Trinity) south of Bowie in the southwestern part of the county. Montague topographic map.

JONES CREEK.—Motley County; rises about 2 miles north of Lyman in western part of county; flows northeastward 4 miles into Cottonwood Mott Creek (tributary to Middle Pease River, and thus through Pease and Red rivers to the Mississippi).

JONES CREEK.—Wharton County; a small tributary to Colorado River south of Wharton in the southern part of the county; length, 20 miles.

JONES VALLEY.—Montague County; small area draining into Denton Creek (tributary to Elm Fork of Trinity River and thus to the Trinity) about 3 miles east of Denver. Montague topographic map.

JORDAN CREEK.—Grayson County; rises at Whitesboro; flows southerly 11 miles to its confluence with Range Creek, about 3 miles south of Collinsville, forming Isle du Bois Creek (tributary through Elm Fork of Trinity River to the Trinity). Denison topographic map.

JORDAN CREEK.—Kent County; rises near Kent-Dickens county line; flows southwesterly 4 miles into Duck Creek (tributary to Salt Fork of the Brazos, and thus to the Brazos) near Girard in northern part of county.

JORDAN GULLEY.—Harris County; rises one-third of a mile east of Humble; flows northeasterly 2½ miles through Moonshine Hill into San Jacinto River and thus to Gulf of Mexico; partially intermittent. Harmaston and Moonshine Hill topographic maps.

JORDAN CREEK.—Jasper County; small stream flowing into Indian Creek (tributary to Angelina and Neches rivers) in northwestern part of county.

JORDAN CREEK.—Washington County; rises 2½ miles south of Old Washington; flows northeasterly 3 miles into Brazos River in northeastern part of county. Navasota topographic map.

JOSHUA CREEK.—Kendall County; small stream in western part of county flowing southwest of Sisterdale into Guadalupe River.

JOSHUA CREEK, EAST FORK.—Kendall County; headwater stream of Joshua Creek (tributary to Guadalupe River) southwest of Sisterdale in western part of county.

JOSHUA CREEK, WEST FORK.—Kendall County; southwest of Sisterdale in western part of county; headwater stream joining East Fork of Joshua Creek to form Joshua Creek (tributary to Guadalupe River).

JOTENA CREEK.—Webb County; a small stream in southeastern part of county flowing northwestward 8 miles into Prieto Creek (tributary to the Nueces).

JOURNIGAN CREEK.—Delta County; rises near the intersection of Fannin, Hunt, and Delta county boundary line; flows southeasterly 11 miles into Middle Fork of Sulphur River (tributary to South Sulphur River and thus through Sulphur and Red rivers to the Mississippi).

JOURNIGAN CREEK, WEST FORK OF.—Fannin, Hunt, and Delta counties; rises in southeastern part of Fannin County; flows southeasterly 9 miles into Journigan Creek (tributary to Middle Fork of Sulphur River, thence through South Sulphur River to Sulphur River and thus through Red River to the Mississippi) in southwestern part of Delta County.

JUANITO CREEK.—Matagorda County; small tributary to Tres Palacios Creek (thence to Matagorda Bay and thus to Gulf of Mexico) in western part of the county; flows southeasterly 2 miles.

JUG CREEK.—Irion and Tom Green counties; small intermittent stream; rises in northeastern part of Irion County; flows southward joining Middle Concho River (tributary through South Concho and Concho Rivers to the Colorado) 4 miles southeast of Arden in the western part of Tom Green County. Sherwood topographic map.

KAOLIN CREEK.—Uvalde County; small intermittent tributary to Dry Frio River near Kelly ranch. Uvalde topographic map.

KARANKAWA BAYOU.—Galveston County; rises in the southwestern part of the county; flows southeasterly 3 miles into Karankawa Lake, West Galveston Bay, and thus to Gulf of Mexico.

KATE CREEK.—Borden and Howard counties; in the northern part of Howard and southern part of Borden County; flows into Colorado River; length, 10 miles.

KATEMCY CREEK.—Mason and McCulloch counties; rises 4 miles south of Katemcy in the northern part of Mason County; flows northward 11 miles into San Saba River (tributary to the Colorado) at Camp San Saba in the southeastern part of McCulloch County. Mason topographic map.

KEE BRANCH.—Tarrant County; a small stream flowing into Rush Creek (tributary to Village Creek, and thus through West Fork of Trinity River to the Trinity) north of Kennedale. Fort Worth topographic map.

KEECHEY OR KEECHI CREEK.—Anderson County; rises about 5 miles northwest of Palestine; flows southwesterly 12 miles into Trinity River about 3 miles west of Douglass.

KEECHI CREEK.—Leon County; rises about 1 mile northeast of Robbins; flows northeasterly, easterly, and southeasterly 29 miles into Trinity River at Cairo.

KEECHIE CREEK, EAST FORK.—Jack and Palo Pinto counties; rises in southern part of Jack County near Perrin; flows southwesterly into Keechie Creek (tributary to Brazos River) 1 mile northwest of Graford in northeastern part of Palo Pinto County. Palo Pinto topographic map.

KEECHIE CREEK.—Palo Pinto and Jack counties; rises 5 miles south of Jacksboro in southern part of Jack County; flows southerly 22 miles into Brazos River 5 miles south of Graford in northern part of Palo Pinto County. Palo Pinto topographic map.

KEENER CREEK.—Llano County; small intermittent stream flowing into Crabapple Creek (tributary to Sandy Creek and thus to Colorado River). Llano topographic map.

KELLOG CANYON.—Brewster County; heads in eastern part about 4½ miles southwest of Bullis Gap; flows northeasterly 12 miles through Bullis Gap and Cedar Gap into San Francisco Creek and thus to Rio Grande; intermittent. Bullis Gap topographic map.

KELSEY CREEK.—Upshur County; rises in the western part of county; flows eastward 13 miles to a point about 4 miles north of Gilmer, where it enters Little Cypress Creek, thence to Caddo Lake, and thus through Red River to the Mississippi.

KELLEY CREEK.—Bowie County; rises about 3½ miles south of Clem; flows easterly 5 miles into Sulphur River (tributary through Red River to the Mississippi) about 5 miles southeast of Redwater in southern part of county. New Boston and Texarkana topographic maps.

KELLEY CREEK.—Kerr County; tributary to Guadalupe River southeast of Japonica in the central part of the county. Kerrville topographic map.

KELLEY CREEK.—Morris and Cass counties; rises at Naples in northern part of Morris County; flows southeasterly 15 miles into Black Cypress Bayou (tributary to Big Cypress Bayou, which discharges into Caddo Lake and thus through Red River to the Mississippi) 6½ miles northeast of Hughes Springs in southwestern part of Cass County. Daingerfield topographic map.

KELLY CREEK.—Donley County; west central part; flows northeasterly 6 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of Red River, which discharges into Mississippi River through the Red) about 4½ miles north of Clarendon.

KENO OR GOLD CREEK.—Dawson and Borden counties; rises south of Michies in the eastern part of Dawson County; flows easterly about 16 miles into Colorado River in the southwestern part of Borden County.

KERR CREEK.—Angelina County; a stream 4 miles in length flowing northwesterly into Angelina River (tributary to Neches River) in the northwestern part of county.

KERR CREEK.—Gonzales County; east of the town of Gonzales; small intermittent tributary to Guadalupe River. Flatonia topographic map.

KEYSER CREEK.—Mason County; an intermittent tributary to Llano River (thence to the Colorado) flowing southwest of Castell in the eastern part of the county; length, 7 miles. Mason and Llano topographic maps.

KICKAPOO CREEK.—Baylor and Archer counties; rises in southeastern part of Baylor County about 1 mile from Baylor-Archer county line; flows northeasterly 17 miles into North Fork of Little Wichita River (tributary through Little Wichita River to Red River and thus to the Mississippi) in western part of Archer County.

KICKAPOO CREEK.—Coke and Runnels counties; an intermittent stream flowing southerly 12 miles along Coke-Runnels county line; joins Colorado River 3½ miles west of Maverick in the western part of Runnels County. Hayrick topographic map.

KICKAPOO CREEK.—Edwards County; a small intermittent tributary in the southern part of county; unites with West Nueces River (thence to the Nueces) at Kickapoo Springs; flows southwesterly 4 miles. Nueces topographic map.

KICKAPOO CREEK.—Harris County; rises in northwestern part of county 2½ miles north of Waller; flows easterly 4½ miles into Spring Creek (tributary to San Jacinto River, thence to Galveston Bay and Gulf of Mexico); intermittent.

KICKAPOO CREEK.—Parker, Hood, and Palo Pinto counties; rises 4 miles west of Lipan in southern corner of Palo Pinto County; flows northerly 18 miles into Brazos River a mile southeast of Buckner, in southwestern corner of Parker County. Stephenville, Palo Pinto, and Weatherford topographic maps.

KICKAPOO CREEK.—Red River County; rises about 4 miles northeast of Annona in eastern part of county; flows southerly 12 miles into Cuthand Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 9 miles south of Annona in southern part of county.

KICKAPOO CREEK.—Schleicher, Tom Green, and Concho counties; rises in the northeastern corner of Schleicher County at an approximate altitude of 2,400 feet above sea level; flows northeastward 38 miles into Concho River (tributary to the Colorado) 2 miles west of Paint Rock in the northwestern part of Concho County; drainage, area, 310 square miles. San Angelo, Eden, and Ballinger topographic maps.

KICKAPOO CREEK.—Trinity and Polk counties; rises in the southeastern part of Trinity County; flows southerly and westerly 10 miles through Trinity County, then 16 miles through Polk County into Trinity River east of Pointblank.

KICKAPOO CREEK.—Van Zandt and Henderson counties; rises about 6 miles south of Canton in Van Zandt County; flows southeasterly 32 miles into Neches River in Henderson County about 6 miles southwest of Chandler.

KICKAPOO CREEK, WEST FORK, OR ALLIGATOR CREEK.—Van Zandt County; rises south of Canton in the southwestern part of the county; flows southwesterly 7 miles into Kickapoo Creek (tributary to Neches River).

KICKAPOO CREEK, EAST FORK.—Van Zandt and Henderson counties; rises southeast of Canton in southern part of Van Zandt County; flows southerly 11 miles into Kickapoo Creek (tributary to Neches River) near the Van Zandt and Henderson county line.

KILDOOGAN CREEK.—Fisher and Nolan counties; an intermittent stream 9 miles long flowing southeasterly into Sweetwater Creek (tributary through Clear Fork of Brazos River to the Brazos) 4 miles east of the village of Sweetwater in northern part of Nolan County. Roby topographic map.

KILFOIL DRAW.—Donley County; rises in southeastern part of county; flows northeastward 7½ miles into Lake Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red and the Red to Mississippi River) about 2 miles southeast of Lelia.

KILGORE CREEK.—Goliad County; small stream northeast of Goliad in northeastern part of county; flows through Perdido Creek to Coleto Creek and thus to the Guadalupe.

KIMBLE CREEK.—Hunt County; rises about 2 miles south of Greenville; flows southerly 10 miles into Beane Creek, thence to Caddo Fork of Sabine River (tributary to the Sabine).

KING CREEK.—Mills County; a small stream 6 miles long east of Regency in the southwestern part of the county; flows into Colorado River. Brownwood and San Saba topographic maps.

KINCAID CREEK.—Brewster County; rises in northeastern part about 6 miles southwest of Gage ranch; flows easterly into Bear Creek tributary to Rio Grande; intermittent. Hood Spring and Dove Mountain topographic maps.

KINGS BRANCH.—Cass County; rises at Munz in northern part of county; flows northeasterly 3½ miles into Caney Creek (tributary to Sulphur River and thus through Red River to the Mississippi); intermittent. Linden topographic map.

Kings Creek.—Throckmorton and Shackelford counties; a stream flowing southeasterly 7 miles into Clear Fork of Brazos River (tributary to Brazos River) 1 mile north of the southeast corner of Throckmorton County. Albany and Breckenridge topographic maps.

Kings Fork of Cedar Creek.—Kaufman County; rises in northern part of county; flows southerly 20 miles into Cedar Creek (tributary to Trinity River) about 3 miles southwest of Kaufman.

Kiowa Creek.—Knox and Baylor counties; rises in northeastern part of Knox County; flows southeastward into South Wichita River (tributary through Wichita to Red River and thus to the Mississippi) in northwestern part of Baylor County.

Kirkendall Hollow.—Erath County; a small intermittent stream south of Dublin in southern part of county; flows southerly into Resley Creek (tributary to Leon River, and thus through Little River to the Brazos); length, 3 miles. Stephenville topographic map.

Kit Carson Creek.—Moore and Hutchinson counties; rises near the line of Moore and Hutchinson counties; flows southeasterly 17 miles into Canadian River (which discharges into the Mississippi through Arkansas River) 10 miles west of Plemons in western part of Hutchinson County; intermittent.

Klein Branch.—Gillespie County; small stream joining Pedernales River (tributary to the Colorado) 3 miles northeast of Harper in the southwestern part of the county; length, 4 miles. Kerrville topographic map.

Knights Branch.—Dallas County; small stream flowing into Trinity River northwest of Dallas. Dallas topographic map.

Knobbs Creek.—Lee and Fayette counties; tributary through Rabbs Creek to Colorado River, in the [illegible] part of Fayette County and the southern part of Lee County; length, 9 miles. Bastrop topographic map.

Knox Branch.—Shackelford and Throckmorton counties; a southwestward flowing stream joining Clear Fork of Brazos River (tributary to the Brazos) 1 mile north of Fort Griffin, in northern part of county; length, 2½ miles. Albany topographic map.

Kuykendalls Creek.—Washington County; rises 2 miles east of Gay Hill; flows southeasterly 10 miles into New Years Creek (tributary to Brazos River) 5 miles north of Chappel Hill.

Lacy Creek.—Titus County; rises in northeastern part; flows southeasterly 5 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

Lacys Fork of Cedar Creek.—Van Zandt and Kaufman counties; rises about 2 miles west of Canton in Van Zandt County; flows southwesterly 23 miles to a point near Gossett close to its intersection of south Kaufman County line, where it enters Cedar Creek (tributary to Trinity River).

Laguna Grande.—Dallam County; northeast of Corlena in northwestern part of county in Rabbit Ear Creek drainage.

Lagunillas Creek.—Atascosa and McMullen counties; rises in western part of Atascosa County; flows southeastward 20 miles through Atascosa County and 1 mile through McMullen County into San Miguel Creek (tributary to Frio and Nueces rivers); length, 21 miles.

Lake Creek.—Anderson County; small tributary to Trinity River is western part of county.

Lake Creek.—Collingsworth County; a stream 5 miles long rising in central part of county and flowing into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

LAKE CREEK.—Delta County; a small stream in eastern part of county flowing southeasterly 9 miles into South Sulphur River, thence to Sulphur River and thus through Red River to the Mississippi.

LAKE CREEK.—Donley County; rises about 4 miles southeast of Clarendon; flows northeasterly 15 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi River).

LAKE CREEK.—Grimes and Montgomery counties; rises in northeastern part of Grimes County; flows southeasterly 10 miles through Grimes County, then 33 miles through Montgomery County into West San Jacinto River (tributary to San Jacinto River and thus to Galveston Bay and Gulf of Mexico) south of Conroe.

LAKE CREEK.—Haskell, Baylor, and Knox counties; rises in northern part of Haskell County; flows northeasterly into Millers Creek (tributary to Brazos River) in southern part of Baylor County.

LAKE CREEK.—Palo Pinto County; rises 4 miles southwest of Metcalf Gap in southwestern part of county; flows easterly 15 miles into Palo Pinto Creek (tributary to Brazos River) 5 miles north of Coalville. Palo Pinto topographic map.

LAKE CREEK.—Williamson County; small stream joining Brushy Creek (tributary to San Gabriel River, thence through Little River to the Brazos) southeast of the village of Round Rock in southern part of county. Georgetown and Austin topographic maps.

LAKE ERIE CANYON CREEK.—Hall County; rises in central part; flows northward three miles into Little Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

LAKE FORK OF SABINE RIVER.—See Sabine River, Lake Fork of.

LAKE HOLLOW.—Schleicher County; a small intermittent stream 4 miles long rising in the southeastern part of the county and flowing through North Valley into San Saba River (tributary to the Colorado). Fort McKavett topographic map.

LAKE JANE.—Fort Bend County; 5 miles northeast of Richmond in Oyster Bayou drainage (Brazos River drainage); very small.

LAKE LEOLA.—Donley County; about a mile northwest of Clarendon; when overflowing, tributary to Clarendon Lake (which discharges into Little Brushy Creek, thence to Salt Fork of Red River and thus through Prairie Dog Town Fork of Red River to Red and Mississippi rivers); small.

LAKE VALLEY CREEK.—Jack County; stream flowing through northwestern part of county into West Fork of Trinity River (tributary to the Trinity) south of the town of Antelope.

LAMBS CREEK.—Limestone and Freestone counties; rises in the southern corner of Freestone County; flows southwesterly 7 miles into Sanders Creek (which discharges into Brazos River through the Navasota) in the southeast corner of Limestone County.

LAMBS HEAD CREEK.—Throckmorton and Shackelford counties; rises 2 miles northeast of Antelope Hills, in northern part of Shackelford County; flows northeasterly 7 miles into Clear Fork of Brazos (tributary to the Brazos) 5 miles north of Fort Griffin in southern part of Throckmorton County. Albany topographic map.

117992°—19—WSP 448——9

LAMPASAS RIVER.—Hamilton, Lampasas, Burnet, and Bell counties; rises about 4 miles north of McGirk, in western part of Hamilton County, at an approximate altitude of 1,600 feet above sea level; flows southeasterly 100 miles, uniting with Leon River 7 miles southeast of Belton in central part of Bell County to form Little River (tributary to the Brazos). Hamilton, Lampasas, Gatesville, Georgetown, Temple, and Taylor topographic maps.

LAMPTON CREEK.—Donley County; small stream in eastern part of county flowing into Red Mud Creek (tributary to McCormick Creek, thence to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red to Red and Mississippi rivers).

LANDERS BRANCH.—Cooke County; a small stream rising about 4 miles southeast of Marysville in northern part of county and flowing into South Fish Creek, thence to Fish Creek and thus through Red River to the Mississippi. Gainesville topographic map.

LANG CREEK.—Mason and Llano counties; a stream flowing south of Castell in the eastern part of Mason County, then through western Llano County into Llano (tributary to Colorado River); length, 6 miles. Llano topographic map.

LANGHAM CREEK.—Harris County; rises in western part of county 4½ miles southwest of Cypress; flows southeasterly 11 miles into Bear Creek (tributary to Mayde Creek, thus to Buffalo Bayou, thence through San Jacinto, Trinity, and Galveston bays, to Gulf of Mexico); intermittent. Cypress, Addicks, and Hillendahl topographic maps.

LANGUM OR BIG CREEK.—Bowie County; rises about one-half mile south of New Boston near center of county; flows southeasterly 21 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) about 6 miles southeast of Redwater; near its mouth it connects with Elliott Creek by overflow channel. New Boston and Texarkana topographic maps.

LA PARITA CREEK.—Atascosa County; rises near Charlotte in western part of county; flows southeasterly 30 miles into Atascosa River (tributary to the Nueces through Frio River) about 3 miles northwest of Whitsett.

LARRISON CREEK.—Cherokee County; rises in southeastern part of county; flows southerly into Neches River in southeastern part of county; length, 15 miles.

LARRISONS CREEK.—Madison County; rises in northern part of county; flows southeasterly 20 miles into Bidais Creek (tributary to Trinity River).

LAS MORAS CREEK.—Kinney and Maverick counties; rises 4 miles north of Brackett; flows southwesterly 29 miles into Rio Grande; partially intermittent. Brackett topographic map.

LAS MORAS (HOWARDS CREEK).—Menard County; a small stream flowing 12 miles to its junction with San Saba River (tributary to the Colorado) near Menard in central part of the county.

LAS RAICES CREEK.—Lasalle County; small tributary in western part of county; flows eastward to its junction with Nueces River near the center of the county.

LATHAM CREEK.—San Saba County; in eastern part of county; tributary through Wallace Creek to San Saba River and thus to the Colorado; length, 7 miles. San Saba topographic map.

LAVACA RIVER.—Fayette, Lavaca, Jackson, and Calhoun counties; rises in southwestern corner of Fayette County, about midway between Flatonia and Moulton; flows southeastward 40 miles through Lavaca County, 34 miles through Jackson County, then 3 miles through Calhoun County into Lavaca Bay, and thus to Matagorda Bay and Gulf of Mexico, northeast of Port Lavaca. Flatonia topographic map.

LAVELLS LAKE.—Jefferson County; 2 miles north of LaBelle in central part of county; formation similar to river channel; lake approximately 6 miles long.

LAWZ CREEK.—Webb and Zapata couuties; small intermittent stream flowing southerly about 4 miles into San Juanita Creek (tributary to Rio Grande).

LEGARTO CREEK.—McMullen, Jim Wells, and Live Oak counties; rises 6 miles east of Lomo Alto in McMullen County; flows southeasterly into Jim Wells County, then northeasterly into Live Oak County into Nueces River near Legarto; length, 35 miles.

LEGION CREEK.—Llano County; a small stream flowing 6 miles to its junction with Sandy Creek a mile west of Lone Mountain, and thus to Colorado River in the southern part of the county. Fredericksburg and Llano topographic maps.

LEHEY CREEK.—Potter County; a stream rising in northern part of county and flowing southerly 3½ miles into Canadian River (tributary to Arkansas River and thus to the Mississippi).

LEMM GULLY.—Harris County; rises near Spring in northwestern part of county; flows southerly 3½ miles into Cypress Creek; intermittent. Spring topographic map.

LENTZ BRANCH.—Bastrop County; small stream rising 3 miles southeast of Redrock in the western part of county; flows northward 7 miles joining Walnut Creek (tributary to Colorado River) 3 miles east of Otis. Flatonia and Bastrop topographic maps.

LEON CREEK.—Bexar County; rises in northwestern part of county; flows southerly 40 miles into Medina River (tributary through San Antonio River to the Guadalupe) south of San Antonio. San Antonio topographic map.

LEON CREEK.—Victoria County; rises in northeastern part of county; flows eastward into Arenosa Creek and thus to Lavaca and Matagorda bays and Gulf of Mexico.

LEON RIVER.—Eastland, Comanche, Hamilton, Coryell, and Bell counties; about 2 miles southeast of Eastland, in northern part of Eastland County, formed by confluence of North and Middle Forks of Leon River; flows southeasterly 185 miles to its junction with Lampasas River to form Little River (tributary to the Brazos) in cenral part of Bell County, 7 miles southeast of Belton; principal towns along this stream are, Belton, Gatesville, and Eastland. Eastland, Stephenville, Hamilton, Meridian, Gatesville, Temple, and Taylor topographic maps.

LEON RIVER, MIDDLE FORK.—Eastland County; this fork may be considered the continuation of the main stream; rises 2½ miles east of Cisco; flows eastward 11 miles to its junction with North Fork Leon River, forming Leon River (tributary through Little River to the Brazos) 2 miles southeast of the town of Eastland. Eastland topographic map.

LEON RIVER, NORTH FORK.—Eastland County; rises 1 mile east of Cisco; flows northeastward and southeastward 5 miles uniting with Middle Fork Leon River 2 miles southeast of Eastland to form Leon River (tributary through Little River to the Brazos) in northern part of county. Eastland topographic map.

Leon River, South Fork.—Eastland County; rises near Scranton near Eastland-Callahan county line; flows northeasterly 22 miles into Middle Fork Leon River (tributary to Leon River, and thus through Little River to the Brazos) 1½ miles south of Eastland. Eastland topographic map.

Leona River.—Uvalde, Zavalla, and Frio counties; rises on the east side of Green Mountain (12 miles north of the town of Uvalde) at an approximate altitude of 1,600 feet above sea level; flows southerly and easterly 25 miles through Uvalde County, 29 miles through Zavalla County, thence 17 miles through Frio County into Frio River (tributary to Nueces River) near Derby. Above Uvalde this river does not carry water except during times of heavy precipitation. Uvalde topographic map.

Leoncito Creek.—McMullen County; rises in northwestern part of county; flows southeastward 13 miles into Frio River (tribuatry to the Nueces) near Tilden.

Leopard Creek.—Throckmorton County; a stream flowing easterly 7 miles to its junction with Brazos River near Elbert in northeastern part of county.

Levi Branch.—Kaufman County; small intermittent stream in northeastern part of county; flows into Buffalo Creek (tributary to East Fork of Trinity River, thence to the Trinity). Barnes Bridge topographic map.

Lewis Lake.—Bowie County; about 2 miles south of Bassett, in southwestern part of county; formed by old channel of Sulphur River (tributary to Red River and thus to the Mississippi).

Lick Branch.—Eastland County; small stream flowing southward 3½ miles into Leon River (tributary through Little River to the Brazos) southwest of Merriman. Eastland topographic map.

Lick Creek.—Franklin County; small stream flowing northerly through northeastern part of county joining Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi); length, 3 miles.

Lihe Creek.—Palo Pinto County; small stream flowing westward 4 miles into Brazos River north of Oaks Ferry in eastern part of county. Palo Pinto topographic map.

Lilly Creek.—Camp and Upshur counties; rises about 8 miles west of Pittsburgh in northwestern part of Camp County; flows southeasterly 22 miles into Little Cypress Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) about 4 miles north of Gilmer in central part of Upshur County.

Lilly Creek.—Morris and Marion counties; rises in southeastern corner of Morris County; flows southward 3 miles into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) in the northwestern part of Marion County.

Limestone Creek.—Hutchinson and Carson counties; rises in central part of Carson County; flows northerly 21 miles into Canadian River (tributary through Arkansas River to the Mississippi) 5 miles southwest of Plemons in southern part of Hutchinson County; intermittent.

Limpia Creek.—Jeff Davis and Pecos counties; rises 15 miles west of Fort Davis on southern slope of Davis Mountains, at an approximate elevation of 6,000 feet above sea level; flows eastward 10 miles to Fort Davis, thence northeastward 20 miles, then again eastward 25 miles into Paisano Creek (tributary to Pecos River and thus to Rio Grande) 8 miles north of Hovey. Valentine and Fort Davis topographic maps.

Lindleys Creek.—Walker and Montgomery counties; rises in southern part of Walker County; flows southwesterly 3 miles through Walker County, then 4 miles through Montgomery County into West San Jacinto River (tributary to San Jacinto River and thus to Galveston Bay and Gulf of Mexico.)

LINDSEY SPRING BRANCH.—Fannin County; small stream flowing into Bois d 'arc Creek (tributary to Red River and thus to the Mississippi) in southwestern part of county.

LINGUIST CREEK.—Briscoe, Floyd, and Motley counties; rises in the southeastern part of Briscoe County; flows southeasterly 10 miles into Quitaque Creek (tributary to Pease River and thus through Red River to the Mississippi) in the northwestern corner of Motley County.

LINN CREEK.—Angelina County; tributary to Neches River south of the town of Clawson in western part of county.

LINNVILLE BAYOU.—Brazoria and Matagorda counties; rises in northwest corner of Brazoria County; flows southeasterly 17 miles along the boundary between Brazoria and Matagorda counties into Caney Byou, and thence to Matagorda Bay and Gulf of Mexico; a lake is formed about 6 miles above mouth.

LINSCOME CREEK.—Caldwell County; rises north of Clark Chappell; flows through Dry Creek into Plum Creek and thus through San Marcos River to the Guadalupe. San Marcos topographic map.

LION CREEK.—Burnet County; small stream about 1 mile south of Bluffton in western part of county; flows westward 2½ miles into Colorado River. Burnet topographic map.

LIPAN CREEK.—Tom Green and Concho Counties; rises in southeastern part of Tom Green County; flows northeasterly 32 miles into Concho River (tributary to the Colorado), 7 miles west of Paint Rock in northwestern part of Concho County. Hayrick and San Angelo topographic maps.

LITTLE AGUJA CANYON.—Jeff Davis County; north branch of Big Aguja Creek; heads in Davis Mountains 10 miles northwest of Fort Davis; takes a northeasterly course about 35 miles to Toyah Creek (tributary to Pecos River and thus to Rio Grande) 2½ miles southwest of Toyahvale. Valentine and Fort Davis topographic maps.

LITTLE ALUM CREEK.—Bastrop County; in southeastern part of county; tributary through Alum Creek to Colorado River; length, 5 miles. Bastrop topographic map.

LITTLE ALUM CREEK.—Bastrop County; west of Otis in the southwestern part of the county; a branch of Alum Creek (tributary to Colorado River through Walnut Creek); length, 4 miles. Austin and Bastrop topographic maps.

LITTLE AQUILLA CREEK.—Hill County; rises 1 mile south of Cross Roads in northern part of county; flows southerly 10 miles into Aquilla Creek (tributary to Brazos River) 2 miles southwest of Peoria. Cleburne and Waco topographic maps.

LITTLE ARKANSAS CREEK.—Armstrong County; rises in western part; flows southerly 3 miles into Dry Creek (tributary to Prarie Dog Town Fork of Red River and thus through Red River to the Mississippi).

LITTLE BARTON CREEK.—Travis County; rises 4 miles east of Shingle Hills in western part of county; flows eastward 6 miles into Barton Creek (tributary to Colorado River), 3 miles southeast of Bee Caves. Blanco and Austin topographic maps.

LITTLE BEAR CREEK.—Collin County; rises 1 mile west of Pike; flows southwesterly 3 miles into Bear Creek (tributary to Pilot Grove Creek, thence through Sister Grove Creek and East Fork of the Trinity to Trinity River).

LITTLE BEAR CREEK.—Hamilton County; an intermittent stream northeast of Hamilton in western part of county; flows northeasterly 6 miles into Bear Creek (tributary to Leon River and thus through Little River to Brazos). Hamilton topographic map.

LITTLE BEAR CREEK.—Tarrant County; rises about 2 miles south of Keller; flows southeasterly 12 miles into Big Bear Creek (which discharges into Trinity River through the West Fork of Trinity), 2 miles northeast of Euless. Fort Worth topographic map.

LITTLE BLANCO RIVER.—Blanco, Comal, and Hays Counties; rises near Twin Sisters in the southern part of Blanco County; flows northeasterly 10 miles through Blanco County, 2 miles through a corner of Comal, then 4 miles through Hays County into Blanco River (tributary to San Marco River, and thus to the Guadalupe) in western part of Hays County south of Mount Sharp. Blanco topographic map.

LITTLE BLANCO RIVER.—Uvalde County; small intermittent stream in northeastern part of county; flows southerly 12 miles to its junction with Blanco River (tributary to Sabinal, Frio, and Nueces rivers), 4 miles north of Yucca Siding. Uvalde topographic map.

LITTLE BOGGEY CREEK.—Matagorda County; small stream in southern part of county; flows southerly 1 mile into Matagorda Bay and Gulf of Mexico.

LITTLE BRADY CREEK.—McCulloch County; a tributary 10 miles long joining Brady Creek (and thus through San Saba River to the Colorado) 8 miles southeast of Rochelle in the southeastern part of county. Brady topographic map.

LITTLE BRAZOS RIVER.—Limestone, Falls, Robertson, and Brazos counties; rises northwest of Kosse near the line of Limestone and Falls counties; flows southeastward 70 miles through Falls, Robertson, and Brazos counties into Brazos River near Stone City in the western part of Brazos County, southwest of Bryan; through Robertson and Brazos counties this stream flows parallel to, and from one to five miles northeast of Brazos River.

LITTLE BRUSHY CREEK.—Dewitt and Lavaca counties; rises in the eastern part of Dewitt County; flows eastward and southeastward 5 miles through Dewitt County, then 8 miles through Lavaca County into South Chicolete Creek to form Chicolete Creek, thence to Gulf of Mexico through Lavaca River and Matagorda Bay.

LITTLE BRUSHY CREEK.—Donley County; rises about 1½ miles north of Clarendon in central part of county; flows northeasterly 5 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

LITTLE CADDO CREEK.—Palo Pinto and Stephens counties; rises 4 miles southeast of Caddo in eastern part of Stephens County; flows northerly 8 miles into Big Caddo Creek (tributary to Brazos River) 4 miles west of Brad in western part of Palo Pinto County. Breckenridge topographic map.

LITTLE CAMP CREEK.—Hill and Johnson counties; a small stream flowing southerly 3 miles into Brazos River north of Kimball. Granbury topographic map.

LITTLE CANEY CREEK.—Hopkins and Wood counties; rises about 5 miles southwest of the town of Sulphur Springs in Hopkins County; flows southerly 14 miles into Lake Fork of Sabine River (tributary to the Sabine) about 5 miles northeast of Hoyt in Wood County.

LITTLE CANEY CREEK.—Hopkins County; rises about 5 miles northwest of Sulphur Springs in western part of county; flows southeasterly 15 miles into White Oak Bayou (tributary through Sulphur River to Red River and thus to the Mississippi).

LITTLE CEDAR CREEK.—Brazos County; rises in extreme northern part of county; flows northeasterly 8 miles into Navasota River (tributary to Brazos River) north of Edge.

LITTLE CEDAR BAYOU.—Harris County; rises 1 mile northwest of LaPorte; flows southeasterly 2¾ miles into Galveston Bay and thus to Gulf of Mexico; intermittent. LaPorte topographic map.

LITTLE CEDAR CREEK.—Stephens County; rises 2 miles west of LaCasa in southeastern part of county; flows northerly 15 miles into Big Cedar Creek (tributary to Brazos River) 2½ miles north of C. J. Mountain. Breckenridge topographic map.

LITTLE COW CREEK.—Newton County; rises in northwestern part of county; flows southeasterly 24 miles into Sabine River about 8 miles southeast of Burkeville.

LITTLE CREEK.—Dallas and Ellis counties; rises near Cedar Hill in Dallas County; flows southeasterly 8 miles into Red Oak Creek (tributary to Trinity River) 2 miles northwest of Red Oak in Ellis County. Dallas topographic map.

LITTLE CREEK OR NORTH PRONG OF MILL CREEK.—Red River and Bowie counties; rises about 5 miles northeast of Annona in eastern part of Red River County; flows northeasterly 13 miles into Mill Creek (tributary to Red River and thus to the Mississippi) about 8 miles northeast of Oakgrove in northwestern part of Bowie County.

LITTLE CYPRESS BAYOU OR CREEK.—Marion, Harrison, Upshur, Gregg, and Camp counties; rises about 2 miles east of Leesburg in western part of Camp County; flows eastward 63 miles to a point 4 miles east of Jefferson in southern part of county, where it enters Caddo Lake (tributary to Red River and thus to the Mississippi).

LITTLE CYPRESS CREEK.—Burnet County; tributary to Colorado River in the southeastern corner of the county; length, 8 miles. Blanco topographic map.

LITTLE CYPRESS CREEK.—Harris County; rises in northwestern part of county just west of Hockley; flows southeasterly 18 miles into Big Cypress Creek, 3 miles northeast of Big Cypress School, thence to Cypress and Spring creeks, and thus through San Jacinto River to Galveston Bay and Gulf of Mexico; intermittent. Hockley, Rose Hill, Cypress, Waller, and Ashford topographic maps.

LITTLE CYPRESS OR STEPHENS CREEK.—Cass County; rises at Bloomburg in northeastern part of county; flows northerly 8 miles into Sulphur River (tributary to Red River and thus to the Mississippi) about a mile southeast of Spencer Spur. Atlanta topographic map.

LITTLE CYPRESS CREEK.—Newton County; southern part; small tributary to Big Cypress Creek (tributary to the Sabine).

LITTLE DEER CREEK.—Falls County; rises near Lott; flows northeasterly 6 miles into Deer Creek (tributary to Brazos River) in western part of county. Temple topographic map.

LITTLE DRY BRUSHY CREEK.—Williamson County; rises in southern part of county; flows northeasterly 6 miles into Brushy Creek (tributary to San Gabriel River and thus through Little River to the Brazos) southeast of Taylor. Taylor and Bastrop topographic maps.

LITTLE DUCK CREEK.—Kent County; small stream flowing southerly 10 miles into Salt Fork of Brazos River (tributary to the Brazos).

LITTLE DUFFAU CREEK.—Erath County; rises 2 miles northeast of Selden; flows southeasterly 12 miles into Duffau Creek (tributary to Bosque River and thus to the Brazos) 3 miles southeast of Duffau near Erath-Bosque county line. Stephenville and Granbury topographic maps.

LITTLE ELKHART CREEK.—Houston County; rises in northern part of county; flows southwesterly 13 miles into Elkhart Creek (tributary to Trinity River).

LITTLE ELM CREEK.—Bell County; rises 2 miles south of Pendleton, in northern part of county; flows southeasterly 14 miles into Big Elm Creek (which discharges into Brazos River through Little River) 9 miles southeast of Temple. Temple topographic map.

LITTLE ELM CREEK.—Grayson, Collin, and Denton counties; rises about 3 miles southwest of Gunter in Grayson County; flows southwesterly 23 miles into Elm Fork of Trinity River (tributary to Trinity River) 3 miles east of Lewisville in southeastern part of Denton County.

LITTLE ELM CREEK.—Taylor County; rises in Lewis Canyon; flows northeasterly 17 miles into Elm Creek (tributary through Clear Fork of the Brazos to Brazos River) 3½ miles northwest of Abilene. Anson and Abilene topographic maps.

LITTLE FIVEMILE CREEK.—Fayette County; west of Flatonia in the southwestern part of county; an intermittent tributary to Big Fivemile Creek, and thus through Peach Creek to Guadalupe River. Flatonia topographic map.

LITTLE FLATROCK CREEK.—Burnet County; a stream 5 miles in length flowing into Flatrock Creek (tributary to Colorado) south of Marble Falls in southern part of the county. Burnet topographic map.

LITTLE FOSSIL CREEK.—Tarrant County; rises 7 miles north of Fort Worth; flows southeasterly 8 miles into Big Fossil Creek (tributary to West Fork of the Trinity, thence to Trinity River) a short distance above its mouth, about 5 miles northeast of Fort Worth. Fort Worth topographic map.

LITTLE GAP CREEK.—Collingsworth County; a stream flowing southeasterly through northwestern part of county into Salt Fork of Red River (tributary through Prairie Dog Town Fork of the Red to Red River and thus to the Mississippi); length, 6 miles.

LITTLE GRAPE CREEK.—Garza County; rises in southeastern part of county; flows northerly 6 miles into Double Mountain Fork of Brazos River (tributary to the Brazos).

LITTLE GREEN CREEK.—Erath County; rises 5 miles west of Alexander in southern part of the county; flows easterly 8 miles into Green Creek (which discharges into Brazos River through Bosque River). Stephenville topographic map.

LITTLE INDIAN CREEK.—Shackelford County; rises 5 miles southeast of Albany; flows southeasterly 3½ miles into Indian Creek (tributary through Hubbard Creek to Gonzales Creek and thus through Clear Fork of Brazos River to the Brazos). Albany topographic map.

LITTLE JIMMYS CREEK.—Brown and Comanche counties. See Martins Creek.

LITTLE KEECHIE CREEK.—Palo Pinto and Jack counties; a stream flowing southward 15 miles into Brazos River, 5 miles southwest of Graford in northern part of Palo Pinto County. Palo Pinto topographic map.

LITTLE INDIAN CREEK.—Shackelford County; rises 5 miles southeast of Albany; flows southeasterly 3½ miles into Indian Creek (tributary through Hubbard Creek to Gonzales Creek and thus through Clear Fork of Brazos River to the Brazos). Albany topographic map.

LITTLE KEECHIE CREEK.—Palo Pinto and Jack counties; a stream flowing southward 15 miles into Brazos River, 5 miles southwest of Graford in northern part of Palo Pinto County. Palo Pinto topographic map.

LITTLE LAKE CREEK.—Montgomery County; rises in the northwestern part of county; flows southeasterly 12 miles into West San Jacinto River, thence to San Jacinto River, Galveston Bay, and Gulf of Mexico.

LITTLE LAKE.—Cass County; about 5 miles west of Alamo Mills in northeastern part of county; formed by an old channel of Sulphur River (tributary to Red River, which discharges into the Mississippi). Texarkana topographic map.

LITTLE LOCO CREEK.—Nacogdoches County; flows southerly 8 miles into Bayou Loco (tributary to Angelina River and thus to the Neches) in southwestern part of county.

LITTLE LLANO RIVER.—San Saba and Llano counties; rises near Taylorville in the southeastern part of San Saba County; flows southeasterly 3½ miles through San Saba County, then 10½ miles through Llano County into Llano River (tributary to Colorado River) 2 miles south of Lone Grove in the northeastern part of Llano County. Llano topographic map.

LITTLE LUCY CREEK.—Lampasas County; rises near Cedar Top Peak; flows northeasterly 8 miles into Big Lucy Creek (tributary to Lampasas River and thus through Little River to the Brazos) 7 miles northeast of the town of Lampasas. Lampasas topographic map.

LITTLE MARY CREEK.—Parker County; rises about 4 miles north of Aledo; flows southeasterly 5 miles into Marys Creek (tributary to Clear Fork of Trinity River, thence through West Fork of the Trinity to Trinity River) near the eastern boundary of Parker County. Weatherford topographic map.

LITTLE MINERAL CREEK.—Grayson County; an intermittent stream rising at Pottsboro in western part of county and flowing northerly 9 miles into Red River (tributary to the Mississippi) about 1½ miles south of Preston. Denison topographic map.

LITTLE MOUNTAIN CREEK.—Comanche County; rises south of Fleming near Comanche-Mills county line; flows northeasterly into South Leon Creek (tributary to Leon River and thus through Little River to the Brazos) 2 miles southwest of Fleming. Brownwood and Hamilton topographic maps.

LITTLE MUELA CREEK.—Uvalde County; unites with Muela Creek (thence to Nueces River through Chapparosa, Turkey, and Elm creeks) near the corner of Kinney, Uvalde, Maverick, and Zavalla counties; length, 6 miles. Brackett topographic map.

LITTLE MUSTANG CREEK.—Red River County; rises near Wayland in southwestern part of county; flows southeastward 12 miles into Sulphur Creek (tributary to Red River and thus to the Mississippi).

LITTLE PECAN CREEK.—Clay County; an intermittent stream flowing into Red River (tributary to the Mississippi) in northeastern part of county 2½ miles northeast of Stanfield. Montague topographic map.

LITTLE PERDIDO CREEK.—Goliad County; small stream in northeastern part of county; head fork of Perdido Creek (tributary through Coleto Creek to Guadalupe River).

LITTLE PINE CREEK.—Red River County; rises about 9 miles southwest of Albion in northern part of county; flows northeasterly 9 miles into Pine Creek (tributary to Red River and thus to the Mississippi) about 2 miles west of Albion.

LITTLE PINEY BRANCH.—Bastrop County; 1 mile northwest of Upton in the central part of the county; small intermittent tributary to Colorado River; length, 5 miles. Bastrop topographic map.

Little Pin Oak Creek.—Bastrop and Fayette counties; small intermittent stream flowing through the southeastern part of Bastrop County and the northwestern part of Fayette County into Pin Oak Creek and thus to Colorado River; length, 9 miles. Bastrop and Flatonia topographic maps.

Little Piney Creek.—Bowie County; small stream about 1½ miles north of Bassett; flows into Bassett Creek (tributary to Sulphur River and thus through Red River to the Mississippi) in southwestern part of county.

Little Pine Island Bayou.—Hardin County; rises near Votaw in the northwestern corner of the county; flows southeasterly 45 miles into Pine Island Bayou (tributary to Neches River) about 12 miles northwest of Beaumont.

Little Pond Creek.—Falls County; rises near Barclay; flows southeastward 11 miles into Pond Creek (tributary to the Brazos) near Falls-Milam county line. Temple topographic map.

Little Postoak Creek.—Archer and Clay counties; formed about 11 miles northeast of Archer City near county line in eastern part of county by the junction of East and West Little Postoak creeks; flows northeasterly 2½ miles into Postoak Creek (tributary to Littel Wichita River and thus through Red River to the Mississippi) about a mile east of the Clay-Archer county line in western part of county.

Little Red River.—Briscoe and Hall counties; rises about 2 miles from eastern county line in southeastern part of Briscoe County; flows northeasterly 14 miles into Prairie Dog Town Fork of the Red (tributary to Red River, which discharges into the Mississippi) in the central part of Hall County.

Little Red Mud Creek.—Kent County; rises near Kent-Dickens county line; flows southerly 7 miles into Salt Fork of Brazos River (tributary to the Brazos) 1 mile east of the mouth of White River, in northwestern part of county.

Little River.—Bell and Milam counties; formed 7 miles southeast of Belton in central part of Bell County by union of Leon and Lampasas rivers; flows southeasterly 75 miles into Brazos River at a point 3 miles northwest of Valley Junction in eastern part of Milam County; passes near the town of Cameron in Milam County; gaging station at Cameron. Area of drainage basin, 7,560 square miles. Taylor topographic map.

Little Rocky Creek.—Bosque County; joins Brazos River north of the village of Merrivale in southeastern part of county; length, 3 miles. Waco topographic map.

Little Rocky Creek.—Washington County; rises one-half mile south of Independence in northern part of county; flows southerly 4 miles into Rocky Creek (tributary to Brazos River). Gay Hill topographic map.

Little Saline Creek.—Smith County; rises about 2 miles northeast of Hopewell; flows northeasterly 10 miles into Sabine River about 6 miles northwest of Winona.

Little Saline Creek, East Fork of.—Smith County; small stream flowing into Little Saline Creek (tributary to the Sabine) west of Winona in northern part of county.

Little Sandy Creek.—Bastrop County; rises near Elgin; flows southeastward 8 miles into Big Sandy Creek (tributary to Colorado River) about 1 mile northwest of Sayersville. Bastrop topographic map.

Little Sandy Creek.—Collingsworth County; a stream 2 miles long rising in central part of county and flowing into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

LITTLE (EAST) SANDY CREEK.—Eastland and Stephens counties; rises 2 miles southwest of Flat Top Mountain in northern part of Eastland County; flows northerly 8 miles into Sandy Creek (tributary to Hubbard Creek thence through Gonzales Creek and Clear Fork of Brazos River to the Brazos) 5 miles northwest of Gunsight. Eastland and Breckenridge topographic maps.

LITTLE SANDY CREEK.—Lamar and Red River counties; rises about 7 miles southeast of Paris in eastern part of Lamar County; flows southeasterly 21 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) one-half mile east of southwestern corner of county in northwestern part of Red River County.

LITTLE SANDY CREEK.—Wood County; flows southeasterly 9 miles into Sabine River in southeastern part of county.

LITTLE SHAWNEE CREEK.—Rusk County; rises about 3 miles northeast of Henderson; flows southwesterly 8 miles into Big Shawnee Creek and thus to Angelina and Neches rivers.

LITTLE SILVER CREEK.—Parker County; a small stream flowing into Silver Creek (tributary to West Fork of Trinity River and thus to the Trinity) in the northeastern part of the county. Weatherford topographic map.

LITTLE STINKING CREEK.—Stonewall and Kent Counties; a northeastward flowing stream joining Salt Fork of Brazos River (tributary to Brazos River); length, 8 miles.

LITTLE SUNDAY CREEK.—Palo Pinto and Erath counties; rises at Wyleyville in northern part of Erath County; flows northeasterly 13 miles into Big Sunday Creek (which discharges through Palo Pinto Creek to Brazos River) 4 miles west of Jacobs Wells in southern part of Palo Pinto County. Stephenville and Palo Pinto topographic maps.

LITTLE WALNUT CREEK.—Travis County; rises 2 miles northwest of the town of Fiskville; flows southeastward 7 miles through the central part of the county into Walnut Creek and thus to Colorado River. Austin topographic map.

LITTLE WHITEOAK CREEK.—Upshur County; rises about 3 miles southeast of Calloway; flows southeasterly 12 miles; enters Sabine River 2 miles west of Red Rock.

LITTLE WHITE ROCK CREEK.—Trinity County; rises in the northern part of the county; flows southwesterly 16 miles into White Rock Creek (tributary to Trinity River) about 3 miles northeast of Trinity.

LITTLE WICHITA RIVER.—Archer and Clay counties; formed 3 miles northeast of Archer City, in central part of Archer County, by union of the North and Middle Forks of Little Wichita River; flows northeasterly about 45 miles into Red River (tributary to the Mississippi) in northeastern part of Clay County 2½ miles west of Terral, Okla. Montague topographic map.

LITTLE WICHITA RIVER—MIDDLE FORK OR THOMAS CREEK.—Archer County; rises in southwestern part of county; flows northeastward 13 miles to a point about 3 miles northeast of Archer City, where it unites with North Fork of Little Wichita River to form Little Wichita River (tributary to Red River, which discharges into the Mississippi).

LITTLE WICHITA RIVER, SOUTH FORK.—Archer County; rises in southwestern part of county; flows northeasterly 21 miles to its junction with Middle Fork of Little Wichita River (tributary to Little Wichita and Red rivers and thus to the Mississippi) near Archer City.

LIVERPOOL CREEK.—Jackson County; a stream flowing southerly through southern part of county into Clarks Creek and thus to the Lavaca, Matagorda Bay and Gulf of Mexico; length, 3 miles.

LLANO RIVER.—Kimble, Mason, and Llano counties; formed near Junction in center of Kimble County by union of North and South Llano rivers; flows in an easterly course about 100 miles through the central part of Mason and Llano counties to its junction with Colorado River at Kingsland in the southeastern part of Llano County; drainage area, which includes areas of North and South Llano rivers, 4,460 square miles. Gaging station near Junction. Mason, Llano, and Burnet topographic maps.

The greater part of the irrigable area of this drainage is above Junction, although some lands are irrigated below that point. Water power has been developed at Junction and Mason and additional sites exist along the stream.

See Second Report of Texas Board of Water Engineers for list of certified filings of appropriations for use of water.

LLAVE CREEK.—Webb County; small intermittent stream rising in western part of the county and flowing southwesterly 5 miles into Rio Grande.

LOAFER CREEK.—Mason and McCulloch counties; a stream 9 miles long flowing through the southeastern part of McCulloch County and the northeastern part of Mason County into Tiger Creek (tributary through San Saba River to the Colorado) east of Camp San Saba. Brady and Mason topographic maps.

LOCKWOOD DRAW.—Garza County; rises in northwestern part of county; flows easterly 4 miles into North Fork of the Double Mountain Fork of Brazos River (tributary through Double Mountain Fork of the Brazos to Brazos River).

LOCO CREEK.—Nacogdoches County; small headwater stream of Bayou Loco (tributary to Angelina River and thus to the Neches) in western part of county.

LODGE CREEK.—Clay and Jack counties; rises in the southern part of Clay County; flows southeasterly 10 miles into West Fork of Trinity River (tributary to the Trinity) in the northwestern part of Jack County.

LONE TREE CREEK.—Armstrong and Donley counties; rises in southeast part of Armstrong County; flows easterly 13 miles into Mulberry Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in southwestern part of Donley County.

LONE TREE CREEK.—Wharton County; small tributary to West Bernard River (thence to San Bernard River and Gulf of Mexico) in the northern part of the county; flows easterly.

LONE GUM TREE CREEK.—Wharton County; small tributary to West Bernard River (thence to San Bernard River and Gulf of Mexico) in northern part of county; flows northeasterly.

LONE WOLF CREEK.—Mitchell County; rises in northeastern corner of county; flows southwestward about 11 miles to its junction with Colorado River at the town of Colorado in the north central part of county.

LONG BRANCH.—Archer County; rises about 8 miles northeast of Archer City in eastern part of county; flows easterly 8 miles into Little Wichita River (tributary through Red River to the Mississippi).

LONG BRANCH.—Cooke County; a small intermittent tributary about 2 miles west of Three Mounds in northern part of county; flows into North Fish Creek (which discharges into Red River through Fish Creek, and thus to the Mississippi). Gainesville topographic map.

LONG BRANCH.—Cooke County; a small stream flowing into Elm Fork of Trinity River (tributary to the Trinity) southwest of the town of Muenster in southwestern part of county; intermittent. Gainesville topographic map.

LONG BRANCH.—Eastland County; rises 2 miles north of Romney; flows southeasterly 7 miles into Sabanna River (tributary through Leon River to Little River, and thus to Brazos) 6 miles southwest of Carbon in southern part of county. Eastland topographic map.

LONG BRANCH.—Guadalupe County; south of Kingsbury; small intermittent stream flowing through the east-central part of the county into Mill Creek (tributary to the Guadalupe). San Marcos topographic map.

LONG BRANCH.—Lavaca County; small stream flowing southerly into Lavaca River (thence to Gulf of Mexico through Matagorda Bay) in the northwestern part of county; length, 5 miles. Flatonia topographic map.

LONG BRANCH.—Motley County; rises about 5 miles southwest of Matador in central part of county; flows northeasterly 11 miles into Ballard Creek (tributary through Middle Pease River to Pease River, and thus through Red River to the Mississippi) about 6 miles northeast of Matador.

LONG BRANCH.—McLennan County; a short stream in western part of county; rising 2½ miles east of Patton and flowing easterly 5 miles into Bosque River (tributary to the Brazos). Waco topographic map.

LONG BRANCH.—Wise County; small stream flowing into Callett Creek (tributary to Denton Creek, and thus through Elm Fork of the Trinity to Trinity River) in eastern part of the county.

LONGS BRANCH.—Jackson County; rises in northern part of the county; flows southeasterly 14 miles into Sandy Creek (thence to Gulf of Mexico through Navidad and Lavaca rivers and Matagorda Bay).

LONG BRANCH.—Stephens County; small intermittent tributary to Bufford Creek, thence to Brazos River in northern part of county. Breckenridge topographic map.

LONG BRANCH.—Runnels County; an intermittent stream 6 miles long northeast of Ballinger in the southern part of the county; flows into the Colorado. Ballinger topographic map.

LONG CREEK.—Hood and Parker counties; rises 1 mile south of Parsons in southern part of Parker County; flows southwesterly 11 miles into Brazos River 3 miles southwest of Center Mill in northern part of Hood County. Weatherford topographic map.

LONG CREEK.—Throckmorton County; small stream 2 miles in length flowing southeasterly into Leopard Creek (tributary to the Brazos) near mouth of Leopard Creek in northeastern part of county.

LONG CREEK.—Shackelford County; a stream flowing westerly 13 miles into Deadman Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) near Rising Sun in western part of county. Albany and Anson topographic maps.

LONG CREEK.—Wilbarger and Wichita counties; rises about one-half mile from the county line in southeastern part of Wilbarger County; flows northeasterly 8 miles into Beaver Creek (tributary to Wichita River and thus through Red River to the Mississippi) in southwestern part of Wichita County.

LONG CANYON CREEK.—Dickens County; rises in eastern part of county; flows southeasterly 10 miles into South Wichita River, thence to the Wichita and thus through Red River to the Mississippi.

L[illegible] [illegible]—[illegible] part of county, 2½ miles [illegible] of Electra [illegible] miles into Red River and thus [illegible] Burkburnett and Electra topographic maps.

Long [illegible].—[illegible] by union of several [illegible] and southeasterly [illegible] miles [illegible] Rio Grande; intermittent. Marfa [illegible] map.

Long Hollow.—[illegible] stream in the northwestern part of [illegible] Sandy Fork of Peach Creek [illegible] River [illegible] southwest of [illegible]. [illegible] map.

Long Hollow.—[illegible] stream; flows southerly 9 miles [illegible] Nueces River) 1 mile [illegible] map.

Long Hollow.—[illegible] tributary to East Nueces River [illegible] north of Uvalde [illegible] 6 miles. Uvalde topographic map.

Long John Hollow.—[illegible] northwestern part of county; [illegible] East Nueces River and thus to Nueces River. [illegible] map.

Long King Creek.—[illegible] in the central part of the county; [illegible] 2 miles south of Goodrich at the crossing of the [illegible] East & West Texas Railway Company.

Long Waterhole Branch.—San Saba County; a stream three miles long flowing through the southeastern part of the county into Marley Creek and thus to the Colorado through Fall Creek. Llano and San Saba topographic maps.

Long Tom Creek.—Trinity and Polk counties; rises in the southern part of Trinity County; flows easterly 7 miles through Trinity County, then southerly 19 miles through Polk County into Long King Creek (tributary to Trinity River) north of Livingston.

Long Draw.—Presidio County; rises in northern part of the county at an approximate altitude of 5,770 feet above sea level; takes an easterly course 20 miles to Alamita Creek (tributary to Rio Grande) 12 miles south of Marfa; intermittent. Marfa topographic map.

Long Run.—Stephens County; rises near southern Eastland County line; flows northerly 7 miles into Sandy Creek (tributary through Hubbard Creek to Gonzales Creek and Clear Fork of Brazos River, thence to the Brazos) in southwestern part of the county. Albany and Breckenridge topographic maps.

Long Slough.—Cass County; a channel of Sulphur River heading about 2 miles north of Alamo Mills and taking a southeasterly course; entering Sulphur River at State line; length, 4 miles. (Red and Mississippi rivers drainage). Texarkana topographic map.

Lopez Creek.—Irion County; small stream flowing eastward 8 miles through the southeastern part of the county to its junction with Spring Creek (tributary to Middle Concho River and thus through South Concho and Concho Rivers to the Colorado) 1½ miles northeast of Sherwood. Sherwood topographic map.

Lorino Branch.—Cooke County; small intermittent tributary to Clear Creek (which discharges into Elm Fork of Trinity River, thence to the Trinity) in the southwestern part of the county. Gainesville topographic map.

Los Achies Creek.—Oldham County; rises 10 miles northwest of Adrian; flows northwesterly 13 miles into Canadian River (tributary through Arkansas River to the Mississippi) 18 miles north of Adrian in western part of county; intermittent.

Los Moras Creek.—Kinney and Maverick counties; rises 4 miles north of Bracketville in the central part of Kinney County; flows southwesterly approximately 25 miles into Rio Grande, 5 miles north of Quemado. Brackett topographic map.

Los Morteros Creek.—Starr County; a small intermittent stream rising in western part of the county and flowing southerly 6½ miles to its junction with Rio Grande, about 1 mile northwest of Salineno.

Los Olmos Creek.—Webb and La Salle counties; rises 2 miles west of Cactus, on International & Great Northern Railway; flows northeasterly 13 miles through Webb County, then 5 miles through La Salle into Nueces River, in south central part of county.

Loss Creek.—Edwards and Kinney counties; a small intermittent tributary to Sycamore Creek (thence to Nueces River through Silver Lake and West Nueces River) in the northeastern part of Kinney County and southern part of Edwards; flows westerly 11 miles. Nueces topographic map.

Lost Creek.—Cass County; small intermittent stream flowing into Frazier Creek (tributary to Caddo Lake and thus through Red River to the Mississippi), about 7 miles north of Linden, in central part of county.

Lost Creek.—Coleman County; south of the town of Coleman in the central part of the county; flows through Home Creek into Colorado River; length, 8 miles. Coleman topographic map.

Lost Creek.—Collingsworth County, Tex., and Beckham County, Okla.; rises in northeastern part of Collingsworth County, Tex.; flows southeasterly 3 miles to its intersection with the Texas-Oklahoma boundary line, thence southerly through Beckham County, Okla., to Elm Fork of Red River (tributary through North Fork of Red River to the Red and thus to the Mississippi).

Lost Creek.—Donley County; small stream flowing through northern part of county into Saddlers Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red and Red River to the Mississippi).

Lost Creek.—Erath County; rises 1 mile southeast of Wyleyville in northern part of county; flows northerly 10 miles into Big Sunday Creek (tributary to Palo Pinto Creek and thus to Brazos River) near Palo Pinto-Erath county line. Stephenville and Palo Pinto topographic maps.

Lost Creek.—Houston County; a stream flowing southwesterly 9 miles into Caney Bayou (tributary to Trinity River) in the southwestern part of the county.

Lost or Shoal Creek.—Jack County; rises about 4 miles southwest of Jacksboro; flows northeasterly 12 miles into West Fork of Trinity River (tributary to Trinity River) 6 miles northeast of Jacksboro.

Lost Creek.—Lavaca County; small stream in southern part of county; flows southeastward 3 miles into Clarks Creek and thus to Lavaca River, Matagorda Bay, and Gulf of Mexico.

Lost Creek.—Motley County; rises about 7 miles northwest of Matador in western part of county; flows northeastward 2½ miles into Middle Pease River (tributary to Pease River and thus through Red River to the Mississippi).

L[illegible]—[illegible]; rises 3½ miles southwest of Clara in [illegible] [illegible] about 6 miles into North Fork of Buffalo [illegible] Buffalo Creek and Wichita River, and thus to Red [illegible] [illegible]. Clara and Iowa Park topographic map[illegible]

Lost C[illegible]—M[illegible] and Harris counties; rises in southeastern part [illegible] M[illegible] northeast of Moonshine Hill; flows [illegible] [illegible] J[illegible] River and thus to Gulf of Mexico; [illegible] [illegible] Moonshine Hill topographic map.

Lost C[illegible]—S[illegible] and McCulloch counties; small stream in southea[illegible] part of McCulloch and southwestern part of San Saba counties, [illegible] [illegible]; flows through Loafer Creek into Tiger Creek (tributary t[illegible] San Saba River and thus to the Colorado); length, 6 miles. Mason topogr[illegible] map.

Lost M[illegible] Creek.—Briscoe and Hall counties; rises in eastern part of [illegible] [illegible] County; flows northeasterly 5 miles into Little Red River (trib[illegible] to Prairie Dog Town Fork of Red River, which discharges into the [illegible] sissippi through Red River) in Hall County at its intersection with [illegible] west line of county.

Lost Lake.—Harris County; one mile west of Lynchburg in southeastern [illegible] of county; an arm of Buffalo Bayou; about 2 miles long. Burnett [illegible] topographic map.

Loveless Creek.—Palo Pinto County; a small stream flowing southerly 4 m[illegible] into Brazos River near Pickwick in northwestern part of county. P[illegible] Pinto topographic map.

Low Branch.—Tarrant and Johnson counties; joins Mountain Creek (tri[illegible] tary to West Fork of Trinity River, thence to the Trinity) east of M[illegible] [illegible]. Fort Worth topographic map.

Lower Keechi Creek.—Leon County; about 3 miles east of Jewett; head [illegible] Keechi Creek (tributary to Trinity River).

Lowe or Dry Creek.—Val Verde County; an intermittent stream; rises [illegible] northeastern corner of county; takes an easterly course 6½ miles [illegible] Buckleys Creek and thus to Devil's River and Rio Grande.

Lucas Creek.—Atascosa and Wilson counties; rises in northwestern part of Wilson County; flows southeastward 7 miles through Atascosa County into Borrego Creek (tributary to Nueces River through Atascosa and Frio rivers).

Lucas Creek.—Bexar County; an intermittent stream in the western part of county; flows into Medina River and thus to the San Antonio (tributary to Guadalupe River) northwest of Macdona. San Antonio topographic map.

Luce Bayou.—Liberty and Harris counties; rises in northwestern part of Liberty County; flows southwesterly 2 miles through Liberty, then 6 miles through Harris County into East San Jacinto River (tributary to San Jacinto River and Gulf of Mexico). Huffman topographic map.

Lynch Creek.—Lampasas County; rises near Twin Sister Peaks; unites with Colorado River 2 miles east of Ben in the southwestern part of county; length, 9 miles. Lampasas topographic map.

Lynn Creek.—Hunt County; small stream flowing into Wolf Creek (tributary to Cowleach Fork of Sabine, Caddo Fork of Sabine, and Sabine rivers) about 4 miles east of Greenville.

Lynn Creek.—Jack County; small stream flowing through northwestern part of county to Lake Valley Creek (which discharges into Trinity River through West Fork of the Trinity) south of Antelope.

Lynn Bayou.—Waller County; rises 4 miles north of Hemstead; flows southerly 8 miles into Brazos River 4 miles southwest of Hemstead.

TLE CREEK.—Taylor and Jones counties; rises near Potosi; flows northerly 20 miles into Elm Creek (tributary through Clear Fork of Brazos River to the Brazos) 6 miles north of Abilene in southeastern part of Jones County. Anson and Abilene topographic maps.

TTON CREEK.—Bastrop County; rises in northwestern part of county; flows southeastward 7 miles to its junction with Walnut Creek (tributary to Colorado River) 2 miles north of Miers. Austin and San Marcos topographic maps.

LACHAE CREEK.—Coke County; an intermittent stream 5 miles long southwest of Hayrick in the eastern part of the county; flows into Colorado River. Hayrick topographic map.

LADERA CANYON.—Jeff Davis County; rises on northern slope of Baldy Peak in Davis Mountains 17 miles west of Fort Davis at an approximate altitude of 7,500 feet above sea level; flows northeastward to junction with Aguja Creek to form Toyah Creek (tributary through Pecos River to Rio Grande) 2½ miles southwest of Toyahvale. Valentine and Fort Davis topographic maps.

MADERA CANYON.—Presidio County; short canyon in southern part of county; flows southerly 5 miles into Rio Grande 9 miles west of Lajitas. Terlingua topographic map.

MAGILL CREEK.—Llano County; an intermittent stream 3 miles in length flowing into Pecan Creek (tributary through Llano River to the Colorado) in the northern part of the county. Llano topographic map.

MAGNOLIA CREEK.—Sabine County; small tributary to Richland Creek (thence through Sixmile Creek to Sabine River) in southeastern part of county.

MAGOY CREEK.—Terrell County; rises in southern part; flows into Prairie Creek; intermittent. Dryden Crossing topographic map.

MAHARD CREEK.—Travis and Bastrop counties; rises near Creedmor in the southern part of Travis County; flows eastward 20 miles to its junction with Cedar Creek (tributary through Walnut Creek to Colorado River) 3 miles northeast of Glass. Austin topographic map.

MAIN CREEK.—Donley County; rises in eastern part; flows northerly 1½ miles into Salt Fork of Red River, which discharges into the Red through Prairie Dog Town Fork of the Red and thus to the Mississippi.

MAJ. LONGS CREEK.—Hartley County, Tex., and Union County, N. Mex.; rises in central part of Union County, northeastern New Mexico, enters Texas in northwestern part of Hartley County, and flows southeasterly 45 miles into Mustang Creek (tributary to Canadian River, and thus through the Arkansas to Mississippi River) 5 miles west of Channing in southern part of county; intermittent.

MALDEN LAKE (MCFARLAND LAKE).—Bowie County; about 5 miles south of Maud in southern part of county; formerly an old channel of Sulphur River (tributary to Red River and thus to the Mississippi). New Boston topographic map.

MALHIOLUM CREEK.—Bell and Coryell counties; a stream flowing southeasterly 8 miles to a point north of Moffatt, where it enters Leon River and thus through Little River to the Brazos. Gatesville and Temple topographic maps.

MALLARD CREEK.—Montague County; rises about 2 miles northwest of Dye; flows southwesterly 8 miles into Denton Creek (tributary to Elm Fork of Trinity River, and thence to Trinity River) about a mile east of Denver; intermittent. Montague topographic map.

Mammoth Creek.—Lipscomb County: rises 13 miles north of the village of Lipscomb; flows southeasterly 20 miles into Wolf Creek (tributary to North Fork of Canadian River; and thus through Canadian and Arkansas rivers to the Mississippi) 7 miles west of Shattuck, Okla.

Manahuilla Creek.—Dewitt and Goliad counties; rises near Nordheim in the southwestern part of Dewitt County: flows southeasterly 6 miles through Dewitt County, then 23 miles through Goliad County into San Antonio River (tributary to Guadalupe River) 6 miles southeast of Goliad.

Mansker Lake.—Eastland County; near Alameda, 11 miles southeast of Eastland, 6¼ miles northwest of Desdimonia, one-half mile east of Leon River (Brazos River drainage) in eastern part of county; very small. Eastland topographic map.

Maravilla Creek.—Brewster County; formed by the union of Calamity and Goat creeks, 30 miles south of Alpine: flows southeasterly 60 miles into Rio Grande, 40 miles south of Longfellow; intermittent.

Marble Bank Creek.—Kent County; a stream flowing southeasterly 8 miles into Duck Creek (tributary to Salt Fork of Brazos River and thus to the Brazos) in northern part of county.

Marcelinas Creek.—Wilson and Karnes counties; rises in central part of Wilson County; flows southeasterly 17 miles through Wilson County, then 4 miles through Karnes County into San Antonio River (tributary to Gaudalupe River) near Falls City.

Marcado Creek.—Victoria County; rises near the center of county; flows eastward 4 miles into Gariolas Creek (thence to Gulf of Mexico through Arenosa Creek, Lavaca and Matagorda bays).

Margaret Creek.—Hemphill and Roberts counties; rises near Roberts-Hemphill county line 11 miles northwest of Canadian; flows southeasterly 5 miles to its junction with Canadian River (tributary through Arkansas River to the Mississippi) 7 miles northwest of Canadian; intermittent.

Mariana Creek.—Wilson County; rises west of Floresville in the central part of the county; flows into San Antonio River, thence to the Guadalupe.

Marion Creek.—Tarrant County; rises 9 miles northwest of Fort Worth; flows southeasterly into West Fork of Trinity River (tributary to the Trinity) at Fort Worth. Fort Worth topographic map.

Maritas Creek.—Webb County; small stream in southern part of county; unites with San Juanita Creek (tributary to Rio Grande); intermittent.

Marley Creek.—San Saba County; a stream in the southeastern part of county; flows 11 miles into Fall Creek (tributary to Colorado River). Llano and Burnet topographic maps.

Marshall Creek.—Mason and Llano counties; a stream 8 miles long flowing through the southwestern part of Llano and southeastern part of Mason County into Cold Spring Creek (tributary to Hickory Creek, and thus through Llano River to the Colorado). Mason and Llano topographic maps.

Martinez Creek.—Bexar County; rises northwest of the city of San Antonio; flows southeasterly 10 miles into San Pedro Creek (tributary to San Antonio River and thus to the Guadalupe) in the southwestern part of San Antonio. San Antonio topographic map.

Martin or Deep Creek.—Mason County; rises 3 miles north of Fly Gap in northwestern part of county; flows southeasterly 15 miles into Llano River (tributary to the Colorado) 1½ miles west of Castell; partially intermittent. Mason and Llano topographic maps.

Martinez Creek.—Bexar County; rises in the eastern part of the county; flows easterly 18 miles into Rio Cibolo and thus through San Antonio River to the Guadalupe. San Antonio topographic map.

MARTINS CREEK.—Comanche and Brown counties; rises at Prairie Gap in northern part of Brown County; flows northeasterly 22 miles into Copperas Creek (tributary through Leon and Little rivers to the Brazos) 7 miles southwest of De Leon; called Little Jimmys Creek above Sidney; passes through Sidney. Brownwood and Eastland topographic maps.

MARTINS CREEK.—Jack County; a stream flowing through northeastern part of county into West Fork of Trinity River and thus to the Trinity.

MARTINS CREEK.—Maverick and Webb counties; a small intermittent stream rising in the southern part of Maverick County and flowing southerly 4 miles into Rio Grande in the western corner of Webb County.

MARTIN BRANCH.—Johnson County; rises near Brushy Knob in western part of county; flows southwesterly 4 miles into Nolands River (which discharges into the Brazos), 3 miles southeast of Munroe. Cleburne topographic map.

MARTINS CREEK.—Roberts County; an intermittent stream rising in northwestern part of county and flowing southeasterly 7 miles into Canadian River (which discharges into the Mississippi through Arkansas River) 9 miles northeast of Peaceville in northwestern part of county.

MARTINS CREEK.—Rusk and Panola counties; rises about 4 miles northeast of Henderson in Rusk County; flows northeasterly 17 miles to the county line, then southeasterly 12 miles into Sabine River in northern part of Panola County about 5 miles southwest of Tacoma.

MARYS BAYOU.—Brazoria and Galveston counties; rises in northeastern corner of Brazoria County; flows southeasterly 1 mile through Brazoria County, then 2 miles through Galveston County into Clear Creek (thence to Galveston Bay and Gulf of Mexico) near Friendswood.

MARY CREEK.—Mills and Hamilton counties; a stream flowing southeasterly 6 miles into Lampasas River (tributary through Little River to the Brazos), 1 mile north of the village of McGirk. Hamilton topographic map.

MARYS CREEK.—Parker and Tarrant counties; rises about 6 miles north of Aledo in Parker County; flows southeasterly 15 miles into Clear Fork of Trinity River (tributary to West Fork of the Trinity and thus to Trinity River), 7 miles southwest of Fort Worth. Weatherford and Fort Worth topographic maps.

MASONS CREEK.—Bandera County; small stream northeast of Bandera in the eastern part of county; flows into Bandera Creek (tributary to Medina River, and thus through San Antonio River to the Guadalupe).

MASON CREEK.—Harrison County; rises in southwestern part of county; flows southeasterly 10 miles into Sabine River.

MASON CREEK.—Harris County; rises in southeastern part of county 2 miles northeast of Katy; flows southeasterly 6½ miles to a point near Buffalo Bayou, where its channel disappears; intermittent. Katy, Addicks, and Clodine topographic maps.

MASSIE CREEK.—Bowie County; about 2 miles west of Maginnis; small stream flowing into Caney Creek (tributary to Langum Creek, and thus through Sulphur and Red Rivers to the Mississippi); intermittent.

MATATE CREEK.—Atascosa County; a small tributary of La Parita Creek (thence to Nueces River through Atascosa and Frio rivers), in the southern part of the county; flows southeasterly 11 miles. Upper stream known as East and West Matate creeks.

MATHEWS BRANCH.—Parker County; rises near Center Mill; flows westward 2 miles into Brazos River in southern part of county. Weatherford topographic map.

Mavericks Creek.—Concho County; a stream 3 miles long flowing into Brady Creek (tributary to Colorado River and through the San Saba), northeast of Eden in the southeastern part of the county. Eden topographic map.

Maverick Creek.—Edwards and Uvalde counties; a small intermittent tributary to East Nueces River (tributary to Nueces River) in the southeastern part of Edwards County and northwestern part of Uvalde County; flows southeasterly; length [illegible] miles. Nueces topographic map.

Maxon Creek.—Brewster County; rises in eastern part; flows southeasterly into San Francisco Creek (tributary to Rio Grande); intermittent. Bullis Gap and Indian Wells topographic maps.

Mayhaw Bayou.—Jefferson County; rises 3 miles southeast of Winnie in western part of county; flows northeasterly [illegible] miles into Taylors Bayou (tributary through Sabine Lake to Gulf of Mexico) about 4½ miles southeast of Hampshire.

Maynard Creek.—Sutton and Kimble counties; rises in the southeastern part of Sutton County; flows northeasterly 15 miles into North Llano River (tributary through the Llano to Colorado River) 4 miles northeast of Patterson Ranch, Kimble County. Rock Springs topographic map.

McBees Creek.—Van Zandt County; small stream flowing northeasterly 12 miles into Sabine River in northwestern part of county.

McCann Branch.—Tarrant County; a small stream flowing into Indian Creek (which discharges through West Fork of Trinity River into the Trinity) north of Dido in the northwestern part of county. Fort Worth topographic map.

McClelland Creek.—Gray County; rises in southwestern part of county; flows easterly and northeasterly 29 miles into North Fork of Red River (tributary to Red River and thus to the Mississippi) in the eastern part of the county about 1 mile from eastern boundary.

McClain Canyon.—Terrell County; rises in southwestern part, 1½ miles north of McClain ranch; flows southwesterly 4½ miles into Sanderson Canyon (tributary to Rio Grande); intermittent. Dryden Crossing topographic map.

McClung Creek.—Fannin County; rises about 6 miles southwest of Bonham in western part of county; flows easterly 6 miles into Bois d'Arc Creek (tributary to Red River and thus to the Mississippi) about 4 miles south of Bonham.

McCormick Creek.—Donley County; a stream 7 miles long flowing easterly through eastern part of county into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi).

McCormicks Lake.—Harris County; small lake 7½ miles southeast of Humble; three-tenths of a mile long and one-twentieth of a mile wide. Harmaston topographic map.

McCoy Creek.—Wise County; small stream flowing through northwestern part of county into West Fork of Trinity River (tributary to the Trinity).

McCoy Creek.—Dewitt County; in the northern part of county near Hochheim; small tributary to Queens Creek and thus to Guadalupe River.

McCullum Creek.—Armstrong and Donley counties; rises in eastern part of Armstrong County south of Goodnight; flows easterly 11 miles into Salt Ford of Red River (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in western part of Donley County near Armstrong-Donley county line.

McDonald Creek.—Crosby County; rises in southeastern part of county; flows easterly 14 miles into White River (tributary through Salt Fork of Brazos River to the Brazos) near Crosby-Dickens county line.

McDOWELL CREEK.—Stephens and Shackelford counties; rises south of Fat Top; flows southeasterly 5 miles into Hubbard Creek (tributary through Gonzales Creek to clear Fork of Brazos River and thus to the Brazos) in northwestern part of Stephens County. Albany topographic map.

McDONALDS CREEK.—Walker County; rises south of Huntsville; flows southwesterly 8 miles to its junction with West San Jacinto River (thence to San Jacinto River and Gulf of Mexico) near the southwestern county line.

McFARLAND CREEK.—Fannin County; small stream flowing southeasterly through southeastern part of county joining North Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi); length 5 miles.

McFARLAND LAKE.—Bowie County; this lake about 4 miles south of Maud in southern part of county formerly embraced the following lakes: Malden, Big. Dixon, Piney, and Spring, all of which are now connected by channels and formed by an old channel of Sulphur River (tributary to Red River, which discharges into the Mississippi). New Boston topographic map.

McGRAW CREEK.—Newton County; rises about 6 miles north of Burkeville; flows southeasterly 8 miles into Little Cow Creek (thence to Sabine River) about 2 miles southeast of Burkeville in northern part of county.

McGREW CREEK.—Hunt County; small stream flowing into Cedar Creek (tributary to Cowleach Fork of Sabine, thence to Caddo Fork of Sabine River and the Sabine) in south central part of the county.

McKENZIE CREEK.—Kent County; rises at McKenzie Mountain in southwestern part of county; flows northeasterly 10 miles into Double Mountain Fork of Brazos River (tributary to the Brazos).

McKENZIE CREEK.—Pecos County; rises about 18 miles southeast of Fort Stockton; flows easterly to its confluence with Pecos River (tributary to Rio Grande) 22 miles southeast of Fort Stockton; near old stage fort; springs supply a perennial flow which continues a distance of 3 or 4 miles then sinks in sand.

McKIM CREEK.—Sabine and Newton counties; headwater stream of Big Cow Creek (tributary to Sabine River).

McKIM CREEK.—Sabine County; flows westerly into Bear Creek (tributary to Ayish Bayou, and thus to Angelina and Neches rivers) in southwestern part of county; length, 6 miles.

McKINNEY BRANCH.—Erath County; small intermittent tributary to Bosque River 7 miles southeast of Alexander. Stephenville topographic map.

McKINNEY CREEK.—Bowie County; rises about 2 miles southwest of Leary; flows southeasterly 5 miles into Elliott Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 2 miles east of Redwater; intermittent. Texarkana topographic map.

McKINNEY LAKE.—Bowie County; about 7½ miles west of Index in northeastern part of county; formed by an old channel of Red River (tributary to the Mississippi); very small.

McLAUGHLIN CREEK.—Bastrop County; rises near McDade; flows westerly 4 miles into Big Sandy Creek and thus to Colorado River. Bastrop topographic map.

McNUTT CREEK.—Williamson County; small stream 4 miles long flowing southeasterly to a point 3 miles west of town of Hutto, where it enters Brushy Creek (tributary through San Gabriel River to Little River and thus to the Brazos). Georgetown topographic map.

MIDDLE BERNARD CREEK.—Wharton County; small stream in northern part of the county; flows easterly into Bernard River and thus to Gulf of Mexico.

MIDDLE BOSQUE RIVER.—McLennan and Coryell counties; rises near Turnersville in northern part of McLennan County; flows southeasterly 32 miles into South Bosque River (tributary to Bosque River and thus to the Brazos) in central part of McLennan County. Meridian, Temple, and Waco topographic maps.

MIDDLE BRANCH, CONCHO RIVER.—Reagan, Irion, and Tom Green Counties; rises southeast of Stiles in central part of Reagan County; flows easterly 14 miles through Reagan County, 26 miles through Irion County, then 16 miles through Tom Green County into South Concho River (tributary to the Concho and thus to Colorado River), 5 miles southwest of San Angelo in western part of Tom Green County. Sherwood topographic map. (See Concho River.)

MIDDLE FORK.—Johnson County; rises in southeastern part, 1 mile west of Stubblefield; flows southeasterly 7 miles into South Fork of Chambers Creek (tributary to Chambers Creek and thus to Trinity River). Cleburne topographic map.

MIDDLE FORK OF SULPHUR RIVER.—Fannin, Hunt, and Delta counties; rises in southern part of Fannin County; flows southeasterly 25 miles into South Sulphur River (tributary to Sulphur River, thence through Red River to the Mississippi) south of Klondike in southwestern part of Delta County.

MIDDLE FORK OF WICHITA RIVER.—King and Foard counties; rises in north central part of King County; flows northeasterly 27 miles into North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi) in the southwestern part of Foard County.

MIDDLE KICKAPOO CREEK.—Concho County; southwest of Paint Rock in the western part of the county; flows 10 miles to its junction with Kickapoo Creek and thus through Concho River to the Colorado. San Angelo and Eden topographic maps.

MIDDLE MUSTANG CREEK.—Runnels County; small stream joining Mustang Creek (tributary to the Colorado) a mile southeast of Norwood in the southeastern part of the county; length, 11 miles. Ballinger topographic map.

MIDDLE MUSTANG CREEK.—Wharton County; small intermittent stream flowing southerly to its junction with East Mustang Creek (tributary to Mustang Creek, Navidad and Lavaca rivers, and Gulf of Mexico) near the center of the southwestern county line.

MIDDLE NOLAND CREEK.—Johnson County; rises 1½ miles southwest of Bruce in western part of county; flows southeasterly 6 miles to its junction with West Noland Creek to form Nolands River (tributary to the Brazos) 2 miles southeast of Munroe. Granbury and Cleburne topographic maps.

MIDDLE PEASE RIVER.—Motley and Cottle counties; rises about 9 miles southwest of Roaring Springs in southwestern part of Motley County; flows northeastward 63 miles into Pease River (tributary to Red River and thus to the Mississippi) about 5 miles north of Swearingen in northeastern part of Cottle County.

MIDDLE VALLEY.—Sutton and Schleicher counties; a long intermittent extension of San Saba River (tributary to the Colorado) in the southeastern part of Schleicher and northern part of Sutton County; unites with North Valley at Fort McKavett, forming San Saba River proper; length, 28 miles. Fort McKavett topographic map.

Middle Walnut Creek.—Falls and Robertson counties; rises in eastern corner of Falls County; flows southward 11 miles into Walnut Creek (tributary to Little Brazos River and thus to the Brazos) 4 miles south of Bremond.

Milam Creek.—Bowie County; an intermittent stream flowing northeasterly 5 miles into Langum Creek (tributary through Sulphur River to Red River and thus to the Mississippi) about 2 miles southeast of Redwater, in southern part of county. New Boston and Texarkana topographic maps.

Mill Branch.—Bowie County; small stream flowing into Big Creek (tributary to Red River and thus to the Mississippi) about 6 miles north of Texarkana Junction in northeastern part of county.

Mill Branch.—Palo Pinto County; rises 4½ miles southwest of Palo Pinto; flows northerly 3¾ miles into Eagle Creek (tributary to Brazos River). Palo Pinto topographic map.

Mills Branch.—Harris County; small intermittent stream rising in northeastern part of county 6¼ miles northeast of Moonshine Hill; flows northeasterly 1¼ miles into Whiteoak Creek, thence to Caney Creek, and thus through East Fork of San Jacinto River to Gulf of Mexico. Moonshine Hill topographic map.

Mills Branch.—Baylor County; a stream flowing southerly 9 miles into Brazos River near Baylor-Throckmorton county line southeast of Round Timber.

Mill Creek.—Angelina County; small stream flowing into Cypress Creek, thence to Neches River in southeastern part of county.

Mill Creek.—Austin County; formed by union of East and West Forks of Mill Creek, 4 miles west of the town of Bellville; flows southeasterly 15 miles into Brazos River 3 miles northwest of San Felipe.

Mill Creek.—Burnet and Bell counties; small stream flowing northeasterly 12 miles into Lampasas River (tributary through Little River to the Brazos) 1 mile southwest of Maxdale. Georgetown topographic map.

Mill Creek.—Cass County; rises about 3 miles northwest of Linden in central part of county; flows northeastward 4 miles into Frazier Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) about 6 miles north of Linden.

Mill Creek.—Cass County; rises 4 miles west of Lanark in northeastern part of county; flows northwesterly 3 miles into Sulphur River (tributary through Red River to the Mississippi). Atlanta topographic map.

Mill Creek.—Cass County; rises about 1 mile west of Almira in western part of county; flows southwesterly 7 miles into Flat Creek (tributary through Black Cypress Bayou to Big Cypress Bayou and thus through Caddo Lake and Red River to the Mississippi) about 5 miles west of Linden.

Mill Creek.—Cass County; rises about 2 miles north of Marietta in northwestern part of county; flows northerly 5½ miles into Sulphur River (which discharges into the Mississippi through Red River) about 3 miles northeast of Jennings Lake Switch. Daingerfield topographic map.

Mill Branch.—Comanche County; small intermittent stream rising in the northeastern part of the county and flowing into Leon River (tributary to Little River and thus to the Brazos) southwest of Mount Airy. Stephenville topographic map.

Mill Creek.—Grayson County; small intermittent stream flowing into Red River (tributary to the Mississippi) near Locust in northern part of county. Denison topographic map.

Mill Creek.—Guadalupe County; rises in the Mill Creek Hills in the north central part of the county; flows southeasterly 11 miles into Guadalupe River about 13 miles southeast of Seguin. San Marcos topographic map.

Mill Creek.—Hill and Ellis counties; rises 2 miles southeast of Files Valley in northeastern part of Hill County; flows southeasterly and northeasterly 26 miles into Pecan Creek (tributary through Richland Creek to Trinity River) in southern part of Ellis County. Cleburne topographic map.

Mill Creek.—Grimes and Montgomery counties; rises in southeastern part of Grimes County; flows southeasterly 4 miles through Grimes County, then 13 miles through Montgomery County into Spring Creek (tributary to San Jacinto River, and thus to Galveston Bay and Gulf of Mexico).

Mill Creek.—Grayson County; rises 2 miles north of Pilot Grove; flows northerly 11 miles into Choctaw Creek (tributary to Red River and thus to the Mississippi) about 6 miles southeast of Denison.

Mill Creek.—Jasper County; small tributary to Neches River near Evadale.

Mill Creek.—Mason County; a stream 8 miles long flowing through central part of the county into Llano River (tributary to the Colorado). Mason topographic map.

Mill Creek.—Nacogdoches County; rises about 2 miles west of Bonito Junction; flows southeasterly 4 miles into Bayou Bonito (tributary to Bayou La Nana, thence to Angelina and Neches rivers) about one-half mile north of Nacogdoches.

Mill Creek.—Panola County; rises in southeastern part; flows southwesterly 7 miles; empties into Socagee Bayou (thence to Sabine River).

Mill Creek.—Shelby County; stream flowing into Patroon Bayou (tributary to Sabine River) southwest of Patroon in southeastern part of county.

Mill Creek.—Parker County; small tributary to Silver Creek (which discharges into Trinity River through the West Fork of the Trinity) southwest of Azle in the northeastern part of the county. Weatherford topographic map.

Mill Creek.—Shackelford County; rises 3 miles southeast of Antelope Hills in northern part of county; flows northeasterly 12 miles into Clear Fork of Brazos River (tributary to the Brazos) one mile east of Fort Griffin. Albany topographic map.

Mill Creek.—Taylor and Runnels counties; a stream flowing through the southeastern part of Runnels County, then southwest of Guion in the southern part of Taylor County into Bluff Creek and thus through Elm Creek into Colorado River; length, 10 miles. Abilene topographic map.

Mill Creek.—Titus County; in northern part; flows northwesterly 7 miles into Green Creek (tributary to Whiteoak Bayou, thence through Sulphur River to Red River and thus to the Mississippi).

Mill Creek.—Tyler County; rises about 4 miles southwest of Woodville; flows southeasterly 6 miles into Big Cypress Creek (tributary through Alabama Creek to Neches River).

Mill Creek, West Fork of.—Washington and Austin counties; rises 4 miles southwest of Burton in Washington County; flows southeasterly 25 miles to its junction with East Fork of Mill Creek forming Mill Creek (tributary to the Brazos), 4 miles west of Bellville.

Mill Creek, East Prong.—Bowie County; rises about 3 miles north of Oakgrove in southwestern part of county; flows northerly 4 miles into Mill Creek (tributary to Red River, which discharges into the Mississippi). At its mouth the stream expands into what is known as Phillips Marsh.

MILL CREEK.—Red River and Bowie counties; rises about a mile north of Avery in eastern part of Red River County; flows northeasterly and easterly 14 miles; unites with Red River (tributary to the Mississippi) about 10 miles north of De Kalb in northwestern part of Bowie County.

MILL CREEK, EAST FORK.—Washington and Austin counties; rises in the southwestern part of Washington County; flows southeasterly 26 miles to its junction with West Fork of Mill Creek, forming Mill Creek (tributary to the Brazos) 4 miles west of Bellville.

MILLS CREEK.—Burleson County; rises near Milam-Burleson county line; flows southerly 5 miles into First Yegua Creek (tributary through Yegua Creek to Brazos River).

MILL CREEK LAKE.—Bowie County; about 6 miles northwest of Oakgrove; an expansion of Mill Creek, which discharges into Red River (tributary to the Mississippi).

MILLER CREEK.—Edwards County; a small intermittent tributary to East Nueces River (thence to Nueces River) in the southern part of the county; length, 4 miles. Nueces topographic map.

MILLER CREEK.—Llano County; rises in northern part of county 5 miles northeast of Lone Grove; flows southerly 9½ miles into Llano River, and thus to the Colorado. Llano topographic map.

MILLER CREEK.—Uvalde County; small intermittent tributary to East Nueces River in western part of county. Bracket topographic map.

MILLERS OR PLUM CREEK.—Baylor, Throckmorton, and Haskell counties; rises 4 miles north of Haskell in center of Haskell County; flows northeasterly 35 miles into Brazos River, in southern part of Baylor County.

MILLERS CREEK.—Blanco County; rises about midway between Johnson City and Blanco, at an approximate altitude of 1,750 feet above mean sea level, in southern part of county; flows eastward and northward 18 miles to its junction with Pedernales River (tributary to Colorado River) 8 miles east of Johnson City. Blanco topographic map.

MILLERS CREEK.—Goliad County; small stream in southern part of county; flows southerly to its junction with Blanco Creek (thence to Gulf of Mexico through El Sarco River, Rio de la Mission, and Copano Bay).

MINE CREEK.—Leon County; a stream 4 miles long flowing westerly into Navasota River (tributary to Brazos River) near Billington.

MINERAL CREEK.—Robertson County; rises at Englewood in central part of county; flows northeasterly 9 miles into Duck Creek (tributary to Navasota River and thus to the Brazos) 2 miles northwest of Lake.

MINERAL CREEK.—Grayson County; formed about 2 miles north of Whitesboro in western part of county by union of North and South Branches of Mineral Creek; flows easterly and northerly 18 miles into Red River (tributary to the Mississippi) about 3 miles northeast of Cedar Mills in northern part of county. Denison topographic map.

MINERAL CREEK, SOUTH BRANCH OF.—Cooke and Grayson counties; rises 3 miles southwest of county line in eastern part of Cooke County; flows easterly 4 miles to its junction with the North Branch of Mineral Creek to form Mineral Creek (tributary to Red River and thus to the Mississippi) about 2 miles north of Whitesboro in western part of Grayson County. Denison topographic map.

MINERAL CREEK, NORTH BRANCH OF.—Cooke and Grayson counties; rises about 3 miles southwest of county line in eastern part of Cooke County; flows easterly 5 miles to its union with South Branch of Mineral Creek to form Mineral Creek (tributary to Red River and thus to the Mississippi) 2 miles north of Whitesboro in western part of Grayson County. Denison topographic map.

MINGUS LAKE.—Palo Pinto County; 2½ miles east of Strawn in southwestern part of county; on Palo Pinto Creek (tributary to Brazos River); very small. Palo Pinto topographic map.

MINITA CREEK.—Bexar County; rises 1 mile south of Espada Mission; flows into San Antonio River and thus to the Guadalupe; intermittent. San Antonio topographic map.

MINNEASOSA CREEK.—Hartley and Oldham counties; rises in eastern part of Union County, N. Mex., passes through extreme corner of Hartley County, Tex., and flows southeasterly 25 miles to a point 18 miles north of Adrian in western part of Oldham County, where it enters Canadian River and thus through Arkansas River to the Mississippi; intermittent.

MINNIE CREEK.—Donley and Collingsworth counties; rises in northeastern part of Donley County; flows southeasterly 7 miles into Salt Fork of Red River (tributary through Prairie Dog Town Fork of the Red to Red River and thus to the Mississippi) in Collingsworth County about a mile east of the western boundary of the county.

MINNIES CREEK.—Howard County; small stream in northeastern part of county; flows into Willies Creek and thus to the Colorado.

MINNIE CREEK.—Wilbarger County; rises in southeastern part; flows northeasterly 14 miles into Beaver Creek (tributary to Wichita River and thus through Red River to the Mississippi).

MIRASOL CREEK.—Duval and McMullin counties; rises in northern part of Duval County; flows northwestward 5 miles through Duval, then 9 miles through McMullen County into Nueces River in northwest part of county.

MISSION LAKE.—Calhoun County; a tidal lake in western part of the county formed by Guadalupe River.

MITCHELL BRANCH.—Mills County; a small stream rising northwest of Mullen in the northwestern part of the county; flows 2 miles into Pompey Creek and thus through Blanket Creek to Pecan Bayou (tributary to Colorado River). Brownwood topographic map.

MITCHELL CREEK.—Gonzales County; small intermittent stream east of the town of Gonzales in the eastern part of the county; flows into Peach Creek and thus to the Guadalupe. Flatonia topographic map.

MITCHELL CREEK.—Hopkins and Franklin counties; rises in northwestern part of Hopkins County; flows southeasterly 9 miles into Whiteoak Bayou (tributary to Sulphur River and thus to the Mississippi through Red River) in northwestern part of Franklin County.

MITCHELL CREEK.—Llano County; rises near Babyhead in northeastern part of county; flows southward 11 miles into Llano River (tributary to Colorado River), 3 miles east of the town of Llano; upper stream known as Wright Creek. Llano topographic map.

MIXONS CREEK.—Lavaca County; rises near Kinkler; flows southeastward 12 miles into Navidad River (tributary to Lavaca and thence to Gulf of Mexico through Matagorda Bay) 1 mile west of Sublime.

MONETO CREEK.—Hartley and Oldham counties; rises near line of Hartley and Oldham Counties; flows southeasterly 10 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 8 miles west of Cheyenne in northern part of Oldham County; intermittent.

MONIA CREEK.—Hartley County; an intermittent stream rising in southern part of Union County, N. Mex., entering Hartley County, Tex., 10 miles west of Romero, and flowing southeasterly 15 miles into Maj. Longs Creek (tributary to Mustang Creek, thence through Canadian and Arkansas Rivers to the Mississippi) 5 miles east of Romero in western part of county.

MONTAGUE CREEK.—Cooke County; rises on Wolf Ridge; flows southeasterly 7 miles into Elm Fork of Trinity River (tributary to the Trinity) near Lindsey; intermittent. Gainesville topographic map.

MONTELL CREEK.—Uvalde County; a spring-fed tributary in the northwestern part of the county; flows southeasterly 9 miles to its junction with East Nueces River (thence to Nueces River) about 1 mile southwest of Montell. Nueces topographic map.

MONTGOMERY LAKE.—Dallam County; 9 miles east of New Mexico-Texas boundary line in southwestern part of county; outlet, Carrizo Creek; very small.

MOODYS CREEK.—Upshur and Gregg counties; rises in the southern part of Upshur County; flows southerly 6 miles into Sabine River in the northwestern part of Gregg County.

MOORE CREEK.—Comanche County; rises 1½ miles northeast of Mercers Gap in southern part of county; flows easterly into Mercer Creek (which discharges into Leon River, thence through Little River to the Brazos) 6 miles south of Comanche. Brownwood topographic map.

MOORE CREEK.—Wichita County; a stream 8 miles long rising in northwestern part of county and flowing into Red River, which discharges into the Mississippi.

MORGAN CREEK, SOUTH FORK.—Burnet County; rises about 4 miles southwest of Lake Victor in the northern part of the county; flows southwestward 8 miles into North Fork of Morgan Creek (tributary to Colorado River) near Baldy Mountain 3 miles east of Bluffton. Burnet topographic map.

MORGAN CREEK, NORTH FORK.—Burnet County; rises near Bunker Hill in the northern part of the county; flows southwesterly 10 miles into Colorado River 1 mile east of Bluffton. Burnet topographic map.

MORGAN CREEK.—Donley and Hall counties; rises in southern part of Donley County; flows southeasterly 11 miles into Indian Creek (tributary to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi River) about 9 miles southwest of Memphis in northern part of Hall County.

MORGAN CREEK.—Howard and Mitchell counties; rises southeast of Luther in central part of Howard County; flows easterly 30 miles into Colorado River, 5½ miles southwest of the town of Colorado.

MORMAN CREEK.—Gillespie County; small stream southwest of Cherry Spring in the northern part of county; flows northwestward 6 miles into Beaver Creek (and thus through the Llano to Colorado River). Kerrville topograhpic map.

MORRIS CREEK.—Shelby County; small stream flowing into Sip Bayou (tributary to Sabine River) about 8 miles north of Hamilton in southeastern part of county.

MORRISS CREEK.—Harrison County; rises at Marshall in central part of county; flows northerly 11 miles into Little Cypress Bayou, thence to Caddo Lake and thus through Red River to the Mississippi.

MORRISON CREEK.—Caldwell County; southeast of Martindale; an intermittent stream flowing into San Marcos River (tributary to the Guadalupe). San Marcos topographic map.

MOSES BAYOU.—Galveston County; rises in central part of county; flows easterly 2 miles into Moses Lake (arm of Galveston Bay, and thence to Gulf of Mexico).

MOSS BRANCH.—Bastrop County; north of Caldwell, in the western part of the county; small intermittent tributary through Dry Creek to Colorado River; length, 4 miles. Bastrop topographic map.

[illegible] —[illegible] flows southwesterly 2 miles into [illegible] Creek [illegible] Creek to Sulphur River and [illegible] Red River to the Mississippi in southern part of county; [illegible] Boston [illegible] map.

[illegible] —[illegible] miles northwest of At[illegible] flows [illegible] into Butler Creek (tributary to Back [illegible] Red River to the Missis[illegible] about 4 miles [illegible] in northern part of county.

[illegible] —[illegible] and [illegible] counties; rises in northern part of [illegible] County; flows [illegible] 10 miles into [illegible] Creek and thus [illegible] River.

[illegible] —[illegible] and [illegible] counties; rises in northwestern part of [illegible] County 2 miles [illegible] of [illegible]; flows [illegible] along [illegible] County line [illegible] and [illegible] topographic maps.

[illegible] —[illegible] County; rises in west central part of county; flows [illegible] 6 miles into [illegible] Creek, tributary to West San Ja[illegible] River and [illegible] River [illegible] Gulf of Mexico.

[illegible] Creek.—Anderson County; a stream 4 miles long flowing south[illegible] into [illegible] Creek (tributary to Neches River) in central part of county.

[illegible] —[illegible] County; a small northeasterly flowing stream [illegible] Leon River (tributary through Little River to the Brazos) one [illegible] of [illegible] in northern part of county; length 7 miles. [illegible] topographic map.

[illegible] —Franklin County; small stream in southern part of county flowing [illegible] Big Cypress Creek (tributary to Caddo Lake, which dis[illegible] into the Mississippi through Red River).

[illegible] Creek.—Hall and Childress counties; rises in western part of Hall County; flows [illegible] Prairie Dog Town Fork of Red River (tributary to Red River, which discharges into the Mississippi) at [illegible] with eastern boundary of Hall and Childress counties.

[illegible] Creek.—Johnson, Ellis, Tarrant, and Dallas counties; rises about 2 miles [illegible] of Alvarado in central part of Johnson County; flows northeasterly 35 miles into West Fork of Trinity River (tributary to Trinity River) about 2 miles west of Eagleford. Cleburne, Fort Worth, and [illegible] topographic maps.

[illegible] Creek.—Kent County; rises in southern part; flows easterly 9 miles into Double Mountain Fork of Brazos River (tributary to the Brazos) [illegible] of H[illegible].

[illegible] Creek.—Montague and Cooke counties; rises about 1 mile northeast of Saint Jo in eastern part of Montague County; flows northeasterly 11 miles into Red River (tributary to Mississippi River) in extreme north[illegible] part of Cooke County about 2 miles northwest of Bulcher. Montague and Gainesville topographic maps.

[illegible] Creek.—Stonewall County; rises in southwestern part of county; flows southerly 10 miles into Double Mountain Fork of Brazos River (tributary to the Brazos).

[illegible] Creek.—Wise County; small stream flowing into West Fork of Trinity River (tributary to the Trinity) in western part of county.

[illegible] Creek.—Goliad County; small stream flowing southward in the southern part of the county to its junction with Blanco Creek, thence to Gulf of Mexico through El Sarco River, Rio de la Mission, and Copano Bay.

MUD BAYOU.—Jefferson and Chambers counties; rises in the southwestern corner of Jefferson County; flows southwesterly 6 miles to its junction with Elm Bayou (thence to Gulf of Mexico through Mud Bayou, East Bay Bayou, and East Galveston Bay) in the southeastern corner of Chambers County.

MUD CREEK.—Bowie County; rises about 4 miles northwest of Oak Grove in the northwestern part of county; flows easterly 19 miles into Red River (which discharges into the Mississippi) about 7½ miles northeast of Malta.

MUD CREEK, NORTH PRONG OF.—Bowie County; rises about 5 miles north of DeKalb in northern part of county; flows easterly 7 miles into Mud Creek (tributary to Red River and thus to the Mississippi).

MUD CREEK, SOUTH PRONG.—Bowie County; rises about 1½ miles northwest of Malta in northern part of county; flows northeasterly 5½ miles into Mud Creek (tributary to Red River, which discharges into the Mississippi).

MUD CREEK.—Brown and Coleman counties; rises northeast of Santa Anna; flows through the western part of Brown and eastern part of Coleman counties into Jim Ned Creek and thus through Pecan Bayou to Colorado River; length, 10 miles. Coleman topographic map.

MUD CREEK.—Cherokee County; formed about 2 miles west of Gould in northern part of county by the union of its east and west forks; flows southeasterly 24 miles into Angelina River (tributary to Neches River) about 4 miles southeast of Reklaw.

MUD CREEK.—Kinney County; rises about 6 miles northeast of Amanda; flows southwesterly 17 miles into Sycamore Creek (tributary to Rio Grande).

MUD CREEK.—Parker County; a stream 3 miles long flowing southwestward into Brazos River, northwest of Center Mill in southern part of county. Weatherford topographic map.

MUD CREEK.—Runnels County; rises north of Norwood in the eastern part of the county; flows 11 miles through Elm Creek and thus to the Colorado. Ballinger topographic map.

MUD CREEK, EAST FORK.—Smith and Cherokee counties; rises about 10 miles northeast of Tyler in Smith County; flows southwesterly 28 miles to its union with West Fork of Mud Creek about 2 miles west of Gould in northern part of Cherokee County.

MUD CREEK, WEST FORK.—Smith and Cherokee Counties; rises 2 miles south of Tyler in Smith County; flows southeasterly 23 miles to its confluence with East Fork of Mud Creek forming Mud Creek (tributary to Angelina and Neches rivers) about 2 miles west of Gould in northern part of Cherokee County.

MUD OR MERIWEATHER CREEK.—Upshur and Marion counties; rises about 3 miles west of Coffeeville in northeastern part of Upshur County; flows eastward into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) at the northwestern boundary of Marion County; length, 9 miles.

MUDDY CREEK.—Collin and Dallas counties; rises one mile northwest of Wylie in Collin County; flows southeasterly 12 miles into Rowlett Creek (tributary to East Fork of the Trinity, thence to Trinity River) about three miles northwest of Barnes Bridge in northeastern part of Dallas County. Dallas and Rockwall topographic maps.

MUDDY CREEK.—Robertson County; rises about one mile west of the village of Franklin; flows southwesterly 12 miles into Little Brazos River (tributary to Brazos River) 4 miles north of Hearne.

[illegible] Creek.—[illegible] County; small stream flowing easterly 4 miles into [illegible] (tributary to Brazos River) [illegible] miles southeast of [illegible] in [illegible] part of county.

[illegible]—Harris County; small [illegible] 2 miles southeast of Humble; [illegible] topographic map.

[illegible] Creek.—[illegible], [illegible], and [illegible] counties; small [illegible] tributary to [illegible] Creek (thence to the Nueces through [illegible] and [illegible]) in [illegible] of [illegible], [illegible], and [illegible] counties; [illegible] miles. [illegible] map.

[illegible] Creek.—[illegible] County; small tributary to Chiltipin Creek (thence to [illegible] through [illegible] Creek, [illegible] Creek, and [illegible]) in [illegible] part of county.

[illegible] Creek.—[illegible] County; [illegible] stream in northeastern [illegible] of county; flows [illegible] into Brazos River.

[illegible] Creek.—[illegible] County; rises 1 mile [illegible] of Adrian; flows northwest- [illegible] tributary through the Canadian to Arkansas River and thence to the Mississippi) [illegible] miles northwest of Adrian, in western part of county. [illegible]

[illegible] Creek.—[illegible] County; small stream in northeastern part of county; flows [illegible] miles to its junction with [illegible] Creek (tributary to the Nueces).

[illegible] Creek.—[illegible] County; flows through [illegible], in the south-eastern part of the county, into [illegible] Creek (tributary to Colorado River); length 2 miles. [illegible] topographic maps.

[illegible] Creek.—[illegible] County; small stream in northeastern part of the county; flows [illegible] to its junction with Elm Creek (tributary to the Nueces), in northeastern part of county. [illegible] topographic map.

[illegible] Lake.—Armstrong County, northwestern part; an expansion of Mulberry Creek (tributary to Prairie Dog Town Fork of Red River and thence to the Red and Mississippi Rivers); area about three-fourths square mile.

[illegible] Creek.—Armstrong, Donley, Briscoe, and Hall counties; rises in the [illegible] part of Armstrong County near western county line; flows southeasterly 62 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi), in northwestern part of Hall County.

[illegible] Creek.—Fayette County; rises 2 miles south of Flatonia; flows easterly 12 miles into West Fork Navidad River (which discharges into Lavaca River through the Navidad and thence to Matagorda Bay and Gulf of Mexico), near the Lavaca-Fayette county line. Flatonia topographic map.

Mulberry Creek.—Fayette and Lavaca counties; rises near Flatonia, in the southern part of Fayette County; flows southeasterly to its junction with Navidad River (tributary to Lavaca River and thus to Gulf of Mexico) near Oakland, in the northern part of Lavaca County. Flatonia topographic map.

Mulberry Creek.—Jones, Nolan, and Taylor counties; rises in Mulberry Canyon north of Nolan, in eastern part of Nolan County; flows northeasterly 36 miles into Clear Fork of Brazos River (tributary to the Brazos) near McCaulley, in southeastern part of Jones County. Sweetwater, Abilene, and Anson topographic maps.

Mulberry Creek.—Lamar County; rises about 2 miles west of Blossom; flows southerly 11 miles into Little Sandy Creek (tributary to Sulphur River and thus through Red River to the Mississippi).

MULBERRY CREEK.—Sterling and Tom Green counties; rises in the southeastern part of Sterling County; flows northeastward into North Concho River (tributary to the Colorado through Concho River), in the northwestern corner of Tom Green County.

MULE CREEK.—Coke and Runnels counties; rises in southeastern part of Coke County; flows northeastward 14 miles into Colorado River 4 miles south of Maverick in western part of Runnels County. Hayrick topographic map.

MULE CREEK.—Foard County; rises about 2 miles southwest of Margaret, in northeastern part of county; flows easterly 6 miles into Pease River (tributary to Red River and thus to the Mississippi) about 3 miles east of Margaret.

MULE CREEK.—Haskell County; rises 5 miles southwest of Haskell; flows southeasterly 11 miles to its junction with Paint Creek (tributary to California Creek, thence through Clear Fork of Brazos River to the Brazos), in southern part of county.

MULE CREEK.—Maverick County; an intermittent stream rising in the southern part of the county and taking a southwestern course 6 miles to its junction with Willow Creek (tributary to Rio Grande).

MULLEN CREEK.—Mills County; rises near the central part of county; flows into Brown Creek and thus through Pecan Bayou to the Colorado; length, 15 miles. Brownwood and San Saba topographic maps.

MURCHISON CREEK.—Van Zandt and Henderson counties; rises in southeastern part of Van Zandt County; flows southerly 10 miles into Kickapoo Creek (tributary to Neches River), in the northeastern part of Henderson County.

MURPHYS CREEK.—Shackleford County; a small stream flowing 5 miles northeasterly into Foyle Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) one mile above mouth of Foyle Creek. Albany topographic map.

MURVALLS BAYOU.—Rusk and Panola counties; rises about 3 miles southwest of Long Branch in Rusk County; flows northeasterly 27 miles into Sabine River about 4 miles southwest of Deadwood.

MUSCLE CREEK.—Clay and Jack counties; rises in the southern part of Clay County; flows southerly 10 miles into West Fork of Trinity River (which discharges into the Trinity) about 9 miles north of Jacksboro in Jack County.

MUSQUIZ CANYON.—Presidio, Jeff Davis, and Brewster counties; rises about 12 miles northeast of Marfa in northeastern corner of Presidio County on northern slope of the Puertacitas Mountains at an approximate altitude of 5,200 feet above sea level; flows northeasterly 6 miles into Jeff Davis County, where it continues its course 6 miles, thence southward 4 miles, then eastward 7 miles into Brewster County uniting with Paisano Creek (tributary through Pecos River to Rio Grande) 15 miles northeast of Alpine. Alpine and Fort Davis topographic maps.

MUSTANG BAYOU.—Brazoria County; rises 2 miles east of Manvale in northeastern part of county; flows southeasterly 21 miles into West Galveston Bay, and thus to Gulf of Mexico.

MUSTANG BRANCH.—Hays County; an intermittent stream in the northeastern part of the county; flows northeastward 8 miles to its junction with Onion Creek (tributary to Colorado River) 2 miles southwest of Buda. Austin topographic map.

MUSTANG CREEK.—Bosque County; rises in southwestern part of county 11 miles southwest of Meridian; flows southeasterly 7 miles into Meridian Creek (tributary to Bosque River); intermittent. Meridian topographic map.

[illegible] rises in the southwestern [illegible] Lipan and East [illegible] Bosque River and thence to the Brazos [illegible] part of Bosque County. Granbury topographic [illegible].

[illegible] rises 2 miles west of [illegible] flows southwestward [illegible] Ballinger in the northeastern [illegible].

[illegible] rises in southwestern part of county; [illegible] River [illegible] through Little River [illegible] Hamilton topographic [illegible].

[illegible] rises 7 miles north of Eden in Brady [illegible] at approximate altitude of 2,300 [illegible] miles into Concho River [illegible] county. Eden topographic map.

[illegible] counties; rises at [illegible] flows southeasterly and [illegible] miles through Wharton [illegible] county into Navidad River [illegible] and Gulf of Mexico [illegible] Wharton county line the [illegible].

[illegible] rises 3 miles south of [illegible] flows southeasterly 25 miles into [illegible] Little River [illegible] the Brazos 5 miles northwest [illegible] topographic maps.

[illegible] rises near Clayton [illegible] the State of Texas [illegible] counties [illegible] River and thus to the [illegible] northeastern part of Oldham [illegible].

[illegible] Little Elm Creek (which [illegible] the Elm Fork of the Trinity) in [illegible].

[illegible] in the southwestern [illegible] through Dewitt [illegible] enters Ecleto Creek [illegible] near Helena.

[illegible] Waxahachie Creek [illegible] Creek to Trinity [illegible].

[illegible] about a mile east of Whitesboro in [illegible] miles into Mineral Creek [illegible] about 2 miles northeast [illegible].

M[illegible] rises about 2 miles east of [illegible] 25 miles into Rock Creek [illegible] the West Fork of the [illegible] Benbrook in the [illegible] and Fort Worth [illegible].

MUSTANG CREEK.—Johnson and Hill counties; rises near Cuba in southern part of Johnson County; flows southwesterly 13 miles into Nolands River (tributary to Brazos River) 2 miles north of Blum in northwestern part of Hill County. Cleburne topographic map.

MUSTANG CREEK.—Kaufman County; joins Cedar Creek (tributary to Trinity River) south of the town of Kaufman in central part of county.

MUSTANG CREEK.—Lavaca County; formed 2 miles north of Sweet Home by the union of the North and South forks of Mustang Creek; flows easterly 7 miles into Rocky Creek (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico) 6 miles south of Hallettsville.

MUSTANG CREEK, NORTH FORK.—Lavaca County; rises in southwestern part of county; flows easterly 3 miles to confluence with South Fork Mustang Creek forming Mustang Creek (which discharges into Lavaca River, then through Rocky Creek into Matagorda Bay, and thus to Gulf of Mexico) 2 miles north of Sweet Home.

MUSTANG CREEK, SOUTH FORK.—Lavaca County; rises 5 miles northwest of Yoakum; flows easterly 7 miles to its junction with the North Fork Mustang Creek to form Mustang Creek (which discharges into Lavaca River, Matagorda Bay, and Gulf of Mexico through Rocky Creek) 2 miles north of Sweet Home.

MUSTANG CREEK.—Leon County; about 3 miles west of Keechi; small tributary to Buffalo Creek, thence through Upper Keechi Creek to Trinity River.

MUSTANG CREEK.—Uvalde and Zavalla counties; rises in the southwestern part of Uvalde County; flows southeasterly 4 miles through Uvalde County, then 10 miles through Zavalla County to its junction with Nueces River near Lapryor in the northwestern part of Zavalla County; intermittent. Uvalde topographic map.

MUSTANG CREEK.—Williamson County; rises 3 miles northeast of Hutto; flows southeasterly 15 miles south of Taylor into Brushy Creek (tributary to San Gabriel River and thus through Little River to the Brazos) 7 miles southeast of Taylor. Georgetown and Taylor topographic maps.

MUSTANG CREEK.—Wilson and Karnes counties; small stream flowing through northeastern part of Wilson and northwestern part of Karnes counties into Elm Fork of Sandies Creek (tributary to Sandies Creek and thus to Guadalupe River).

MUTE BRANCH.—Hood County; a stream 3 miles long flowing southeasterly into Robinson Creek (tributary to Brazos River) in northwestern part of county. Granbury topographic map.

MYER BRANCH.—Grayson County; a small intermittent stream flowing to Harris Creek (tributary to Mineral Creek and thus through Red River to the Mississippi) near Steedman in northwestern part of county. Denison topographic map.

NABORS CREEK.—Mills County; a small stream 7 miles long flowing 5 miles southeast of Big Valley in the southern part of the county, and emptying into the Colorado. San Saba topographic map.

NACONICHI BAYOU.—Nacogdoches County; rises in the northern part of the county; flows southeasterly 18 miles into Attoyac Bayou (tributary to Angelina and Neches rivers).

NACOSTE CREEK.—Nacogdoches County; small stream flowing southerly 8 miles into Bayou Loco (tributary to Angelina River and thus to the Neches) in western part of county.

NANCY BRANCH.—Leon County; a small stream flowing southward 1½ miles into Birch Creek (tributary of Navasota River and thus to the Brazos) west of Jewett in western part of county.

NASH CREEK.—Guadalupe County; rises near Kingsbury; flows southeasterly 11 miles into Guadalupe River 2½ miles west of Belmont near its intersection with the county line; intermittent. San Marcos topographic map.

NASH CREEK.—Eastland County; rises near Carbon in southern part of county; flows easterly 13 miles into Leon River (tributary through Little River to the Brazos) 5 miles northwest of Desdimonia. Eastland topographic map.

NAVASOTA RIVER.—Hill, Limestone, Robertson, Leon, Madison, Brazos, and Grimes counties; rises in the southwestern part of Hill County; flows southeasterly 45 miles, then southerly 80 miles along county boundaries to Old Washington on the Brazos, where it enters Brazos River 5 miles southwest of Navasota. Navasota topographic map.

NAVIDAD RIVER.—West Fork; Lavaca and Fayette counties; rises 8 miles north of Schulenburg; flows southeasterly 17 miles into Navidad River (tributary to Lavaca River, and thus to Matagorda Bay and Gulf of Mexico) in northeastern corner of Lavaca County.

NAVIDAD RIVER.—Fayette, Colorado, Lavaca, and Jackson counties; rises 2 miles northeast of Schulenburg in southeastern part of Fayette County; flows southerly and southeasterly 4 miles through Fayette County, 5 miles along the boundary between Colorado and Lavaca counties, 30 miles through Lavaca County, then 22 miles through Jackson County to its junction with Lavaca River (and thus to Gulf of Mexico through Matagorda Bay) 3½ miles north of Vanderbilt.

NEBBLETTS CREEK.—San Jacinto County; small stream in southwestern part of the county; flows southeasterly to its junction with Winter Creek (tributary to East San Jacinto River, thence through San Jacinto River to Gulf of Mexico).

NECHES RIVER.—Rises about 12 miles southeast of the town of Canton in Van Zandt County in the northeastern part of the State; flows southeasterly 260 miles, enters Sabine Lake (which discharges into Gulf of Mexico through Sabine Pass) between Jefferson and Orange counties about 16 miles southeast of Beaumont. The river has a number of tributaries, the principal one being Angelina River. Gaging station at Evadale (1904–1906). The basin is heavily wooded, and contains a number of small power sites which do not materially affect the flow; rice is irrigated in lower portion of the drainage; rainfall abundant; drainage area, 10,100 square miles. See Second Report of Texas Board of Water Engineers for list of certified filings for appropriation of water.

NEDS CREEK.—Borden County; rises in eastern part of county; flows southward 6 miles into North Fork of the Colorado (tributary to Colorado River).

NEEDMORE CREEK.—Hemphill County; an intermittent stream 5 miles in length flowing north into Canadian River (tributary to Arkansas River and thus to the Mississippi) 10 miles southeast of Canadian in central part of county.

NEGRO CREEK.—Houston County; a stream 8 miles long, flowing into Trinity River south of Weldon in the extreme southern corner of the county.

NEIL CREEK.—Bosque County; formed in southern extremity of the county by union of the North and Middle forks of Neil Creek; flows easterly 16 miles into Bosque River (tributary to Brazos River) 6½ miles southeast of Clifton. Meridian topographic map.

NEIL CREEK, NORTH FORK.—Bosque and Hamilton counties; flows southeasterly 10 miles where it joins the Middle Fork of Neil Creek forming Neil Creek (tributary to Bosque River and thus to the Brazos) 4½ miles southeast of Cranfills Gap in southern part of Bosque County; intermittent. Meridian topographic map.

NEIL CREEK, SOUTH FORK OF.—Bosque and Hamilton counties; an intermittent stream flowing northeasterly 9 miles into Neil Creek (tributary to Bosque River and thus to the Brazos) 5 miles southeast of Cranfills Gap in southern part of Bosque County. Meridian topographic map.

NEIL CREEK, MIDDLE FORK.—Bosque and Hamilton counties; flows easterly 7 miles to its junction with the North Fork of Neil Creek forming Neil Creek (tributary to Bosque River and thus to the Brazos) 4½ miles southeast of Cransfills Gap in southern part of Bosque County; intermittent. Meridian topographic map.

NELSONS CREEK.—Walker County; rises northwest of Huntsville in the west central part of the county; flows northeasterly 18 miles into Trinity River south of Kittrell.

NEVICE CREEK.—Oldham County; rises in southern part of Union County, N. Mex.; flows southeasterly into western part of Oldham County, Tex., uniting with Canadian River (tributary to Arkansas River and thus to the Mississippi) 18 miles south of State Line.

NEWMAN CREEK.—King County; rises in east central part; flows northeasterly 7 miles into South Wichita River, tributary to Wichita River and thus through the Red to Mississippi River.

NEWTON CREEK.—Dallas County; small stream flowing into Fivemile Creek (tributary to Trinity River) west of Hutchins in south central part of the county. Dallas topographic map.

NEW YEARS CREEK.—Washington County; rises 5 miles southwest of Gay Hill; flows southeasterly 25 miles into Brazos River, 5 miles east of Chappel Hill in southeastern part of county.

NICHOLS CREEK.—Jasper and Newton counties; rises in south central part of Jasper County; flows southeasterly 27 miles into Sabine River about 8 miles north of Deweyville in southern part of Newton County.

NICHOLSON CREEK.—Stonewall County; small intermittent stream rising in southwestern part of county and flowing easterly into Double Mountain Fork of Brazos River (tributary to Brazos River). Roby topographic map.

NIGGER BRANCH.—Travis County; a small stream flowing into Cow Creek and thus to Colorado River in the northwestern part of the county; length, 4 miles. Burnet topographic map.

NIGGER CREEK.—Stephens County; rises at Flat Top; flows southeasterly 7 miles into Hubbard Creek (tributary through Gonzales Creek to Clear Fork of Brazos River and thus to the Brazos) in northwestern part of county. Albany topographic map.

NIGGER HOLLOW.—Bexar County; small intermittent stream southeast of Sayers, in the eastern part of county; joins Chupaderas Creek (tributary to Calaveras Creek, and thus through San Antonio River to the Guadalupe). San Antonio topographic map.

NOBLES CREEK.—Lamar County; rises about 1 mile west of Petty in southwestern part of county; flows southeasterly 9 miles into North Sulphur River (tributary to Sulphur River, and thus through Red River to the Mississippi) at the southern boundary of the county.

NOLANDS CREEK.—Bell County; formed 3 miles northwest of Belton in central part of county by union of North and South Noland Creek; flows southeastward 6 miles into Leon River (tributary to Little River, and thus to the Brazos) 2½ miles southeast of Belton. Gatesville and Temple topographic maps.

NOLANDS RIVER.—Hill and Johnson counties; formed 2 miles southeast of Munroe in western part of Johnson County by the confluence of West and Middle Noland Creeks; flows southerly 30 miles into Brazos River 2½ miles northeast of Kopperl in northwestern part of Hill County. Cleburne topographic map.

NOLTON CREEK.—Uvalde County; small intermittent stream in the northeastern part of the county; flows in a southeasterly direcion to its junction with Sabinal River (tributary to the Nueces through Frio River) in southeastern part of county. Uvalde topographic map.

NOODLE CREEK.—Jones and Taylor counties; an intermittent stream rising south of Trent near Nolan-Jones county line and flowing northeasterly 20 miles into Clear Fork of Brazos River (tributary to the Brazos) 5 miles west of Newsom in western part of Jones County. Sweetwater and Roby topographic maps.

NORIACITAS CREEK.—Webb and Jim Hog counties; small intermittent stream rising in the southeastern corner of Webb County; flows southeastward 13 miles to its junction with Arroyo del los Angeles forming Palo Blanco Creek (tributary to Gulf of Mexico through Laguna Madre).

NORTON CREEK.—Hopkins County; rises in southern part; flows southerly 5 miles into Burke Creek (tributary to Lake Fork of Sabine River, thence to the Sabine).

NORTH CREEK.—Jack County; rises about 9 miles west of Jacksboro; flows northeasterly 14 miles into West Fork of Trinity River (tributary to the Trinity) 7 miles north of Jacksboro.

NORTH CREEK.—Kerr and Kendall counties; rises in the northeastern corner of Kerr County; flows southerly 8 miles into Cypress Creek (tributary to Guadalupe River) near Comfort. Fredericksburg topographic map.

NORTH CREEK.—Leon County; stream 5 miles long flowing into Upper Keechi Creek (tributary to Trinity River) in northeastern part of the county.

NORTH BINGHAM CREEK.—Montague County; small intermittent stream flowing into Bingham Branch (tributary through Clear Creek to Elm Fork of Trinity River, thence to the Trinity) southeast of Forestburg. Montague topographic map.

NORTH COW BAYOU.—McLennan and Falls counties; rises 7 miles west of Lorena in southern part of McLennan County; flows southeasterly 15 miles to its junction with South Cow Bayou, forming Cow Bayou (tributary to Brazos River) 1 mile north of Mooresville, in western part of Falls County. Temple topographic map.

NORTH CEDAR CREEK.—Trinity County; a stream flowing easterly into Cedar Creek (tributary to Neches River) in northeastern part of county; length, 11 miles.

NORTH CORRAL CREEK.—Collingsworth County; a stream 2 miles long rising in northeastern part of county and flowing northeasterly into Elm Fork of Red River (tributary through North Fork of Red River to Red River and thus to the Mississippi).

NORTH COTTONWOOD CREEK.—Armstrong County; southeastern part; a southeastward flowing headwater stream of Cottonwood Creek (tributary to Mulberry Creek and thus through Prairie Dog Town Fork of Red River and Red River to the Mississippi); length, 4 miles.

NORTH CONCHO RIVER.—Formed by several indeterminate channels rising in the western part of Gaines and Andrews counties; flows in a southeasterly direction 35 miles through Martin County, 6 miles through Midland County, 30 miles through Glasscock County, 33 miles through Sterling County, 3 miles through Coke County, then 30 miles through Tom Green County to the city of San Angelo, near center of Tom Green County, where it unites with the South Concho to form Concho River (tributary to the Colorado); intermittent; area of drainage basin, 7,530 square miles. Gaging station at San Angelo. Sherwood and San Angelo topographic maps. (See Concho River).

NORTH ELM CREEK.—Falls and Milam counties; rises near Falls-Bell county line 11 miles east of Temple; flows southeasterly 13 miles into Elm Creek (tributary to Little River and thus to the Brazos) in northwestern part of Milam County. Temple topographic map.

NORTH ELM CREEK.—Wheeler and Collingsworth counties, Tex., and Beckham County, Okla.; rises in southeastern part of Wheeler County; flows southeasterly 5 miles across northeastern corner of Collingsworth County to its intersection with the Texas-Oklahoma boundary line, then takes a southerly course through Beckham County, Okla., and enters Elm Fork of Red River (tributary to North Fork of Red River and thus through the Red to Mississippi River).

NORTH FISH CREEK.—Cooke County; rises about 3½ miles east of Bulcher in northern part of county; flows southeasterly 10 miles to its junction with South Fish Creek to form Fish Creek (tributary to Red River and thus to the Mississippi) 6½ miles east of Marysville. Gainesville topographic map.

NORTH FORK OF CANADIAN RIVER.—Dallam and Sherman counties; enters Texas near northwestern corner between Dallam and Sherman counties; flows easterly 15 miles through northern part of Sherman County into Oklahoma at a point 10 miles west of Texhoma; unites with Canadian River (tributary to Arkansas River and thus to the Mississippi) in eastern part of Oklahoma.

NORTH FORK.—Lavaca County; small intermittent stream in northwestern corner of county; flows southerly 6 miles to its junction with Lavaca River, and thus to Matagorda Bay and Gulf of Mexico. Flatonia topographic map.

NORTH FORK.—Shackelford County; rises 8 miles northwest of Albany; flows southeasterly 12 miles into Hubbard Creek (tributary to Gonzales Creek, thence to Clear Fork of the Brazos and thus to Brazos River). Albany topographic map.

NORTH FORK.—Williamson and Bell counties; rises 4½ miles northeast of Florence; flows northeasterly 6½ miles into Salado Creek (tributary to Lampasas River and thus to Little River). Georgetown topographic map.

NORTH FORK OF RED RIVER.—Gray and Wheeler counties; rises west of Lefors in western part of Gray County; flows southeasterly 60 miles to Texas-Oklahoma boundary line about 4 miles north of Texola in southeastern part of Wheeler County, then southeasterly 120 miles through Oklahoma to its junction with Prairie Dog Town Fork of Red River to form Red River (tributary to the Mississippi) about 2 miles east of Doans, Wilbarger County, Tex.

NORTH GRAPE CREEK.—Gillespie and Blanco counties; rises 8 miles northeast of Fredericksburg in the northeastern part of Gillespie County; flows easterly 16 miles through that county, then 9 miles through Blanco County into Pedernales River (tributary to the Colorado) 4½ miles northwest of Johnson City. Fredericksburg and Blanco topographic maps.

North Llano River.—Sutton and Kimble counties; rises in the west central part of Sutton County at approximate altitude of 2,300 feet above sea level; flows in an easterly direction 25 miles through Sutton County, then 15 miles through Kimble County to its union with South Llano River, forming Llano River (tributary to the Colorado) at Junction in the central part of Kimble County; drainage area, 803 square miles. Gaging station near Junction. Fort McKavett topographic map. (See Llano River.)

North Mesquite Creek.—Dallas County; rises about 1 mile northwest of New Hope; flows southeasterly 10 miles into East Fork of Trinity River (tributary to Trinity River) 3 miles northeast of Haughts store. Dallas and Barnes Bridge topographic map.

North Noland Creek.—Bell County; rises 2 miles south of Brookhaven; flows southeasterly 10 miles to its junction with South Noland Creek forming Noland Creek (tributary to Leon, Little, and Brazos rivers) 3 miles northwest of Belton. Gatesville topographic map.

North Paluxy Creek.—Erath County; rises 3 miles southeast of Wileyville in northern part of county; flows easterly 18 miles to a point 1 mile west of Bluff Dale, where it unites with South Paluxy Creek to form Paluxy Creek (tributary to Brazos River). Stephenville topographic map.

North Palo Pinto Creek.—Palo Pinto, Stephens, and Eastland counties; rises 1½ miles south of Ranger, in northern part of Eastland County; flows northeasterly 21 miles to its junction with South Palo Pinto Creek to form Palo Pinto Creek (tributary to Brazos River) at Mingus, in southwestern part of Palo Pinto County. Eastland, Breckenridge, and Palo Pinto topographical maps.

North Prong.—Archer County; headwater stream of West Fork of Trinity River (tributary to Trinity River), south of Westfork, in southern part of the county.

North Rocky Creek.—Burnet County; rises 3 miles north of Sunnylane, in northeastern part of county; flows easterly 10 miles to its junction with South Rocky Creek to form Rocky Creek (tributary through Lampasas and Little rivers to the Brazos). Burnet and Georgetown topographic maps.

North Sulphur River.—Fannin, Lamar, Delta, and Hopkins counties; rises about 8 miles south of Bonham, in southern part of Fannin County; flows easterly 50 miles to its union with South Sulphur River to form Suphur River (tributary to Red River and thus to the Mississippi) at the corner of Lamar, Delta, and Hopkins counties, 4 miles northeast of Sulphur Bluff.

North Valley.—Schleicher County; an intermittent stream in the southeastern part of the county; connects with Middle Valley at Fort McKavett, forming San Saba River proper (tributary to the Colorado); length, 28 miles. Fort McKavett topographic map.

North Wichita River.—Motley, Dickens, King, Cottle, Foard, Knox, and Baylor counties; rises in southeastern corner of Motley County, takes an easterly course to its junction with South Wichita River to form Wichita River (tributary to Red River and thus to the Mississippi) northwest of Seymour, in northwestern part of Baylor County; length, 75 miles; head stream known locally as Buford Creek.

North Wichita River, North Fork of.—Dickens County; rises in northeastern part; small headwater stream of North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

North Wichita River, South Fork of.—Dickens County; rises in northeastern part; small headwater stream of North Wichita River (tributary to Wichita River, which discharges into Mississippi River through the Red).

North Willow Creek.—Llano County; an intermittent tributary through San Fernando Creek to Llano River and thus to the Colorado, in the northwestern part of the county; length, 5 miles. Llano topographic map.

Nueces River.—Rises 5 miles southeast of Rock Springs, in central part of Edwards County, at approximate altitude of 2,400 feet above sea level; flows southerly 40 miles through Edwards County and 40 miles through Uvalde County, then southeasterly 32 miles through Zavalla County, 35 miles through Dimmitt County and 50 miles through La Salle County; in the southeastern corner of La Salle County the stream bends toward the northeast and continues in that direction 38 miles through McMullen County, then again trends to the southeast in Live Oak County, which course it continues to its mouth, flowing 40 miles through Live County, 8 miles along the boundary of Live Oak and San Patricio counties, then 32 miles along the boundary of Nueces and San Patricio counties and enters Corpus Christi Bay (thence to the Gulf of Mexico). The stream forks into the East and West Nueces above the west central part of Uvalde County; total length, 315 miles; area of drainage basin, 16,800 square miles. Principal tributary, Frio River. Most of the other tributaries are short and unimportant.

The Nueces is not large as streams are rated in a humid country, but traversing a semiarid region, it is of the greatest economic importance, the drainage area lying almost wholly upon the Gulf Coastal Plain. After leaving the mountains of Edwards Plateau at a point near Uvalde, the flow varies on account of seepage losses. The stream is formed by springs in the Edwards Plateau north of the Balcones escarpment and a constant flow is maintained until it reaches the foot of the Edwards Plateau, where the faulting zone intercepts the flow and it enters the porous formations below the surface. The underflow reaches the surface at points down stream where the gravel has been washed from the solid rock bottom and the flow is materially increased thereby.

The annual rainfall in the drainage varies from 15 inches in the plains country to 40 inches in the mountainous portion of the catchment.

Distributed along the river from source to mouth are a number of dams which furnish water for irrigation and municipal purposes. Artesian water exists in the Coastal Plain drainage and lands are being irrigated thereby. Gaging stations at Cinonia, Three Rivers, and Calallen. Rock Springs, Nueces, Brackett, and Uvalde topographic maps. See Second Report of Texas Board of Water Engineers for list of certified filings of appropriations for use of water.

Oak Branch.—Bell County; a small intermittent stream flowing easterly 3 miles into Cowhouse Creek (tributary through Leon River to Little and Brazos rivers) near Brookhaven. Gatesville topographic map.

Oak Creek.—Coke, Nolan and Runnels counties; rises 10 miles west of Dora in the southeastern part of Nolan County; flows southeasterly 16 miles through Nolan County, 4 miles through Coke County, thence 23 miles through Runnels County to its junction with Colorado River, 3 miles south of Maverick in the western part of Runnels County. Sweetwater and Hayrick topographic maps.

Oak Creek.—Donley and Hall counties; rises in southern part of Donley County; flows southerly about 9 miles, sinks in the Sand Hills in Hall County, about 10 miles southwest of Memphis; its drainage probably extends 5 or 6 miles on to Morgan Creek (tributary through Indian Creek to Prarie Dog Town Fork of Red River and thus through Red River to the Mississippi).

[illegible] CREEK.—[illegible] stream [illegible] miles long flowing northerly into [illegible] Creek (tributary to [illegible] River) in the northeastern part of the county.

[illegible] CREEK.—[illegible] County; small intermittent stream in northern part of county; flows southwesterly [illegible] miles into [illegible] Creek, thence through [illegible] to Rio Grande, 4 miles west of [illegible] topographic map.

[illegible] CREEK.—[illegible] County; a stream flowing southwestward 4½ miles into [illegible] Creek (tributary to [illegible] Creek, and thus to Brazos River), southwest of [illegible] post office.

[illegible] CREEK.—[illegible] County; rises 2 miles north of [illegible] in the southern part of the county; flows [illegible] miles to its junction with Llano River (tributary to the [illegible]) [illegible] mile east of Llano. Llano topographic map.

OATMEAL CREEK.—Burnet County; rises [illegible] miles southeast of Burnet in eastern part of county; flows [illegible] miles into South Fork of San Gabriel River (tributary to [illegible] River, thence to Little River and the Brazos), [illegible] miles [illegible] of [illegible]. Burnet topographic map.

[illegible] CREEK.—[illegible] rises in the southwestern part of Fayette County near [illegible]; flows westerly 1 mile through Fayette County, then [illegible] miles through [illegible] County to Peach Creek (tributary to Guadalupe River). [illegible] topographic map.

[illegible] CREEK.—Angelina County; small stream in southeastern part of county [illegible] into [illegible] Creek, thence to Angelina and Neches rivers.

[illegible] LAKE [illegible].—[illegible] County; in the northeastern part of county, 5½ miles northeast of [illegible] Hill; [illegible] Branch (tributary to Gulf of Mexico through [illegible] Creek, East Fork San Jacinto River, and San Jacinto [illegible]) [illegible] mile long and about one-half mile wide. [illegible] Hill topographic map.

[illegible] CREEK.—[illegible] County; small intermittent tributary to East Nueces River (tributary to Nueces River) [illegible] miles north of Vance in the eastern part of the county; flows [illegible] 7 miles. Nueces topographic map.

OJO DE AGUA.—Karnes County; southeast of Helena in the southern part of the county; flows into San Antonio River and thus to the Guadalupe.

OKLAHOMA DRAW.—[illegible] County; rises in eastern part; flows northeasterly 5 miles into Jesse Arroyo (tributary to Salt Fork of Red River, thence to Prairie Dog Town Fork of the Red, and thus through Red River to the Mississippi).

OLD RIVER.—Burleson County; small stream in southeastern part of county joining Brazos River 2½ miles east of Clay. Gay Hill topographic map.

OLD RIVER.—Chambers County; near Anahuac; a tidal stream connected with Trinity River; former channel of Trinity River.

OLD RIVER.—Knox County; rises east of Truscott in northern part of county; flows southeasterly about 12 miles into South Wichita River (tributary to Wichita River, and thus through Red River to the Mississippi) in northeastern part of county.

OLD RIVER.—Harris County; in southeastern part of county near Lynchburg; an arm of Buffalo Bayou; about 4 miles long, and one-half mile wide in places. Burnett Bay topographic map.

OLD RIVER.—Victoria County; 12 miles south of the town of Victoria in southern part of county; former channel of Guadalupe River.

OLEYS CREEK.—Stonewall County; a small intermittent stream in southern part of county; flows northerly into Double Mountain Fork of Brazos River (tributary to the Brazos) northwest of Pastura. Roby topographic map.

OLIVE BRANCH.—Burnet County; small stream flowing northerly 4 miles into South Rocky Creek (tributary to Rocky Creek, thence through Lampasas and Little rivers to the Brazos) in the northeastern part of the county. Burnet topographic map.

OLIVERS CREEK.—Wise and Denton counties; rises about 3 miles southeast of Decatur in Wise County; flows southeasterly 18 miles into Denton Creek (tributary to the Elm Fork of Trinity River, thence to the Trinity) about 2 miles northeast of Justin in Denton County.

OLIVE FORK OF SOUTH PEASE RIVER.—Motley County; rises about 8 miles south of Lyman in the southwestern corner of county; flows easterly 11 miles to its junction with Walnut Creek to form South Pease River (tributary through Middle Pease to Pease River and thus through Red River to the Mississippi) about 4 miles southeast of Roaring Springs.

OLMOS CREEK.—Bexar County; an intermittent branch of San Antonio River north of the City of San Antonio; rises in the north central part of the county; flows southerly 12 miles to its confluence with San Antonio River (tributary to Guadalupe River) near the northern city limits of San Antonio. San Antonio topographic map.

OLMOS CREEK.—Duval, Jim Wells, Brooks, Willacy, and Kleberg counties; rises in the western part of Duval County (upper part of stream in this county known locally as Poquita Creek); flows southeastward 43 miles through Duval County, 5 miles through the southwestern part of Jim Wells County, 10 miles through northeastern part of Brooks County, then northeastward 10 miles through the northwestern part of Willacy County, thence 5 miles through the southern part of Kleberg County into Baffins Bay, an arm of the Gulf of Mexico.

OLMOS CREEK.—Karnes County; small tributary through Escondido Creek to San Antonio River and thus to the Guadalupe; flows through southern part of county.

OLMOS CREEK.—Uvalde and Zavalla counties; small intermittent stream uniting with Gato Creek (tributary to the Nueces through Chapparosa, Turkey, and Elm creeks), in the northwestern part of Zavalla County; flows southerly; length, 10 miles. Brackett topographic map.

ONION BRANCH.—Parker County; an easterly flowing stream 4 miles long joining Kickapoo Creek (tributary to Brazos River) west of Buckner in southwestern part of county. Weatherford topographic map.

ONION CREEK.—Archer County; rises about 7 miles southeast of Archer City in southern part of the county; flows northerly 11½ miles into Little Wichita River (tributary to Red River and thus to the Mississippi) about 7½ miles northeast of Archer City.

Hays-Blanco county line in the southeastern part of Blanco County; flows

ONION CREEK.—Blanco, Hays, and Travis counties; rises about 1 mile west of southeasterly 37 miles through the northern part of Hays County, then 22 miles through the southern part of Travis County into Colorado River, about 1½ miles north of Garfield. Blanco and Austin topographic maps.

ONION CREEK.—Coryell County; a stream flowing southwesterly to a point near Eagle Springs in eastern part of county, where it joins Station Creek (tributary to Leon River and thus through Little River to the Brazos); length, 4 miles. Temple topographic map.

ONION CREEK.—Ellis County; rises south of Waxahachie in central part of Ellis County; flows southeasterly in Waxahachie Creek (tributary through Pecan Creek to Richland Creek, thence to Trinity River) in southeastern part of county; length, 18 miles.

Opossum Creek.—Ellis County; [illegible] South Fork of [illegible] Creek (tributary to [illegible] and Richland creeks and thus to the Trinity River), 2 miles northeast of Auburn in western part of the county. [illegible] topographic map.

Opossum Creek.—McCulloch County; an intermittent stream emptying into Brady Creek (tributary through San Saba River to the Colorado), southwest of Rochelle in the southeastern part of the county; length, 12 miles. Brady topographic map.

Opossum Creek.—Williamson County; rises 2 miles south of Corn Hill; flows southeasterly 15 miles into Williamson Creek (tributary through San Gabriel River to Little River and thus to the Brazos), 1½ miles south of Granger. Taylor and Georgetown topographic maps.

Opossum Hollow.—Cooke County; a small intermittent stream about 2 miles south of Marysville in northern part of county; flows into South Fish Creek, thence to Fish Creek and thus through Red River to the Mississippi. Gainesville topographic map.

Opossum Hollow.—Edwards County; a small intermittent tributary in the southern part of the county; unites with West Nueces River (thence to the Nueces) about 2 miles below Black Water Hole; flows southwesterly 4 miles. Nueces topographic map.

[illegible] Creek.—Chambers County; a small stream; rises in southern part of the county in Stephenson Lake; flows northwestward 4 miles into Trinity Bay [illegible].

[illegible] Creek.—Webb County; a small intermittent stream in eastern part of the county; flows northwestward 12 miles to its junction with Prieto Creek (tributary to the Nueces).

Oso Creek.—Nueces County; rises in the northern part of the county; flows southeastward 15 miles through an inlet into Corpus Christi Bay, thence to Gulf of Mexico.

Oso Creek.—Presidio County; rises on western slope of Chinatie Mountains 12 miles northwest of Shafter; flows southeasterly 8 miles into Cibolo Creek (tributary to Rio Grande) 5 miles northwest of Shafter. Shafter topographic map.

Otter Creek.—Henderson and Anderson counties; rises about 1 mile east of Athens in Henderson County; flows southwesterly 18 miles into Catfish Bayou (tributary to Trinity River) northeast of Cayuga in northwestern part of Anderson County.

Overcup Pond.—Cass County; about 4 miles northwest of Alamo Mills in northeastern part of county; formed by an old channel of Sulphur River (tributary to Red River and thus to the Mississippi). Texarkana topographic map.

Overcup Pond.—Cass County; an expansion of Powell Creek in northern part of County, about 3 miles northwest of Douglasville. (See Powell or Lick Creek.) Linden topographic map.

Overcup Slough.—Cass County; about 4 miles northwest of Douglasville in northern part of county; outlet of Overcup Pond. (See Powell or Lick Creek.) Linden and New Boston topographic maps.

Owens Branch.—Lee County; a small intermittent stream flowing northeasterly into Second Yegua Creek (tributary through Yegua Creek to Brazos River) in the northwestern part of county. Bastrop topographic map.

Owl Creek.—Fayette County; rises in northern part of county; tributary through Rabbs Creek to Colorado River; length, 9 miles.

OXBOW CREEK.—Hall County; a stream 5 miles long flowing northeasterly through western part of county to Little Red River (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi).

OX YOKE CREEK.—King County; rises in northeastern part of county; flows southerly 7 miles into South Wichita River (tributary to Wichita River and thus through Red River to the Mississippi) about one-half mile west of its intersection with the east boundary of county.

OYSTER BAYOU.—Chambers County; a tidal stream rising in the east central part of the county; flows southeasterly 12 miles into East Galveston Bay, and thus to Gulf of Mexico.

OYSTER BAYOU.—Fort Bend County; rises 5 miles north of Richmond; flows southeasterly 27 miles into Brazos River west of Duke; marshy throughout its course.

OYSTER CREEK.—Fort Bend and Brazoria counties; rises in the eastern part of Fort Bend County, near Sugarland; flows southerly and southeasterly 12 miles through Fort Bend County, then 40 miles through Brazoria County into the Gulf of Mexico 2 miles east of Velasco.

OYSTER CREEK.—Hunt County; rises about 2 miles southwest of Wolfe City in northern part of county; near northern boundary of county; flows southerly 4 miles into South Sulphur River (tributary to Sulphur River, thence through Red River to the Mississippi).

PA CREEK.—King County; small stream flowing northwesterly 4 miles through western part of county into South Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

PAESTA CREEK, OR EAST ARKANSAS RIVER.—Bee County; rises in northern part of county; flows southeasterly about 20 miles, passes through Beeville, and joins Aransas River (and thus to Copano Bay and Gulf of Mexico) near Skidmore in southern part of county.

PAGE CREEK.—Kinney County; a small intermittent tributary to West Nueces River (tributary to the Nueces) in northeastern part of county; flows southwesterly 3 miles. Brackett topographic map.

PAINT CREEK.—Brown, Eastland, and Callahan counties; rises 3 miles west of Sabanna; flows southeasterly 17 miles into Pecan Bayou (tributary to the Colorado) at Byrds Store. Coleman topographic map.

PAINT CREEK.—Bastrop County; a small intermittent stream flowing northwesterly into Third Yegua Creek (which discharges through Yegua Creek into Brazos River) southeast of McDade. Bastrop topographic map.

PAINT CREEK.—Young County; rises near Orth in northwestern part of county; flows southerly 6 miles into Brazos River.

PAINT CREEK.—Haskell and Stonewall counties; rises in northeastern corner of Stonewall County; flows eastward 31 miles into California Creek (tributary through Clear Fork of Brazos River to the Brazos) in the southeastern part of Haskell County.

PAISANO CREEK.—Brewster, Presidio, and Pecos counties; an intermittent stream rising near Paisano near line of Presidio and Brewster counties, at an approximate altitude of 5,200 feet above sea level; flows northeasterly 80 miles into Pecos River (tributary to Rio Grande) 8 miles west of Grandfalls. Alpine topographic map.

PAJARITOS CREEK.—Wilson County; near the town of Floresville in the central part of the county; small stream flowing into San Antonio River and thus to the Guadalupe.

[illegible] Hutchinson County; rises north-[illegible] Hutchinson County; flows north-[illegible] near northwestern corner of [illegible] Beaver River (tributary to North Fork of [illegible] River [illegible] the Canadian and Arkansas to Mississippi [illegible].

[illegible] an intermittent stream rising [illegible] 24 miles into Canadian River [illegible] Arkansas River) 25 miles [illegible] county.

[illegible] small spring discharging into Bayou [illegible] River) in southern part of [illegible].

[illegible] flows southward 8 miles into Cass [illegible] of Sulphur.

[illegible] miles long flowing south-[illegible] tributary to Rio Grande) [illegible].

[illegible] Trinity River in northern [illegible].

[illegible] 2½ miles southeast [illegible] 5 miles into Rio [illegible] map.

[illegible] rises about 5 miles [illegible] flows southeasterly [illegible] in eastern part of Sabine [illegible].

[illegible] in the northern part of the county; [illegible] tributary to Frio River and [illegible].

[illegible] 3 miles north of Fredericksburg [illegible] 14 miles into Peder-[illegible] southeast of Fredericks-[illegible].

[illegible] stream in north-[illegible] with Elm [illegible] topographic map.

[illegible] Brooks, and Willacy counties; [illegible] flows eastward 2 miles [illegible] part of Duval County, [illegible] Hogg County, 30 [illegible] Brooks County, then 24 miles through Willacy County into [illegible] and Gulf of Mexico; 28 miles [illegible] San Antonio Creek it forms a lake [illegible] Laguna de Loma Blanca.

Palo Duro Creek.—Curry County, N. Mex., and Deaf Smith and Randall counties, Tex.; rises in [illegible] part of Curry County, N. Mex.; flows easterly 75 miles to a point about 4 miles northeast of Canyon in Randall County, where it enters Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi); dry channel, carrying flood waters only at rare intervals; course and origin not definite.

Palo Pinto Creek.—Palo Pinto County; formed near Mingus Lake in southwestern part of county by union of North and South Palo Pinto creeks; flows northeasterly 28 miles into Brazos River, 1½ miles southeast of Brazos in southeastern part of county. Palo Pinto topographic map.

PALO RUCIO CREEK.—Jim Wells and Kleberg counties; rises in eastern part of Jim Wells County; flows southeasterly 15 miles to its junction with San Fernando Creek (and thus to Baffins Bay and Gulf of Mexico) in the northwestern part of Kleberg County.

PALUXY CREEK.—Erath, Hood, and Somervell counties; formed 1 mile west of Bluff Dale in northern part of Erath County by union of North and South Paluxy creeks; flows easterly 27 miles into Brazos River 3 miles northeast of Glenrose in eastern part of Somervell County. Stephenville and Granbury topographic maps.

PANTHER CANYON.—Presidio County; rises about 1 mile north of Panther Spring 4 miles southwest of Ojo Mexicano; flows southerly 6 miles into Rio Grande 12 miles west of Lajitas. Terlingua topographic map.

PANTHER CREEK.—Bowie County; rises 1 mile northwest of Corley; flows southwesterly 4½ miles into Anderson Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 2 miles southeast of Carbondale. New Boston topographic map.

PANTHER CREEK.—Briscoe and Hall counties; rises in eastern part of Briscoe County; flows southeasterly 5 miles into Little Red River (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in western part of Hall County.

PANTHER CREEK.—Collingsworth County; a stream rising in eastern part of county and flowing 3 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through the Red to the Mississippi).

PANTHER CREEK.—Denton County; small stream flowing into Little Elm Creek (tributary to Elm Fork of the Trinity, thence to Trinity River) in the eastern part of county.

PANTHER CREEK.—Franklin County; rises about 4 miles southwest of Mount Vernon in central part of county; flows southeasterly 6½ miles into Big Cypress Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) in the southeastern part of the county.

PANTHER CREEK.—Karnes County; rises in southern part of county; flows into Escondido Creek and thus to San Antonio River (tributary to Guadalupe River). Very small.

PANTHER CREEK.—Leon County; small stream flowing into Alligator Creek (tributary through Buffalo and Upper Keechi creeks to Trinity River) 2 miles north of Jewett.

PANTHER CREEK.—Mason County; a stream 6 miles long flowing through the central part of the county into Llano River and thus to the Colorado. Mason topographic map.

PANTHER CREEK.—Montgomery County; small stream in southern part of the county; flows southeasterly to its junction with West San Jacinto River, thence to San Jacinto River, Galveston Bay, and Gulf of Mexico.

PANTHER CREEK.—Montague County; rises about 2½ miles southeast of Nocona in northern part of county; flows northerly 14 miles into Red River (tributary to the Mississippi) about 3 miles west of Valley School. Montague topographic map.

PANTHER CREEK.—Palo Pinto County; flows southeasterly 6 miles into Palo Pinto Creek (tributary to Brazos River) 2 miles northwest of Gordon in southwestern part of county. Palo Pinto topographic map.

117992°—19—WSP 448——12

PANTHER CREEK.—San Saba and Llano counties; a small intermittent stream in the northwestern part of Llano County; flows into Field Creek (and thus through San Fernando Creek to Llano and Colorado rivers) north of the town of Field Creek in the southern part of San Saba County; length, 4 miles. Llano topographic map.

PAPALOTE CREEK.—Bee and San Patricio counties; rises west of Tyrant in the southern part of Bee County; flows southeastward 3 miles in Bee County, southeastward again 3 miles and northeastward 2 miles in San Patricio County, then northeastward 7 miles in Bee County to its junction with Aransas River (thence to Gulf of Mexico through Copano Bay) near the corner common to Bee, Refugio, and San Patricio counties.

PARIDA CREEK.—Webb County; small tributary to Salado Creek (thence to the Nueces) in the northeastern part of the county.

PARILLA CREEK.—Duval County; rises in the western part of the county; flows southeasterly 17 miles to its junction with Poquita Creek (thence to Gulf of Mexico through Baffins Bay) 6 miles northeast of Realitos in the south central part of the county.

PARITA CREEK.—Bexar County; rises northeast of Elmendorf; flows through the southeastern part of the county into Calaveras Creek and thus to San Antonio River (tributary to the Guadalupe). San Antonio topographic map.

PARITA CREEK.—Karnes County; a small stream flowing through the southern part of the county; joins Escondido Creek (tributary to San Antonio River and thus to the Guadalupe).

PARKER CREEK.—Anderson County; a stream flowing southwesterly 9 miles into Trinity River in southwestern part of the county.

PARKER CREEK.—Donley and Hall counties; rises in southeastern part of Donley County; flows southeasterly 11 miles into Berkley Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) about 4 miles south of Memphis in northeastern part of Hall County.

PARKS CREEK.—Gray and Donley counties; rises in southeastern part of Gray County; flows southerly 9 miles into Whitefish Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red and Red rivers to Mississippi River) in northeastern part of Donley County.

PARKER CREEK.—Marion County; small stream about 9 miles west of Jefferson; flows into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi).

PARKERS CREEK.—Medina County; rises in the northwestern part of the county; flows southerly 16 miles into Seco Creek (tributary to Nueces River through Hondo Creek and Frio River).

PARKER CREEK.—Oldham County; rises 9 miles south of Cheyenne; flows northerly 8 miles to its junction with Canadian River (tributary through Arkansas River to the Mississippi) a mile southwest of Tascosa in northeastern part of county.

PARTRIDGE CREEK.—Hamilton County; an intermittent stream in western part of county, flowing northeasterly 10 miles to a point 8 miles south of the town of Hamilton, where it enters Cowhouse Creek, which discharges into Brazos River through Leon and Little rivers. Hamilton topographic map.

PASTOREX CREEK.—Austin County; a stream flowing easterly 7 miles into West Fork of Mill Creek (tributary to Mill Creek and thus to Brazos River) west of Bellville.

PATRICK CREEK.—Parker County; rises 1 mile west of Lambert in western part of county; flows southerly into Brazos River 1½ miles south of Hiner. Weatherford topographic map.

PATRICK BAYOU.—Harris County; rises 3½ miles southwest of San Jacinto Battlefield in southeastern part of county; flows northerly 2½ miles into Buffalo Bayou and thus to Gulf of Mexico; partially intermittent. Laporte topographic map.

PATROON BAYOU.—Shelby and Sabine counties; rises about 3 miles south of Neuville in Shelby County; flows southeasterly 27 miles into Sabine River in eastern part of Sabine County, 5 miles southeast of Isla.

P. D. CREEK.—Bastrop County; small intermittent stream; joins Colorado River 2 miles north of Smithville in the southeastern part of the county; length, 6 miles. Bastrop topographic map.

PAWPAW BRANCH.—Grayson County; small intermittent tributary to Red River north of Red Branch. Denison topographic map.

PEACH CREEK.—Bastrop, Fayette, and Gonzales counties; rises 4 miles northeast of Delhi in the southern part of Bastrop County; flows southerly 7 miles through Bastrop County, 8 miles through Fayette, then 27 miles through Gonzales County into Guadalupe River about 10 miles southeast of Gonzales. Flatonia topographic map.

PEACH CREEK.—Brazos County; rises near Welburn in southern part of County; flows eastely 12 miles into Navasota River (tributary to the Brazos).

PEACH CREEK.—Caldwell County; an intermittent stream east of Luling in southern part of county; flowing into Plum Creek (tributary to San Marcos River and thus to Guadalupe River). San Marcos topographic map.

PEACH CREEK, SANDY FORK.—Caldwell and Gonzales counties; rises near Delhi in the eastern part of Caldwell County; flows southerly and southeasterly 14 miles through Caldwell County, then 18 miles through Gonzales County into Peach Creek (tributary to Guadalupe River) 4 miles southeast of Possumtrot. Flatonia topographic map.

PEACH CREEK.—Grimes County; small stream flowing westerly 4 miles into Ben Fort Creek (tributary to Navasota River and thus to the Brazos) in north central part of county.

PEACH CREEK.—Robertson County; rises in southwest corner of county; flows southwestward 6 miles into Campbells Creek (tributary through Little Brazos River to the Brazos) 2 miles west of Benchley.

PEACH CREEK.—San Jacinto County; small stream in southwestern corner of the county; flows northeasterly 5 miles into Winter Creek (tributary to East San Jacinto River, San Jacinto River, and Gulf of Mexico).

PEACH CREEK.—Wharton County; rises in the north central part of the county; flows southeasterly 17 miles into San Bernard River and thus to Gulf of Mexico.

PEACH CREEK.—Walker, San Jacinto, Montgomery, and Harris counties; rises in the southeastern part of Walker County; flows southerly and southeasterly 2 miles, forming the boundary between Walker and San Jacinto counties; 17 miles along the boundary of San Jacinto and Montgomery counties, 18 miles through Montgomery County, then 1 mile through Harris County into East San Jacinto River (tributary to Galveston Bay and Gulf of Mexico).

PEASE RIVER.—Swisher, Briscoe, Floyd, Motley, Cottle, Hardeman, Foard, and Wilbarger counties; rises about 2 miles north of Whitfield, in southeastern part of Swisher County; flows eastward 156 miles into Red River (tributary to the Mississippi) 5 miles north of Oaklaunion, in northern part of Wilbarger County; called North Pease River above its confluence with Middle Pease River, in northeastern part of Cottle County.

PECAN BAYOU.—Callahan, Coleman, Brown, and Mills counties; rises 6 miles west of Baird in Callahan County at an approximate altitude of 2,000 feet above sea level; flows southeasterly 25 miles through Callahan County, 22 miles through Coleman County, [illegible] miles through Brown County, then 16 miles through Mills County into Colorado River 3 miles northwest of Big Valley in southern part of Mills County.

[illegible] the [illegible] on the stream and water is stored for municipal uses by the city of Brownwood.

See Second Report of Texas Board of Water Engineers for list of certified filings for appropriation of water. Coleman, Brownwood, and San Saba topographic maps.

PECAN BAYOU.—Red River County; rises about 5 miles north of Detroit, in northwestern part of county; flows eastward 40 miles across the county into Red River (tributary to Mississippi River) near northeastern corner of county.

PECAN BAYOU, NORTH FORK OF.—Red River County; rises about 9 miles northeast of Detroit in northern part of county; flows southeasterly 4 miles into Pecan Bayou (tributary to Red River and thus to the Mississippi).

PECAN BAYOU, SOUTH FORK OF.—Red River County; rises about 2½ miles northeast of Bogata in central part of county; flows easterly 9 miles into Pecan Bayou (tributary to Red River and thus to the Mississippi).

PECAN BRANCH.—Cooke County; small intermittent stream flowing through southwestern part of county into Clear Creek, thence to Elm Fork of Trinity River and the Trinity. Gainesville topographic map.

PECAN BRANCH.—McLennan County; rises 2 miles northeast of Oglesby; flows northeasterly 8 miles into Middle Bosque River (tributary through South Bosque to Bosque River and thus to the Brazos). Temple and Waco topographic maps.

PECAN SPRING BRANCH.—Lampasas and Burnet counties; rises north of Bunker Hill in northern part of Burnet County; flows northeasterly into Donalson Creek (tributary through Sulphur Creek to Lampasas River, then through Little River to the Brazos) 2 miles southwest of Lampasas; length, 8 miles. Lampasas and Burnet topographic maps.

PECAN SPRINGS BRANCH.—Mason County; a small intermittent stream in the southeastern part of the county; empties into Marshall Creek and thus through Cold Springs Creek to Hickory Creek (tributary through the Llano to Colorado River); length, 3 miles. Mason and Llano topographic maps.

PECAN CREEK.—Bell County; a stream flowing southeasterly 5 miles to Oenaville, where it enters Big Elm Creek (tributary to Little River and thus to the Brazos) in eastern part of the county. Temple topographic map.

PECAN CREEK.—Cooke County; rises about a mile northwest of Windsor Siding; flows southeasterly 9 miles into Elm Fork of Trinity River (tributary to the Trinity) about 3 miles south of Gainesville. Gainesville topographic map.

PECAN CREEK.—Denton County; rises in the northeastern part of county; flows southerly 15 miles into Little Elm Creek (tributary to Elm Fork of Trinity River, thence to the Trinity), in the eastern part of the county.

PECAN CREEK.—Eastland and Stephens counties; rises in northwestern part of Eastland County; flows northeasterly 13 miles into Battle Creek (tributary to Bear Creek and thus through Sandy, Hubbard, and Gonzales creeks to Clear Fork of Brazos and Brazos rivers) 2 miles south of Mankins Mill, in southwestern part of Stephens County. Albany topographic map.

PECAN OR CHAMBERS CREEK.—Ellis and Navarro counties; formed southwest of the town of Waxahachie, in southwestern part of Ellis County, by union of North and South Forks of Pecan Creek; flows southeasterly 55 miles into Richland Creek (tributary to Trinity River) north of Winkler, in southwestern part of Navarro County.

PECAN CREEK.—Fannin, Hunt, and Delta counties; rises in southeastern part of Fannin County near southern boundary; flows southeasterly 11 miles into Middle Fork of Sulphur River (tributary through South Sulphur River to Sulphur River, and thus through Red River to the Mississippi) in southwestern part of Delta County near the western county line.

PECAN CREEK.—Hamilton County; rises 3 miles south of the town of Hamilton, in central part of county; flows northeasterly to a point 7 miles northeast of Hamilton, where it enters Leon River (tributary to Little River and thus to the Brazos). Hamilton topographic map.

PECAN CREEK.—Hill County; rises 6 miles southeast of Itasca, in northern part of the county; flows southeasterly into Richland Creek (tributary to Trinity River), in eastern part of county. Cleburne topographic map.

PECAN CREEK.—Gillespie County; rises 13 miles northwest of Fredericksburg; flows southeasterly 9½ miles into Live Oak Creek (tributary to Pedernales River); partially intermittent. Kerrville and Fredericksburg topographic maps.

PECAN OR CHAMBERS CREEK, NORTH FORK.—Johnson and Ellis counties; rises in the town of Egan, central part of Johnson County; flows southeasterly 22 miles to its confluence with the South Fork of Pecan Creek, forming Pecan Creek (tributary to Richland Creek, thence to the Trinity) in the southwestern part of Ellis County. Cleburne topographic map.

PECAN OR CHAMBERS CREEK, MIDDLE FORK.—Johnson County; small stream flowing to a point east of Stubblefield, in the eastern part of county, where it joins the South Fork of Pecan Creek, thence to Pecan and Richland creeks and Trinity River. Cleburne topographic map.

PECAN CREEK.—Llano County; a stream 6 miles in length flowing into Colorado River in the southeastern part of the county. Burnet topographic map.

PECAN CREEK.—Montague County; rises at Nocona, in northern part of county; flows northerly 10 miles into Red River (which discharges into the Mississippi) about 2½ miles northeast of Red River Station Crossing. Montague topographic map.

PECAN CREEK.—San Saba and Llano counties; rises 4 miles southwest of Cherokee, in the southern part of San Saba County; flows southward 15 miles into Llano River (tributary to the Colorado) a mile west of Llano, in the central part of Llano County. Llano topographic map.

PECAN CREEK.—Sutton and Kimble counties; a small stream in the northwestern part of Kimble and western part of Sutton counties; flows through West Copperas and Copperas Creeks to North Llano River and thus to the Llano (tributary to Colorado River); length, 3 miles. Fort McKavett topographic map.

PECAN CREEK.—Tom Green County; rises in the southern part of the county; flows northwestward 21 miles into South Concho River (tributary to the Concho and thus to Colorado River) 9 miles south of San Angelo, in the central part of the county. San Angelo topographic map.

PECAN SPRING.—Coke County; small intermittent spring in upper portion of Red Bank Creek drainage, near Coke-Tom Green county line. Hayrick topographic map.

PECOS RIVER.—Rises on eastern slope of Santa Fe Mountain Range, in Mora County, N. Mex.; enters the State of Texas near State Line, Loving County; meanders in a general southeasterly course approximately 170 miles through a narrow alluvial valley to Sheffield; from this point it continues in a southeasterly course 90 miles through a deep box canyon to its junction with Rio Grande 10 miles west of Comstock, Val Verde County; principal tributaries (intermittent) Toyah and Comanche creeks which enter in the State of Texas, and Delaware Creek just north of New Mexico-Texas State line. Gaging stations at Angeles, 1914–1918; Barstow, 1914–1918; Grandfalls, 1915–1918; near Moorhead, 1900–1918; near Pecos, 1898–1907; near Marigueretta flume (1898), 1900–1907; West Valley ditch near Pecos, 1900–1906.

This stream is the principal tributary of the lower Rio Grande.

There are no water-power developments along the stream in Texas, but considerable water is diverted near Pecos and Grandfalls for irrigation. See Second Report of Texas Board of Water Engineers for list of certified filings for appropriation of water.

PEDERNALES RIVER.—Kimble, Gillespie, Blanco, Hays, and Travis counties; rises 5 miles west of Harper in the southeastern corner of Kimble County; flows southerly and easterly 4 miles through Kimble County, 48 miles through Gillespie County, 38 miles through Blanco County, 2 miles through Hays County, thence 14 miles through Travis County into Colorado River 3 miles east of the western Travis county line; drainage area, 1,300 square miles; one of the principal tributaries to Colorado River. Kerrville, Fredericksburg, and Blanco topographic maps.

PEDRIZA CREEK.—Oldham and Hartley counties; an intermittent stream rising in southern part of Hartley County, and flowing southeasterly into Canadian River (which discharges into the Mississippi through Arkansas River) 8 miles west of Cheyenne in northern part of Oldham County.

PEN BRANCH.—King County; a stream flowing easterly 13 miles into Croton Creek (tributary to Brazos River) in southern part of county.

PENA CREEK.—Dimmit and Zavalla counties; rises in northwestern part of Dimmit County; flows northely 20 miles to its junction with Elm Creek (tributary to Nueces River) in southwestern part of Zavalla County.

PENDENCIA CREEK.—Dimmit and Zavalla counties; intermittent stream; flows northward 14 miles to its junction with Comanche Creek (thence to Nueces River through Elm Creek) in southwestern part of Zavalla County.

PENN CREEK.—Nacogdoches County; small stream flowing into Beech Creek (tributary through East Shawnee Creek to Angelina River and thus to the Neches) in northern part of county.

PEPPER CREEK.—Bell County; rises near the village of Howard in northern part of county; flows southwesterly 8 miles into Leon River (tributary to Little River and thus to the Brazos) 2½ miles east of Belton. Temple topographic map.

PEPPERCAMP CREEK.—Fannin County; small tributary to Red River (which discharges into the Mississippi) in northwestern part of county.

PERDIDO CREEK.—Goliad County; rises in the northeastern part of the county; flows easterly 15 miles into Coleto Creek and thus to Guadalupe River.

PERDIZ CREEK.—Presidio County; an intermittent stream flowing southeasterly 16 miles through central part of the county to its confluence with Alamita Creek (tributary to Rio Grande) 6 miles north of Alamito. Marfa topographic map.

PERSIMMON CREEK.—Terrell County; rises in southwestern part, 2 miles southeast of McClain Ranch; flows southeasterly 7½ miles into Indian Creek, tributary to Rio Grande; intermittent. Dryden Crossing topographic map.

PETE CREEK.—Stephens County; small stream flowing northerly 3 miles into Clear Fork of Brazos River (tributary to Brazos River) 2 miles southwest of Eliasville in northern part of county. Breckenridge topographic map.

PETER CREEK.—Burnet County; a stream 6 miles long flowing through the northern part of Hoover Valley in the southwestern part of the county into Colorado River. Burnet topographic map.

PETES CREEK.—Crosby County; rises near Crosby-Dickens county line, directly east of Emma; flows southerly 7 miles into White River (tributary to Salt Fork of the Brazos and thus to Brazos River).

PETRIFIED CANYON.—Donley County; northeastern part; a stream 8 miles long flowing into Whitefish Creek (tributary through Salt Fork of Red River to Prairie Dog Town Fork of the Red and thus to the Mississippi).

PETTYS CREEK.—Fayette County; joins Colorado River in the southeastern part of the county; length, 4 miles.

PEVELER CREEK.—Stephens and Young counties; rises near Ivan; flows northerly 6 miles into Clear Fork of Brazos River (tributary to Brazos River) 3 miles northeast of Eliasville in southern part of Young County. Breckenridge topographic map.

PEW BRANCH.—Coryell County; a stream flowing southeasterly 9 miles into Leon River (tributary to Little River and thus to the Brazos) 4 miles east of Leon Junction in eastern part of county. Gatesville topographic map.

PEWTER FIST CREEK.—Grayson County; flows southeasterly 6 miles into East Fork of Trinity River (tributary to Trinity River) in southern part of county.

PHANTOM LAKE.—Jeff Davis County; 4 miles southwest of Toyahvale near line of Jeff Davis and Reeves counties; outlet, Toyah Creek which discharges into Pecos River (tributary to Rio Grande); small. Fort Davis topographic map.

PHILLIPS MARSH.—Bowie County; about 6 miles north of Oakgrove in northwestern part of county; an expansion of East Prong of Mill Creek (tributary to Mill Creek and thus through Red River to the Mississippi) at its mouth.

PICKET SPRING BRANCH.—Camp County; rises about 4 miles northwest of Pittsburg; flows northerly 5 miles into Big Cypress Creek (tributary to Caddo Lake and thus through Red River to the Mississippi).

PICOSO CREEK.—Maverick and Zavalla counties; rises in eastern part of Maverick County; flows eastward 22 miles to its junction with Elm Creek; (tributary to Nueces River) near Cometa in the southwestern part of Zavalla County.

PIEDRA PINTA CREEK.—Kinney County; rises 6 miles northwest of Pinto Mountain; flows southwesterly 32 miles into Rio Grande at Dixie.

PILANCILLOS CREEK.—Dimmit County; intermittent tributary to San Roque Creek (thence to the Nueces) in southeastern part of the county; flows northward 10 miles.

PILGRIM CREEK.—Armstrong and Briscoe counties; rises in southern part of Armstrong County; flows southwesterly 4 miles into Prairie Dog Town Fork of Red River (tributary to Red River, and thus to the Mississippi) in northern part of Briscoe County.

P[illegible] [illegible] miles long flowing easterly into [illegible] near Hill-Johnson County line [illegible] topographic map.

P[illegible] rises at Pilot Grove in [illegible] miles into Sister Grove Creek [illegible] and thus to the Trinity) about [illegible] County.

P[illegible] part of the county; tribu[illegible] River; length 5 miles.

P[illegible] part of county 1½ miles [illegible] miles into Cypress Creek [illegible] River, Galveston Bay, [illegible] topographic maps.

P[illegible] and Red River counties; rises about 4 [illegible] part of Lamar County; flows [illegible] (tributary to the Mississippi) near [illegible] County.

P[illegible] flows north-easterly 23 miles into Red River (tributary to the Mississippi) near the northeastern corner of the county.

P[illegible] southeasterly into Trinity River in eastern part of county.

Pine Creek.—Red River County; [illegible] of Detroit near the Lamar-Red River county line; [illegible] Bayou (tributary to Red River [illegible] Mississippi) [illegible] miles northeast of Detroit.

Pine Creek.—[illegible] County; small stream in northern part of county flowing northeasterly [illegible] Creek (tributary to Whiteoak Bayou, [illegible] Red River to the Mississippi).

Pine Creek.—Wood County; rises about one-half mile east of Quitman; flows southwesterly [illegible] Sabine River (tributary to the Sabine).

Pine Lake.—Bowie County; a small lake formed by an old channel of Red River (which discharges into the Mississippi) about 7 miles west of Index in [illegible] part of county.

Pine Lake.—Cass County; about 6 miles west of Alamo Mills in northeastern part of county; formed by an old channel of Sulphur River which discharges into Mississippi River through Red River. Texarkana and Atlanta topographic maps.

Pine Gulley.—Harris County; small intermittent stream rising 1½ miles west of Park Place and flowing easterly 2½ miles into Simms Bayou (tributary to Buffalo Bayou and Gulf of Mexico). Park Place topographic map.

Pine Fork (Upper San Bernard River).—Austin County; rises in western part; flows southeasterly 4 miles into San Bernard River, thence to Gulf of Mexico.

Piney Creek.—Austin County; rises 5 miles north of Bellville; flows southeasterly 14 miles into Brazos River.

Piney Creek.—Bastrop County; rises 2 miles south of McDade in the northern part of the county; flows southwesterly 14 miles through the north central part of the county into Colorado River at Bastrop. Bastrop topographic map.

Piney Creek.—Houston, Trinity, Polk, and Tyler counties; rises in eastern part of Houston County; flows southeasterly 57 miles into Neches River near the corner of Polk and Tyler counties.

PINEY CREEK.—Bastrop County; in the central part of the county; small stream flowing into Sandy Creek, and thus through Walrut Creek to Colorado River; length, 4 miles. Bastrop and Flatonia topographic maps.

PINEY LAKE.—(McFarland Lake); Bowie County; about 4 miles southeast of Maud in southern part of county; formerly a channel of Sulphur River (tributary through Red River to the Mississippi). New Boston topographic map.

PINE OAK CREEK.—Navarro County; joins Richland Creek (tributary to Trinity River) southwest of the town of Richland in southwestern part of county.

PINOAK CREEK.—Caldwell County; small intermittent stream; joins West Fork of Plum Creek (tributary to Plum Creek, and thus through San Marcos River to the Guadalupe) 1 mile east of Joliet. San Marcos topographic map.

PINOAK CREEK.—Colorado and Wharton counties; rises in the southern part of Colorado County; flows southeasterly through Colorado County, then southerly through Wharton County to its junction with Sandy Creek (tributary to Navidad River, then to Lavaca River, and thus to Matagorda Bay and Gulf of Mexico) in western part of Wharton County about 5 miles west of Hahn.

PINOAK CREEK.—Robertson County; rises about 3 miles south of Franklin; flows southwesterly 13 miles into Little Brazos River (tributary to Brazos River) 3½ miles south of Hearne.

PINOAK CREEK.—Fayette County; rises 4 miles northeast of Flatonia; flows northeasterly 10 miles into Buckner Creek (tributary to Colorado River) 3 miles northeast of Muldoon. Flatonia topographic map.

PINOAK CREEK.—Fayette County; small intermittent stream; rises northeast of Waelder; flows through southwestern part of county to its junction with Peach Creek (tributary to Guadalupe River). Flatonia topographic map.

PINOAK CREEK.—Fayette County; small intermittent stream; rises northeast of Waelder; flows through southwestern part of county to its junction with Peach Creek (tributary to Guadalupe River). Flatonia topographic map.

PINOAK CREEK.—Gonzales County; east of Possumtrot in northern part of county; empties into Peach Creek thence to Guadalupe River; intermittent. Flatonia topographic map.

PINOAK CREEK.—Bastrop and Fayette counties; rises near the town of Paige in Bastrop County; flows southerly 15 miles through the eastern part of Bastrop County, then 3 miles through the northwestern part of Fayette County into Colorado River 2 miles north of West Point. Bastrop and Flatonia topographic maps.

PINOAK CREEK.—Fayette County; an intermittent stream 5 miles in length flowing into Buckner Creek and thus to Colorado River in western part of county. Flatonia topographic map.

PINE ISLAND BAYOU.—Liberty, Hardin, and Jefferson counties; rises in eastern part of Liberty County; flows southeasterly 25 miles into Neches River about 6 miles north of Beaumont; tidal stream 5 miles above mouth.

PINIAS CREEK.—Jim Wells and Nueces counties; rises in northern part of Jim Wells County; flows southeastward 15 miles through Jim Wells County, then 13 miles through the western part of Nueces County into Santa Petronilla Creek (thence to Gulf of Mexico through Baffins Bay).

PINTO CANYON.—Presidio County; small intermittent tributary rising 12 miles northeast of Ruidosa in western part of county; flows southwesterly to its junction with Rio Grande 5 miles southeast of Ruidosa. Ruidosa topographic map.

Polk Hollow.—Crosby County; rises near Crosby-Dickens county line; flows southwesterly 3 miles into White River (tributary to Salt Fork of Brazos River and thus to the Brazos) in southwestern part of county.

Polk Creek.—Coleman County; rises in the central part of county; flows 9 miles into Home Creek (tributary to Colorado River). Ballinger and Coleman topographic maps.

Pollards Creek.—Palo Pinto County; rises 3 miles north of the town of Mineral Wells; flows southwestward 9 miles through Mineral Wells into the Brazos opposite Barker Mountain in eastern part of county. Palo Pinto topographic map.

Pompey Creek.—Mills County; a stream 17 miles long uniting with Blanket Creek (tributary to Colorado River through Pecan Bayou) 4½ miles southwest of Mullen in the northwestern part of the county. Brownwood topographic map.

Pond Creek.—Milam and Falls Counties; rises near Falls-Bell county line; flows southeasterly 35 miles into Brazos River, southeast of Baileyville, in the northeastern portion of Milam County. Temple topographic map.

Pond Creek.—Wichita County; rises 6½ miles southeast of Iowa Park; flows southeasterly 1 mile into Wichita River (tributary to the Red and thus to Mississippi); intermittent. West Wichita Falls topographic map.

Pond Creek, East Fork.—Wichita County; rises 6 miles northeast of Iowa Park; flows southerly 7 miles into Pond Creek (tributary to Wichita River and thus to Red and Mississippi rivers); intermittent. Burkburnett and West Wichita Falls topographic maps.

Pond Creek, West Fork.—Wichita County; rises 4 miles north of Iowa Park; flows southeasterly 9½ miles into Pond Creek and thus to Wichita, Red, and Mississippi rivers; intermittent. Clara, Iowa Park, and West Wichita Falls topographic maps.

Pond Creek, Middle Fork.—Wichita County; rises about 5 miles northeast of Iowa Park; flows southerly about 6 miles into West Fork of Pond Creek (tributary to Wichita River and thus through Red River to the Mississippi); intermittent. West Wichita Falls topographic map.

Ponton Creek.—Lavaca County; rises near Lavaca-Gonzales county line 4 miles west of Henkhaus; flows southeasterly 12 miles into Rocky Creek (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico) 6 miles east of Shiner. Flatonia topographic map.

Pony Creek.—Erath and Hood counties; rises 4 miles northwest of Skippers Gap in eastern part of county; flows northeasterly 12 miles into Paluxy Creek (tributary to Brazos River) southeast of Paluxy near Hood-Somervell county line. Stephenville and Granbury topographic maps.

Pony Creek.—Runnels County; rises southeast of Ballinger in the southeastern part of the county; flows 11 miles into Colorado River. Ballinger topographic map.

Pool Branch.—Burnet County; small stream flowing southeasterly 3½ miles to its junction with North Fork of San Gabriel River (tributary to San Gabriel River, and thus through Little River to the Brazos) at Joppa. Burnet topographic map.

Pools Creek.—San Jacinto County; small stream flowing into Trinity River northeast of Staley in the northern part of county.

Pools Creek.—Madison County; rises about 3 miles north of Madisonville in the central part of county; flows southeasterly 13 miles into Bidais Creek (tributary to Trinity River).

Poor Hollow.—Schleicher County; an intermittent stream northwest of Fort McKavett in the eastern part of the county; flows through North Valley into San Saba River (tributary to the Colorado); length, 14 miles. Fort McKavett topographic map.

Poplar Creek.—Angelina County; rises about 2 miles north of Zavalla; flows easterly 12 miles into Angelina River (tributary to Neches River) in the eastern part of the county.

Porcion Creek.—Dimmit County; rises in southern part of county; flows northeasterly about 12 miles between Catarina and Asherton into Nueces River and thus to Gulf of Mexico; intermittent.

Porter Creek.—Wharton County; small stream in western part of county; flows southerly to its junction with West Mustang Creek, and thus to Mustang Creek, Navidad and Lavaca rivers and Gulf of Mexico.

Postoak Branch.—Burnet County; small stream flowing through Smithwick in the southern part of the county; unites with Colorado River at Postoak Crossing, 2 miles south of Smithwick; length, 4 miles. Burnet topographic map.

Postoak Branch.—Stephens County; rises 2 miles west of Caddo; flows northwesterly 3½ miles into Little Cedar Creek (tributary to Big Cedar Creek, and thus to Brazos River), in easterly part of county. Breckenridge topographic map.

Post Oak Branch.—Stephens County; an intermittent stream flowing northeasterly 7 miles into Gonzales Creek (tributary to Clear Fork of Brazos River and thus to the Brazos), 1 mile south of Breckenridge. Breckenridge topographic map.

Postoak Creek.—Archer and Clay counties; rises near the county line in southwestern part of Clay County; flows northerly along the boundary of Clay and Archer counties 11 miles, and empties into Little Wichita River (tributary to Red River and thus to the Mississippi).

Postoak Creek.—Bexar Couny; an intermittent stream in southwestern part of county; flows into Elm Creek (tributary to Medina River, and thus through San Antonio River into the Guadalupe). San Antonio topographic map.

Postoak Creek.—Jones County; a short intermittent stream; flows easterly into Clear Fork of Brazos (tributary to the Brazos) near western Shackelford County line. Anson topographic map.

Postoak Creek.—Kendall and Comal counties; rises north of Van Raub; flows through the southeastern part of Kendall and the extreme southwestern corner of Comal counties into Rio Cibolo and thus to San Antonio River (tributary to the Guadalupe).

Postoak Creek.—Grayson County; rises 5 miles northwest of Sherman; flows southeasterly 11 miles into Choctaw Creek (tributary to Red River and thus to the Mississippi) about 5 miles southeast of Sherman in eastern part of county. Denison topographic map.

Postoak Creek.—Matagorda County; rises in central part of county; flows southeasterly 3 miles into Cottonwood Creek (tributary to Gulf of Mexico through Prairie Creek, Liveoak Creek, Matagorda Bay and Gulf of Mexico).

Postoak Creek.—Menard County; a stream 6 miles long in the eastern part of county; flows to San Saba River, tributary to the Colorado.

Postoak Creek.—Navarro County; small stream flowing into Richland Creek (tributary to Trinity River) in western part of county.

Postoak Creek.—Shackelford and Callahan counties; rises near Crawford, flows northerly 30 miles into Deep Creek (tributary through Hubbard and Gonzales Creeks to Clear Fork of Brazos River and thus to the Brazos) 2½ miles north of Hulltown. Albany topographic map.

Postoak Creek.—Travis County; a tributary 5 miles in length flowing through Cow Creek into Colorado River in the northwestern part of the county. Burnet topographic map.

Pot Creek.—Fannin County; rises in southeastern part of county; empties into Brushy Creek (tributary to North Sulphur River, thence to Sulphur River and thus through Red River to the Mississippi).

Potter Creek.—Comal County; near Cranes Mill; small intermittent stream flowing through northeastern part of county into Guadalupe River.

Potter Creek.—Harrison County; rises about 3 miles northwest of Marshall; flows southerly 14 miles into Sabine River.

Potrance Creek.—Bexar County; rises northwest of Macdona in the western part of the county; flows into Medina River (tributary to San Antonio River thence to the Guadalupe); intermittent. San Antonio topographic map.

Powell or Lick Creek.—Cass County; rises about 3 miles east of Cusseta in northern part of county; flows northeasterly 9 miles into Sulphur River (tributary to Red River, which discharges into the Mississippi) about 1½ miles west of Pettes Bridge. About 2 miles south of its mouth the stream widens into Overcup Pond the outlet of which is known as Overcup Slough. Linden topographic map.

Powder Creek.—Fannin County; rises about 2 miles west of Bonham in central part of county; flows easterly 3 miles into Bois d'arc Creek (tributary to Red River which discharges into the Mississippi) about a mile east of Bonham.

Powderhorn Bayou.—Calhoun County; rises in the eastern part of the county; flows easterly 7 miles into Matagorda Bay and thus to Gulf of Mexico.

Powdermill Creek.—Burnet County; flows into Colorado River 2½ miles northeast of Kingsland in the southern part of the county; length, 3 miles. Burnet topographic map.

Prairie Bayou.—Nacogdoches County; small stream flowing into Bayou Pontizella (tributary to Bayou Atascosa, and thus through Bayou Carrizo to Angelina and Neches rivers) in eastern part of county.

Prairie Branch.—Cass County; rises about 4 miles west of T. P. sawmill; flows into Bee Creek (tributary to Johns Creek, thence through Frazier Creek to Caddo Lake and thus through Red River to the Mississippi) in northern part of county; intermittent.

Prairie Branch.—Montague and Clay counties; an intermittent stream flowing in Big Sandy Creek (tributary to West Fork of Trinity River, thence to the Trinity) in southeastern part of Clay County and southwestern part of Montague County. Montague topographic map.

Prairie Creek.—Anderson County; small stream flowing into Hurricane Creek (tributary to Neches River) in the eastern part of county.

Prairie Creek.—Camp County; rises about 5 miles south of Pittsburg; flows eastward 12 miles into Richland Creek (tributary to Big Cypress Creek and thus through Caddo Lake and Red River to the Mississippi) in the southeastern part of the county.

Prairie Creek.—Colorado County; rises in the western part of the county; flows southwesterly 3 miles into Navidad River (tributary to Lavaca River, thence to Matagorda Bay and Gulf of Mexico).

Prairie Creek.—Colorado County; rises at Weimar; flows southwesterly 6 miles into Navidad River (tributary to Lavaca River, thence to Gulf of Mexico through Matagorda Bay) near Lavaca-Colorado county line.

Prairie Creek.—Dallas County; rises 1 mile north of Arnold; flows southerly 11 miles into Trinity River about 1 mile north of Doddys Ferry. Dallas topographic map.

PRAIRIE CREEK.—Fayette County; in central part of county; tributary through Buckners Creek to Colorado River; length, 4 miles. Flatonia topographic map.

PRAIRIE CREEK.—Franklin County; rises at Mount Vernon in central part of county; flows northerly 6 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

PRAIRIE CREEK.—Hood and Somervell counties; an intermittent stream 4 miles in length flowing southerly into Paluxy Creek (tributary to Brazos River) 3 miles southeast of Paluxy in northwestern part of Somervell County. Granbury topographic map.

PRAIRIE CREEK.—Jasper County; rises near Jasper; headwater stream of Walnut Creek (tributary to Neches River); flows westerly 6 miles.

PRAIRIE CREEK.—Matagorda County; rises in the central part of the county; flows southeasterly 18 miles to its junction with Live Oak Creek, and thus to Matagorda Bay and Gulf of Mexico. About 1 mile above its mouth this stream forms a lake known as Lake Austin.

PRAIRIE CREEK.—Smith County; small stream flowing into Little Saline Creek (tributary to Sabine River) northwest of Winona in northern part of county.

PRAIRIE CREEK.—Smith and Gregg counties; rises about 12 miles east of Tyler in Smith County; flows easterly 14 miles into Sabine River in the western part of Gregg County about 5 miles southeast of Gladewater.

PRAIRIE CREEK.—Smith County; a southwesterly flowing stream 9 miles long emptying into Neches River northwest of Tyler in western part of county.

PRAIRIE CREEK.—Smith County; flows southerly 11 miles; empties into East Fork of Mud Creek (tributary to Mud Creek and thus through Angelina River to the Neches) in southeastern part of county.

PRAIRIE CREEK.—Shelby County; rises in central part of county; flows southerly 7 miles into South Tancha Bayou (tributary to Tancha Bayou and thus to Sabine River) about 2 miles north of Shelbyville.

PRAIRIE CREEK.—Terrell County; rises in southern part, 3 miles east of McClain Ranch; flows easterly; intermittent. Dryden Crossing topographic map.

PRAIRIE CREEK.—Upshur County; rises in northwestern part of county; flows southeasterly 9 miles into Little Cypress Creek (tributary to Caddo Lake, thence through Red River to the Mississippi) northwest of Gilmer.

PRAIRIE DOG TOWN FORK OF RED RIVER.—Curry County, N. Mex., Deaf Smith, Parker, Randall, Armstrong, Briscoe, Hall, Childress, Hardeman, and Wilbarger counties, Tex.; rises in "Head Breaks" of Red River about 20 miles west of the Texas-New Mexico boundary line, in northern part of Curry County, N. Mex.; flows easterly 280 miles to its junction with North Fork of Red River to form Red River (tributary to Mississippi River) about 2 miles east of Doans in northern part of Wilbarger County, Tex.

PRAIRIE MOUNTAIN SPRING BRANCH.—Llano County; a small intermittent stream flowing into Bullhead Creek and thus to Hickory Creek (tributary through the Llano to Colorado River) northeast of Starkes in the southwestern part of the county; length, 3 miles. Llano topographic map.

PRESCOTT CREEK.—Mills County; a stream 6 miles long joining Colorado River 2 miles south of Big Valley in the southern part of the county. San Saba topographic map.

PREWETTS CREEK.—Madison County; rises in southwestern corner of county; flows southwesterly 5½ miles into Navasota River (tributary to Brazos River) west of Cross.

PREWITT LAKE.—Cass County; northeast of Avinger; an expansion of Black Cypress Bayou (tributary to Big Cypress Bayou, thence through Caddo Lake to Red River and thus to the Mississippi). The lake is 1 mile long and 5 miles wide.

PRICE CREEK.—Collin County; rises 2 miles east of Copeville; flows southwesterly 6 miles into Sister Grove Creek (tributary to East Fork of Trinity River and thus to the Trinity) about a mile southeast of Clear Lake.

PRICES CREEK.—Dewitt County; rises 11 miles southeast of Cuero; flows through southeastern part of county into Guadalupe River.

PRICKLY PEAR CREEK.—Bastrop County; an intermittent stream rising near Royston Hill in the southern part of the county; flows southeasterly 5 miles into Borden Creek (tributary to Colorado River) near southeastern county line. Flatonia and Bastrop topographic maps.

PRICKLY PEAR CREEK.—Gonzales County; small intermittent stream flowing through town of Gonzales into Guadalupe River. Flatonia topographic map.

PRIETO CREEK.—Lasalle and Webb counties; rises in southeastern part of Webb County; flows northward 40 miles to its junction with Nueces River in La Salle County, a few miles below mouth of Salado Creek.

PROCELLA CREEK.—Angelina County; a stream 5 miles long flowing into Angelina River (tributary to Neches River) in the northwestern part of county.

PUENTE DE PIEDRA OR SULPHUR CREEK.—Live Oak and Bee counties; rises in the northwest corner of Bee County; flows southwesterly 9 miles through Bee County and 18 miles through Live Oak County into Nueces River about 1 mile west of Oakville.

PULLIAM CREEK.—Edwards County; a spring-fed creek, in the eastern part of the county; formed by the junction of Hackberry and Polecat Creeks; flows southeasterly 15 miles to its junction with East Nueces River, thence to Nueces River, 3 miles south of Barksdale. Nueces topographic map.

PURGATORY CREEK.—Hays County; south of the town of San Marcos; flows into San Marcos River and thence to Guadalupe River; intermittent. San Marcos topographic map.

PURTIS CREEK.—Van Zandt and Henderson counties; rises in southwestern part of Van Zandt County; flows southwesterly into Twin Creek (tributary to Cedar Creek, thence to Trinity River) in southwestern part of Henderson County.

QUAIL CREEK.—Donley County; small stream in northeastern part of county flowing into Whitefish Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of Red River to Red and Mississippi rivers).

QUAPAW CREEK.—Smith County; flows easterly 4 miles into Hays Creek (tributary through Prairie Creek to East Fork of Mud Creek, and thus through Mud Ceek to Angelina and Neches rivers) in southeastern part of county.

QUARRY CREEK.—Runnels County; southwest of Vale in western part of the county; flows into Valley Creek and thus to the Colorado; length, 10 miles. Hayrick topographic map.

QUEENS CREEK.—Dewitt County; small tributary to Guadalupe River in northern part of county near Hochheim.

QUICKSAND CREEK.—Newton County; rises about 6 miles southeast of Farrsville; flows southeasterly 14 miles into Sabine River.

QUIL MILLER CREEK.—Johnson County; rises 1½ miles southwest of Marystown; flows northerly 10 miles into Village Creek (tributary to West Fork of Trinity River, thence to the Trinity) about 2 miles south of Oak Grove, near the Tarrant-Johnson county line. Cleburne and Fort Worth topographic maps.

QUITAQUE CREEK.—Floyd and Motley counties; rises in northeastern part of Floyd County; flows northeasterly 20 miles into Pease River (tributary to Red River and thus to the Mississippi) in northern part of Motley County.

QUITMAN ARROYO.—El Paso County; an intermittent stream rising 8 miles west of Sierra Blanca and flowing southeasterly 33 miles into Rio Grande 28 miles southeast of Sierra Blanca. Sierra Blanca and Eagle Mountain topographic maps.

RABBIT CREEK.—Rusk and Gregg counties; rises about 2 miles north of Overton in Rusk County; flows northeasterly 17 miles into Sabine River in Gregg County about 3 miles southwest of Longview.

RABBITS EAR CREEK.—Dallam, Sherman, and Hansford counties; rises near Clayton, N. Mex., enters Texas near the northwestern corner of Dallam County and flows southeasterly to Sherman-Hansford county line, 15 miles east of Coldwater; thence takes a northeasterly course to Oklahoma-Texas State line, 23 miles northwest of Hansford; unites with Coldwater Creek (tributary to Beaver River thence through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 9 miles southeast of Guymon, Okla.; intermittent.

RABBS CREEK.—Lee and Fayette counties; rises in the southern part of Lee County; flows southerly 7 miles through Lee County, then 9 miles through Fayette County to its junction with Colorado River 5 miles above Lagrange. Bastrop topographic map.

RACCOON CREEK.—Bowie County; a small stream about 3 miles southwest of New Boston flowing into Rice Creek (tributary through Anderson Creek to Sulphur River and thus through Red River to the Mississippi). New Boston topographic map.

RACE CREEK.—Young County; small stream flowing easterly 3 miles to a point 4 miles northwest of Proffitt in western part of Young County, where it enters Boggy Creek (tributary to Brazos River).

RAGGEDY CREEK.—Foard County; rises about 3 miles west of Crowell in northern part of county; flows northeasterly 10 miles into Pease River (tributary to Red River and thus to the Mississippi) about 3½ miles northwest of Margaret.

RAIN CREEK.—Bowie County; rises 1 mile southeast of Leary in eastern part of county; flows northerly into Big Creek (tributary to Red River, which discharges into the Mississippi). Texarkana topographic map.

RAINBOW CREEK.—Hunt County; rises about 4 miles west of Wolfe City in northern part of county; empties into South Sulphur River (tributary to Sulphur River and thus through Red River to the Mississippi).

RAINY CREEK.—Taylor County; rises 5 miles southeast of Elmdale; flows northwestward 12 miles into Lytle Creek (tributary through Elm Creek to Clear Fork of Brazos River and thus to the Brazos) 4 miles north of Abilene in northeastern part of county. Abilene topographic map.

RAIZ CREEK.—Nacogdoches County; flows southerly 5 miles into Nacoste Creek (tributary through Bayou Loco to Angelina River and thus to the Neches) in western part of county.

RANCH CREEK.—Mason County; a stream 6 m… northern part of the county to the west of… (tributary to Colorado River). Mason topog…

RANCHERIAS CANYON.—Presidio County; rises 4… flows southwesterly 8 miles into Rio Grande… in southern part of county. Polvo and Terli…

RANCHEROS OR COMANCHE CREEK.—Uvalde and Me… north of Sabinal; flows southeasterly and sou… River (tributary through Frio River to the… Sabinal.

RANDOLPH CREEK.—Guadalupe County; small inter… Salem School in the east-central part of the cou… and thus to Guadalupe River. San Marcos topo…

RANGE CREEK.—Grayson County; rises 4 miles south… southwesterly 13 miles to its confluence with Jord… Bois Creek (which discharges into Trinity Riv… the Trinity) about 3 miles south of Collinsville. …

RANNEY CREEK.—McLennan and Coryell counties; an… ing at Coryell City in northern part of Coryell Co… easterly 7 miles into Middle Bosque River (trib… thence through Bosque River to the Brazos) in the… nan County. Meridian topographic map.

RATTLESNAKE CREEK.—Montague County; about 2 miles… School; unites with Belknap Creek (tributary to Red… Mississippi) in northwestern part of county; intermit… topographic map.

RAVEN CREEK.—Fisher County; an intermittent stream ris… of Eskota and flowing northeasterly 9 miles into C… River (tributary to the Brazos) in southeastern corn… topographic map.

RAVEN CREEK.—Wheeler and Collingsworth counties; rises… part of Wheeler County; flows southeasterly 6 miles… Red River (tributary through North Fork of Red Riv… thus to the Mississippi) in northeastern part of Colling…

RAWHIDE CREEK.—Dallas County; small stream joining Farm… tary to Elm Fork of Trinity River and thus to the Trini… of Farmers Branch. Dallas topographic map.

RAW MEAT CREEK.—McMullen County; small stream flowing… Creek (tributary to Frio River and thus to the Nueces)… part of the county; length, 4 miles.

RAY CREEK.—Harrison County; rises about 2 miles northwes… central part of county; flows northwesterly 7 miles int… Bayou (tributary to Caddo Lake and thus through Re… Mississippi.)

REAGAN CANYON.—Brewster County; rises in southeastern… northeast of Dove Mountain; flows northeasterly, southweste… easterly 11 miles into Rio Grande; intermittent. Dove M… Gap, and Reagan Canyon topographic maps.

REBECCA CREEK.—Blanco and Comal counties; rises in southern… County; joins Guadalupe River in northern part of Comal… of Spring Branch.

RED ARROYO.—Hall County; rises in central part of country; flows northerly 8 miles into Little Red River (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi).

RED BAYOU.—Bowie County; about 8 miles north of Malta in northern part of county; takes an easterly course for 6¼ miles; connecting channel of a series of bends in Red River (tributary to Mississippi River).

RED BRANCH.—Lee County; a small intermittent stream flowing southward into Second Yegua Creek (tributary to Yegua Creek and thus to the Brazos) southeast of Lexington. Bastrop topographic map.

RED MOUNTAIN BRANCH.—San Saba County; a small intermittent stream in the southern part of the county; joins Pecan Creek (tributary through Llano River to the Colorado) 4 miles southwest of Taylorville; length, 3 miles. Llano topographic map.

RED CREEK.—Bowie County; rises about 2½ miles northwest of New Boston in northern part of county; flows northeasterly 8 miles into Red River (tributary to the Mississippi). New Boston topographic map.

RED CREEK.—Donley County; small stream flowing through eastern part of county into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through the Red to the Mississippi).

RED BANK CREEK.—Garza County; rises in northwest part of county; flows easterly into North Fork of Double Mountain Fork of Brazos River (tributary to the Double Mountain Fork of the Brazos, thence to Brazos River).

RED BANK CREEK.—Parker and Hood counties; flows northerly 2½ miles into Brazos River 2 miles southeast of Buckner in southwestern part of county. Weatherford topographic map.

RED BANK CREEK.—Tom Green County; rises northeast of San Angelo; flows through the northeastern part of the county into Concho River and thus to the Colorado; length, 18 miles. Hayrick topographic map.

REDBUD CREEK.—Montague County; a small intermittent stream rising near Red Bud School and flowing to Farmers Creek (tributary to Red River and thus to the Mississippi) in northern part of county. Montague topographic map.

RED DEER CREEK.—Hemphill, Roberts, and Gray counties; rises near Pampa in northwestern part of Gray County; takes a northeasterly course through Roberts and Hemphill counties; flows into Canadian River (tributary to Arkansas River and thus to the Mississippi) a mile northwest of Canadian in northwestern part of Hemphill County; length, 35 miles.

RED FORK RUSH CREEK.—Eastland and Erath counties; rises 2 miles south of Rattlesnake Mountain in eastern part of Eastland County; flows northerly 11 miles into South Palo Pinto Creek (tributary through Palo Pinto Creek to Brazos River) 2 miles west of McQuirt Mountain. Stephenville topographic map.

REDGATES CREEK.—Colorado County; tributary through Cummins Creek to Colorado River in northern part of the county; length, 9 miles.

REDHOT CREEK.—Donley County, a stream 2 miles long flowing southerly through eastern part of county into McCormick Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red to Red and Mississippi rivers).

REDMUD CREEK.—Donley County; a stream 2 miles long flowing southeasterly through eastern part of county into McCormick Creek (tributary to Salt Fork of Red River and thus through Prarie Dog Town Fork of the Red to Red and Mississippi rivers).

Redmud Creek.—Jones County; rises near Anson in central part of county; flows northeasterly 12 miles into California Creek (tributary to Clear Fork of Brazos River and thus to the Brazos) 4 miles west of Avoca; intermittent. Anson topographic map.

Redoak or Bullock Creek.—Dallas and Ellis counties; rises in the town of Cedar Hill in Dallas County; flows southeasterly 30 miles into Trinity River in the northeastern part of Ellis County. Dallas topographic map.

Redoak Creek.—Robertson County; small stream flowing southeasterly 7 miles into Navasota River (tributary to Brazos River) at the International and Great Northern Railway crossing in eastern part of county.

Redrock Creek.—Llano County; a stream 5 miles southwest of Bluffton in the eastern part of the county; flows 7 miles into Colorado River; intermittent. Burnet topographic map.

Red Gulley.—Bastrop County; northwest of Caldwell in the western part of the county; a small intermittent stream flowing into Moss Branch and thus through Dry Creek to Colorado River; length, 3 miles. Austin and Bastrop topographic maps.

Red Gulch.—Motley County; rises about 5 miles south of Northfield in northeastern part of county; flows northeasterly 4 miles into Sisk Creek (tributary to Pease River and thus through Red River to the Mississippi).

Redmond Branch.—Cooke County; small intermittent stream flowing to Pecan Creek (tributary through Elm Fork of the Trinity to Trinity River) southeast of the town of Gainesville. Gainesville topographic map.

Red River.—Formed in the southeastern part of Panhandle of Texas by the union of a number of headwater streams; Prairie Dog Town Fork, which drains the large area and is therefore considered the continuation of the main stream, rises in the extreme western part of Deaf Smith County, the watershed extending into New Mexico at an approximate elevation of 4,500 feet above sea level; from its source it takes a general southeasterly course about 200 miles, crosses the Plains and Panhandle counties of Texas, and flows to a point on the east line of Childress County where it intersects the Texas-Oklahoma boundary line, thence along the boundary between Texas and Oklahoma approximately 440 miles, and along the Texas-Arkansas State line 40 miles; from the northwestern corner of Texas the stream turns abruptly to the south, flows about 60 miles through a corner of Arkansas, thence approximately 220 miles through Louisiana entering Mississippi River in Avoyelles Parish, La. Area of drainage basin in Texas, 30,700 square miles. Principal tributaries in Texas: Sulphur, Wichita and Pease rivers, and Salt and North forks of Red River.

In its upper drainage across the Plains country the stream is but little more than a dry channel which in places is poorly defined and carries water only during times of heavy precipitation; its first perennial flow begins in Randall, Armstrong, and Briscoe counties and is derived from springs in the canyons which are cut to a depth of several hundred feet. East of Grayson County it passes through a timbered country of heavy precipitation and the flow of the stream is augmented by many tributaries until in the low lands of Louisiana, east of the Texas boundary, it becomes a maze of swamps.

Comparatively little economic use is made of its waters, the principal reason being that where water is needed for irrigation there is a deficient supply. Extensive use for power, irrigation and municipal purposes is made on some of its tributaries. Montague, Gainesville, and Denison topographic maps.

REED CREEK.—Gonzales County; a small intermittent stream in the northwestern part of the county flowing into Sandy Fork of Peach Creek (tributary to Peach Creek and thus to Guadalupe River) west of Thompsonville. Flatonia topographic map.

RED CREEK.—Gonzales County; south of Waelder in northern part of county; small intermittent tributary to Sandy Fork of Peach Creek, and thus through Peach Creek to Guadalupe River. Flatonia topographic map.

REED CREEK.—Llano County; an intermittent tributary to Little Llano River (and thus through Llano River to the Colorado) at Lone Grove in the northeastern part of the county; length, 5 miles. Llano topographic map.

REESE CREEK.—Bell County; an intermittent stream flowing southerly to a point 3½ miles west of Youngsport, where it enters Little River (tributary to the Brazos); length, 7 miles. Gatesville and Georgetown topographic maps.

RENHARDT BAYOU.—Harris County; rises 4 miles southwest of Humble; flows southeasterly 3½ miles into Garners Bayou and thus to Buffalo Bayou and Gulf of Mexico; intermittent. Humble topographic map.

RESACA CREEK.—Leon County; rises in northeastern part; flows northeasterly 7 miles into Buffalo Creek (tributary to Upper Keechi Creek, thence to Trinity River).

RESACA DE ENMEDIO.—Jim Wells County; a small tributary to Chiltipin Creek (thence to Gulf of Mexico through Pinias Creek, Santa Petronilla Creek, and Baffins Bay) in northern part of county.

RESLEY CREEK.—Erath and Comanche counties; rises near Dublin in southern part of Erath County; flows southeasterly 24 miles into Leon River (tributary through Little River to the Brazos) near Comanche-Hamilton County line, 2 miles north of Gentry Mill. Stephenville and Hamilton topographic maps.

REUBES CREEK.—Menard, Concho, and McCulloch counties; a stream joining South Brady Creek (tributary to Brady Creek and thus through San Saba River to the Colorado) 13 miles west of Brady in the southwestern part of McCulloch County; length, 13 miles. Eden topographic map.

REYNOLDS BRANCH.—Shackelford County; flows easterly 3½ miles to a point 1 mile north of Fort Griffin, where it enters Clear Fork of Brazos River (tributary to Brazos River) in northern part of county. Albany topographic map.

REYNOLDS CREEK.—Shackelford County; a stream flowing easterly 7 miles into Hubbard Creek (tributary through Gonzales Creek to Clear Fork of Brazos River and thus to the Brazos) at Greer Mountain southeast of Albany in southern part of county. Albany topographic map.

RHODA LAKE.—Armstrong County; about 7 miles southwest of Claude; an expansion of Mulberry Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi); area, about three-fourths square mile.

RICARDO OR POLANS CREEK.—Val Verde County; an intermittent stream rising in the northeastern part of the county and flowing southerly approximately 10 miles into Devils River (tributary to Rio Grande).

RICES CANYON.—Brewster County; a canyon entering Tornilla Creek (tributary to Rio Grande) 6 miles northwest of Boquillas in southern part of county; flow intermittent. Chisos Mountain topographic map.

RICE CREEK.—Bowie County; rises about 3 miles northwest of New Boston; flows southeasterly 12½ miles into Anderson Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 2 miles west of Corley in southern part of county. New Boston topographic map.

RICHARDS OR TWELVEMILE CREEK.—Austin County; rises 2 miles northwest of Wallis; flows northeasterly 2 miles into Allens Creek (tributary to Brazos River) 1½ miles north of Wallis in southern part of county.

RICHARDSON CREEK.—Erath and Hood counties; rises 1 mile north of Bunker Hill in eastern part of Erath County; flows northeasterly 16 miles into Paluxy Creek (tributary to Brazos River), 1 mile northwest of the village of Paluxy. Stephenville and Granbury topographic maps.

RICHARDSON CREEK.—Collingsworth County; a stream 4 miles long flowing southerly through northwestern part of county into Willis Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red to Red River, thence to the Mississippi).

RICHERSON LAKE.—Bowie County; about 3 miles south of Bassett in southwestern part of county; formed by old Sulphur River Channel (tributary to Red River and thus to the Mississippi).

RICHLAND CREEK, EAST FORK OF.—Delta County; rises 5 miles northwest of Cooper; flows southeasterly 6 miles into Richland Creek (tributary to South Sulphur River, thence through Sulphur River to Red River and thus to the Mississippi) about 1½ miles east of Cooper.

RICHLAND CREEK.—Hill, Navarro, and Freestone counties; rises 3½ miles east of Itasca in northern part of Hill County; flows easterly 50 miles into Trinity River in the northern corner of Freestone County. Cleburne topographic map.

RICHLAND CREEK.—Delta County; rises about 5 miles northwest of Cooper in western part of county; flows southeasterly 11 miles into South Sulphur River (tributary to Sulphur River, and thus through Red River to the Mississippi) about 5 miles southeast of Cooper.

RICHLAND CREEK.—Hopkins County; a stream in the eastern part of county flowing northerly 8 miles into Whiteoak Bayou (tributary to Sulphur River, and thus through Red River to the Mississippi).

RICHLAND CREEK, SOUTH FORK.—Hill and Navarro counties; small stream flowing into Richland Creek (tributary to Trinity River).

RICHLAND CREEK, NORTH FORK.—Hill and Navarro counties; rises in eastern part of Hill County; flows southeasterly into Richland Creek (tributary to Trinity River) in western part of Navarro County.

RICHLAND CREEK.—Goliad County; small tributary to Blanco Creek (thence to Gulf of Mexico through El Sarco River, Rio de la Mission and Copano Bay) in southwestern part of the county.

RICHLAND CREEK.—Sabine County; rises near the southern boundary of the county; flows northeasterly 8 miles into Sixmile Creek, and thus to Sabine River.

RICHLAND CREEK.—San Saba County; rises 4 miles south of Cowboy near the San Saba-McCulloch county line; flows southeasterly 23 miles through Richland Springs into San Saba River (tributary to the Colorado) 4½ miles northwest of San Saba. Brady and San Saba topographic maps.

RICHLAND CREEK.—Terrell County; rises about 20 miles south of Sheffield; flows through western part of county in a southeasterly direction 6 miles into Pecos River (tributary to Rio Grande) 18 miles south of Old Fort Lancaster and Sheffield.

RICHLAND CREEK.—Upshur and Camp counties; rises about 4 miles southwest of Lafayette in northern part of Upshur County; flows northeasterly 9 miles into Big Cypress Bayou (tributary to Caddo Lake, thence to Red River, and thus to the Mississippi) in southeastern part of Camp County.

Richmans Creek.—Polk County; small stream flowing into Bear Creek (tributary to Alabama Creek, and thus to Neches River) in the east central part of the county.

Rinard Creek.—Travis County; a small intermittent tributary in the southeastern part of the county flowing northward 4 miles from the town of Carl into Onion Creek, and thus to the Colorado. Austin topographic map.

Ringgold Creek.—Leon County; small stream flowing into Boon Creek (tributary to Trinity River) about 5 miles northwest of Navarro.

Rio Branch.—Cooke County; small intermittent stream flowing through southwestern part of county into Clear Creek, and thus through Elm Fork of Trinity River to the Trinity. Gainesville topographic map.

Rio Cibolo.—Kendall, Comal, Bexar, Guadalupe, Wilson, and Karnes counties; rises 8 miles northwest of Boerne in the southern part of Kendall County; flows southeasterly 12 miles through Kendall County, then along the boundary of Bexar and Comal counties for 30 miles; 27 miles along boundary of Guadalupe and Bexar, then 6 miles between Guadalupe and Wilson, thence 26 miles through Wilson, then 11 miles through Karnes into San Antonio River (tributary to the Guadalupe) near the town of Pana Maria in the central part of Karnes County.

Rio de la Mission.—Refugio County; formed near Refugio in the center of the county by union of El Sarco River and Medio Creek; flows southeastward 15 miles into Mission Bay (an arm of Gulf of Mexico through Copano Bay).

Rio Grande.—Rises near crest of Continental Divide, on eastern slope of San Juan Mountains, in the southwestern part of the State of Colorado; flows in general southeasterly, crosses the State of New Mexico, continues in a southeasterly course to a point east of Brownsville, Tex., where it enters the Gulf of Mexico. Drainage area in Texas, 20,700 square miles. Gaging stations near El Paso (1889–1893, 1895–1915), Fort Hancock (1900–1903), Langtry (1900–1914), Devils River, below mouth (1900–1914), Eagle Pass (1900–1914), near Laredo (1900–1914), Roma (1900–1914), Brownsville (1900–1914), and above and below Presidio (1900–1914).

This stream forms the international line between the United States and Mexico from a point a short distance above the city of El Paso to its mouth, a distance of approximately 900 miles. For the greater part of this distance it flows through picturesque rock canyons, emerging therefrom above its mouth, where it enters the delta. Frequently there is no flow at El Paso, but the tributaries below furnish water for lands in the lower drainage basin. Use is made of its waters for irrigation along its course, but water power is not developed. See Second Report of Texas Board of Water Engineers for list of certified filings for appropriations of water.

The principal tributaries are Pecos and Devils rivers, from the State of Texas.

The precipitation increases at a fairly uniform rate from a point near El Paso to the mouth of Pecos River, ranging from 9 to 19 inches; from this point it increases rapidly, reaching 25 inches at the mouth of the stream. El Paso, Rio Grande, Fort Hancock, Eagle Mountain, Chispa, San Carlos, Ruidosa, Shafter, Polvo, Terlingua, and Chisos Mountain topographic maps.

Ripley Creek.—Franklin and Titus counties; rises 3 miles south of Mount Vernon in the eastern part of Franklin County; flows northeasterly 11 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi) in northwestern part of Titus County.

RIPPY BRANCH.—Parker County; Rises in northwestern part of county; flows southwesterly 7 miles into Rock Creek (tributary to Brazos River) one-half mile west of Blue Spring. Weatherford and Palo Pinto topographic maps.

ROARK CREEK.—Cherokee County; small stream emptying into Angelina River (tributary to the Neches) north of Forest in southeastern part of county.

ROBERTS CREEK.—Floyd and Motley countries; rises in northeastern part of Floyd County; flows northeasterly 8 miles into Quitaque Creek (tributary through Pease River to the Red and thus to Mississippi River) in northwestern part of Motley County.

ROAN GULLY.—Harris County; rises in northwestern part of county 1 mile southeast of Hufsmith; flows southeasterly 2 miles into Willow Creek (tributary to Spring Creek, San Jacinto River, and thus through Galveston Bay to Gulf of Mexico); intermittent. Louetta topographic map.

ROBERTSON BAYOU.—Chambers County; a small tidal stream in the southern part of the county; takes an irregular southeasterly course into East Galveston Bay; thence to Gulf of Mexico; length, 3 miles.

ROBERTSON CREEK.—Nolan County; rises west of Hylton in the southeastern part of the county; flows 8 miles into Oak Creek (tributary to Colorado River). Sweetwater topographic map.

ROBINSON BRANCH.—Johnson County; rises 2 miles northwest of Bono in western part of county; flows southeasterly 7 miles into Nolands River (tributary to the Brazos) southwest of Cleburne. Granbury and Cleburne topographic maps.

ROBINSON BRANCH.—Burnet County; small stream flowing 2½ miles northerly into Russell Fork of San Gabriel River (tributary through the North Fork of San Gabriel River to the San Gabriel and thus to Little and Brazos rivers) northeast of Burnet. Burnet topographic map.

ROBINSON CREEK.—Hood County; rises near Erath-Hood County line; flows northeasterly 15 miles into Brazos River, 3 miles north of Thorps Springs in northern part of county. Granbury and Weatherford topographic maps.

ROBINSON CREEK.—Jasper County; a stream 6 miles long flowing southwesterly into Big Creek (tributary to Neches River) in western part of county.

ROBISON CREEK.—Fayette County; small intermittent tributary joining Colorado River 1½ miles northwest of West Point in the northwestern part of the county; length, 4 miles. Flatonia topographic map.

ROCHELLE CREEK.—Bowie County; an intermittent stream 3 miles long flowing southeasterly to its junction with Langum Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 3 miles southeast of Redwater in southeastern part of county. Texarkana topographic map.

ROCK BAYOU.—Harris County; rises in the northwestern part of the county; flows easterly and northeasterly 21 miles into Cypress Creek (tributary through Spring Creek to San Jacinto River and thus to Galveston Bay and Gulf of Mexico) 5 miles east of Cypress.

ROCK CREEK.—Cooke County; a small stream flowing into Pecan Creek (tributary through Elm Fork of Trinity to the Trinity) northwest of the town of Gainesville. Gainesville topographic map.

ROCK CREEK.—Smith County; a stream about 6 miles long flowing northeasterly into Sabine River about 3 miles west of point where the International & Great Northern Railroad crosses this stream in northwestern part of county.

ROCK CREEK.—Bosque County; a stream 4½ miles long flowing northerly into Brazos River at Brazos Point, in extreme northern part of county. Granbury topographic map.

ROCK CREEK.—Bowie County; rises about 1½ miles southwest of Whaleys; flows southerly 7 miles into Langum Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 1½ miles northwest of Maud, in central part of county. New Boston topographic map.

ROCK CREEK.—Gonzales County; small stream in southern part of the county; flows into Elm Fork of Sandies Creek (tributary to Sandies Creek and thus to Guadalupe River.)

ROCK CREEK.—Goliad County; small stream in northwestern part of county flowing through Coleto Creek to Guadalupe River.

ROCK CREEK.—Grayson County; small intermittent stream flowing into Red River (tributary to Mississippi) in extreme northwestern part of county. Denison topographic map.

ROCK CREEK.—Gregg County; small tributary to Prairie Creek and thus to the Sabine River in western part of county.

ROCK CREEK.—Hopkins County; rises about 4 miles south of Sulphur Springs; flows northeasterly 9 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

ROCK CREEK.—Jack and Palo Pinto counties; a stream flowing southerly 13 miles along the west line of Jack County to its junction with Brazos River, three-fourths of a mile east of southeast corner of Young County. Palo Pinto topographic map.

ROCK CREEK.—Hutchinson and Carson counties; an intermittent stream rising 10 miles north of Panhandle, in northern part of Carson County, and flowing northerly into Canadian River (tributary through Arkansas River to the Mississippi) 6 miles southwest of Plemons, in southwestern part of Hutchinson County.

ROCK CREEK.—Johnson and Tarrant counties; rises north of Brushy Knob, in Johnson County; flows northerly 12 miles into Clear Fork of Trinity River (tributary to West Fork of Trinity River and thus to the Trinity) about 4 miles south of Benbrook. Cleburne and Fort Worth topographic maps.

ROCK CREEK.—Lamar County; rises about a mile southwest of Brookston, in southwestern part of county; flows southeasterly 11 miles into North Sulphur River (tributary through Sulphur River to Red River and thus to the Mississippi), in southwestern part of county, at southern boundary.

ROCK CREEK.—McLennan County; rises about 2 miles north of China Springs, in western part of county; flows northeasterly 8 miles into Brazos River. Waco topographic map.

ROCK CREEK.—Parker and Jack counties; rises in southeast corner of Jack County; flows southerly 24 miles into Brazos River 4 miles southwest of Millsap in western part of Parker County. Weatherford and Palo Pinto topographic maps.

ROCK CREEK.—Uvalde County; intermittent stream in northern part of county; flows southeastward 7 miles to its junction with Dry Frio River (tributary to the Nueces through Frio River) 1 mile south of Davenport ranch. Uvalde topographic map.

ROCK FORK OF NAVIDAD RIVER.—Fayette County; rises east of the town of Flatonia; flows eastward 9 miles into West Fork Navidad River (tributary through Navidad River to the Lavaca and thence to Matagorda Bay and Gulf of Mexico) 3 miles west of Schulenburg. Flatonia topographic map.

ROCKPOOL GULLY.—Harris County; rises 5½ miles east of Moonshine Hill; flows northeasterly 1½ miles into San Jacinto River and thus to Gulf of Mexico. Intermittent. Moonshine Hill topographic map.

ROCK SPRINGS CREEK.—Gray and Donley counties; rises in southern part of Gray County; flows southeasterly 8 miles into Whitefish Creek (tributary to Salt Fork of Red River, Prairie Dog Town Fork of Red River, and thus through Red River to the Mississippi), in northeastern part of Donley County.

ROCK TANK CREEK.—Johnson County; small stream flowing into South Fork of Pecan Creek (tributary to Pecan and Richland creeks, thence to the Trinity) southeast of Cuba, in eastern part of county. Cleburne topographic map.

ROCKHOUSE DRAW.—El Paso County; an intermittent stream in central part of county near southern edge of Hueco Mountains; flows southerly 9 miles and sinks in the sands 27 miles north of Fort Hancock. Cerro Alto topographic map.

ROCKWALL CREEK.—Scurry County; rises in northeast corner of county; flows northeasterly 5 miles into Rough Creek (tributary through Double Mountain Fork of Brazos River to the Brazos).

ROCKY BRANCH.—Gregg County; small tributary to Sabine River about 3 miles west of Longview.

ROCKY BRANCH.—Hill County; a small intermittent stream flowing southerly into Hackberry Creek (tributary to Aquilla Creek and thus to Brazos River) in central part of county southwest of Hillsboro. Waco topographic map.

ROCKY CREEK.—Bastrop County; northwest of Cistern in southern part of county; small intermittent stream flowing into Peach Creek and thus to Guadalupe River. Flatonia topographic map.

ROCKY CREEK.—Burnet County; formed 4½ miles southwest of Oakalla in northeastern corner of county by union of North and South Rocky creeks; flows northeasterly 5½ miles into Lampasas River (tributary through Little River to the Brazos) one-half mile northeast of Oakalla. Georgetown topographic map.

ROCKY CREEK.—Bell County; rises near Bell-Williamson county line; flows northerly 5 miles into Lampasas River (tributary through Little River to the Brazos) southwest of Youngsport. Georgetown topographic map.

ROCKY CREEK.—Bosque County; a stream flowing easterly 10 miles into Brazos River west of Prairie Valley in eastern part of county. Waco topographic map.

ROCKY CREEK.—Cass County; rises about 4 miles west of Forest; flows northeasterly 5 miles into Sulphur River (tributary to Red River and thus to the Mississippi).

ROCKY CREEK.—Colorado County; small stream in western part of county; flows southerly 5 miles joining Colorado River 4 miles west of Columbus.

ROCKY CREEK.—Comanche County; a small intermittent stream; rises near Comanche-Hamilton County line south of Carleton; flows southerly 4 miles into Resley Creek (tributary to Leon River, thence through Little River to the Brazos). Hamilton topographic map.

ROCKY CREEK.—Fayette County; rises near Rutersville; joins Colorado River in the eastern part of the county 4 miles east of LaGrange; length, 9 miles.

ROCKY CREEK.—Fayette County; tributary through Cummins Creek to Colorado River in the northeastern part of the county; flows one mile to the east of Roundtop; length, 8 miles.

ROCKY CREEK.—Fayette County; an intermittent stream rising two miles northeast of Flatonia, and flowing southeasterly to its junction with Mulberry Creek (thence to Navidad and Lavaca rivers and Gulf of Mexico) near the southern county line. Flatonia topographic map.

ROCKY CREEK.—Garza and Scurry counties; rises in northwestern corner of Scurry County; flows northerly 8 miles into Double Mountain Fork of Brazos River (which discharges into Brazos River).

ROCKY CREEK.—Gonzales County; southeast of Gonzales in the eastern part of the county; small intermittent stream flowing into Peach Creek (tributary to Guadalupe River).

ROCKY CREEK.—Grimes County; small intermittent stream flowing into Beasom Creek (tributary to Brazos River) east of Courtney in southern part of county. Navasota topographic map.

ROCKY CREEK.—Irion County; rises in the northern part of the county; flows southeastward about 17 miles into Middle Concho River (tributary to South Concho, and thus through Concho River to the Colorado) 1 mile south of Arden in the northeastern part of the county. Sherwood topographic map.

ROCKY CREEK.—Kaufman County; small stream flowing into Ferris Fork of Cedar Creek (tributary to Cedar Creek and Trinity River) in eastern part of county.

ROCKY CREEK.—Lavaca County; rises 4 miles west of Shiner near Lavaca-Gonzales county line; flows southeasterly 23 miles into Lavaca River (thus to Gulf of Mexico through Matagorda Bay) 7 miles south of Hallettsville.

ROCKY CREEK.—Llano County; an intermittent stream 3 miles in length flowing into Llano River (thence to Colorado River) northwest of Packsaddle in the southeastern part of the county. Llano topographic map.

ROCKY CREEK.—Miller County, Ark., and Bowie County, Tex., rises in Miller County, Ark., about 3½ miles southeast of Texarkana; flows southwesterly 3 miles to its intersection of the Texas-Arkansas state line about 3½ miles south of Texarkana, thence 1 mile through Bowie County, Tex., into Hurricane Creek (tributary to Sulphur River and thus through Red River to the Mississippi). Texarkana topographic map.

ROCKY CREEK.—Palo Pinto County; a stream flowing southeasterly 8 miles into Palo Pinto Creek (tributary to Brazos River) near Mingus in southwestern part of county. Palo Pinto topographic map.

ROCKY CREEK.—Palo Pinto County; a stream 7 miles long flowing southerly into Brazos River, 4 miles southeast of Brazos, in southeastern part of county. Palo Pinto topographic map.

ROCKY CREEK.—Wilbarger County; rises about 3 miles west of Harrold in eastern part of county; flows southerly 7 miles into Beaver Creek, thence to Wichita River, and thus through Red River to the Mississippi.

ROCKY CREEK.—Schleicher and Menard counties; a stream 15 miles long in the western part of Menard County; empties into San Saba River (tributary to the Colorado) 9 miles northeast of Fort McKavett. Fort McKavett topographic map.

ROCKY CREEK.—Washington County; rises 3 miles southwest of Independence in northern part of county; flows southeasterly 12 miles into Brazos River. Gay Hill topographic map.

ROCKY FORK OF NAVIDAD RIVER.—Lavaca County; rises near Novohrall in northwestern part of county; flows southeasterly 15 miles into Navidad River (tributary to Lavaca River, thence to Gulf of Mexico through Matagorda Bay) in northeastern part of county.

RODAIR BAYOU.—Jefferson County; small tidal stream rising about 1 mile southwest of Delphine; and flowing southwesterly 3 miles into Taylors Bayou (and thus through Sabine Lake to Gulf of Mexico) about one-half mile below mouth of Hillebrant Bayou.

RODGERS CREEK.—Wood and Upshur counties; rises in southeastern part of Wood County; flows southeasterly 6 miles into Sabine River in southwestern part of Upshur County.

ROGERS CREEK.—Harrison and Panola counties; rises in southern part of Harrison County; flows southerly 4 miles to its junction with Tuttle Creek in northwestern part of Panola County, where it forms Jackson Creek (tributary to Sabine River).

ROGERS OR SIXMILE CREEK.—Leon and Madison counties; rises in southeastern part of Leon County; flows easterly 9 miles, forming a loop in the northeastern corner of Madison County; joins Trinity River in Leon County about a mile southwest of Commerce.

ROGERS GULLY.—Harris County; rises 1 mile north of Harmaston; flows easterly 2 miles into San Jacinto River (tributary to Gulf of Mexico); intermittent. Harmaston topographic map.

ROLLING FORK.—Harris County; rises in northwestern part of county; 3½ miles east of Satsuma; flows southerly 2 miles into Whiteoak Bayou, thence to Buffalo Bayou and Gulf of Mexico; intermittent. Satsuma topographic map.

ROSALIA CREEK.—Duval County; small intermittent stream in southwestern part of county; flows eastward 8 miles to its junction with Parilla Creek (tributary to Gulf of Mexico through Poquita Creek and Baffins Bay).

ROSALES OR CHACON CREEK.—Frio and Medina counties; rises in the eastern part of Medina County; flows southerly 18 miles through Medina County, then 17 miles through Frio County into San Miguel Creek (tributary to the Nueces through Frio River); length, 36 miles.

ROSILLO CREEK.—Bexar County; rises north of Kerby in the eastern part of the county; flows southerly 16 miles into Salado Creek (tributary to San Antonio River and thus to the Guadalupe) 2½ miles east of Espada Mission. San Antonio topographic map.

ROSITA CREEK.—Jim Wells County; small tributary to Agua Dulce Creek (thence to Gulf of Mexico through Santa Petronilla Creek and Baffins Bay) in northeastern part of the county; flows northeasterly.

ROSS OR WEAVER CREEK.—Bowie County; rises about 5 miles southeast of De Kalb; flows southerly 8 miles into Bassett Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 2½ miles northwest of Bassett in western part of county.

ROSS CREEK.—Sterling and Mitchell counties; rises in the northeastern part of Sterling County; flows northeasterly 16 miles into Colorado River in the southern part of Mitchell County.

ROUGH CREEK.—Bosque and Somervell counties; rises in southwestern corner of Somervell County; flows southeasterly into East Bosque River (tributary to Bosque River and thus to the Brazos) 3 miles west of Walnut in the western part of Bosque County. Granbury topographic map.

ROUGH CREEK.—Coleman County; rises near Novice in the northwestern part of county; flows 11 miles to its junction with Jim Ned Creek, and thus through Pecan Bayou to the Colorado. Ballinger and Abilene topographic maps.

ROUGH CREEK.—Coke County; a short stream flowing southwesterly into Colorado River about 8 miles northwest of Robert Lee.

ROUGH CREEK.—Erath County; northerly flowing stream 3 miles long joining North Paluxy Creek (tributary to Paluxy Creek and thus to Brazos River) 3½ miles southwest of Morgans Mill in northern part of county. Stephenville topographic map.

ROUGH OR SWEETWATER CREEK.—Fisher and Scurry counties; rises near Dermott in northern part of Scurry County; flows northeasterly 22 miles into Double Mountain Fork of Brazos River tributary to the Brazos) near Adair in northwest corner of Fisher County.

ROUGH CREEK.—Mills County; small stream northwest of Regency in the southwestern part of the county; flows 5 miles into Colorado River. Brownwood and San Saba topographic maps.

ROUGH CREEK.—San Saba County; small stream northwest of Bend in the southeastern part of the county; tributary to Colorado River; length, 8 miles. San Saba topographic map.

ROUGH CREEK.—Somervell County; rises 2 miles northwest of Chalk Mountain; flows northerly 7 miles into Paluxy Creek (tributary to Brazos River) 3 miles southeast of Paluxy in western part of county. Granbury topographic map.

ROUGH HOLLOW.—Uvalde County; small intermittent tributary to West Nueces River west of Round Mountain; 4½ miles long. Brackett topographic map.

ROUGH HOLLOW.—Kinney County; a small intermittent tributary to West Nueces River (thence to Nueces River) rising at Turkey Mountain and flowing southeasterly through the northeastern part of the county; length, 7 miles. Brackett topographic map.

ROUGH RUN.—Brewster County; rises on eastern slope of Christmas Mountains; flows southwesterly 15 miles; joins Terlingua Creek (tributary to Rio Grande) 10 miles east of Terlingua. Terlingua topographic map.

ROUND HOLE BRANCH.—Erath County; rises 2 miles south of Selden in southern part of county; flows southerly 4 miles into Bosque River (tributary to the Brazos) near Clairette. Stephenville topographic map.

ROUND LAKE.—Bowie County; about 5 miles southeast of Maud in southern part of county; formed by an old channel of Sulphur River (tributary to Red River, which discharges into the Mississippi). New Boston topographic map.

ROUND LAKE.—Fort Bend County; 8 miles northeast of Richmond in northern part of county; outlet, Oyster Bay, which discharges into Brazos River; small.

ROUND-UP CREEK.—Collingsworth County; a stream 3½ miles long flowing southerly through eastern part of county into Salt Fork of Red River, thence to Prairie Dog Town of the Red, and thus through Red River to the Mississippi.

ROWLETT CREEK.—Collin, Dallas, and Rockwall counties; rises about 4 miles west of Allen in Collin County; flows southeasterly 26 miles into East Fork of Trinity River (tributary to Trinity River) in the southwestern part of Rockwall County a short distance above Barnes Bridge. Dallas and Barnes Bridge topographic maps.

RUCKER CREEK.—Hood County; rises near Parker-Hood county line; flows southerly 11 miles into Brazos River at Granbury in northeastern part of county. Weatherford and Granbury topographic maps.

RUNNING BRUSHY CREEK.—Williamson County; rises in southeastern part of county 1½ miles west of Brugerhoff; flows easterly 12 miles into Brushy Creek, tributary to San Gabriel River. Georgetown topographic map.

RUMMEL CREEK.—Harris County; rises 1½ miles northwest of Hillendahl; flows southwesterly 3½ miles into Buffalo Bayou (tributary to Sabine, Trinity, and Galveston bays, and thus to Gulf of Mexico); intermittent. Hillendahl topographic map.

RUNEY CANYON.—Jeff Davis County; a stream 6 miles in length connecting with Horse Thief Canyon (tributary to Limpia Creek, and thus through Paisano Creek and Pecos River to Rio Grande) in eastern part of county. Fort Davis topographic map.

RUNNING CREEK.—Hopkins and Wood counties; rises in southern part of Hopkins County; flows southerly 14 miles into Caney Creek in northwestern part of Wood County.

RUNNING FORK.—Shelby County; headwater stream of Patroon Bayou (tributary to Sabine River) southeast of Neuville in southern part of county.

RUSH CREEK.—Armstrong County; in northwestern part of county; an interrupted intermittent water course that probably, during extremely heavy precipitation, flows southwesterly about 9 miles into Dry Creek (tributary to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi River).

RUSH CREEK.—Navarro County; rises near Powell in eastern part of county; flows southeasterly 16 miles into Trinity River.

RUSH CREEK.—Rockwall County; an intermittent stream flowing into East Fork of Trinity River (tributary to the Trinity) southwest of Heath in the southwestern part of the county. Barnes Bridge topographic map.

RUSH CREEK.—Sabine County; flows southwesterly 6 miles into Devils Ford Creek (then to Bear Creek, Ayish Bayou, Angelina, and Neches rivers) in southwestern part of county.

RUSH CREEK.—Tarrant County; rises about 3½ miles southeast of Kennedale; flows northerly 11 miles into Village Creek (tributary to West Fork of Trinity River, and thus to the Trinity) 4 miles west of the town of Arlington. Fort Worth topographic map.

RUSH CREEK.—Wichita County; a small stream flowing into Wichita River (tributary to Red River and thus to the Mississippi) in the southwestern part of the county.

RUSH LAKE.—Fort Bend County; in northern part of county 6½ miles northeast of Richmond in Oyster Bayou drainage; outlet, Oyster Bay and Brazos River; small.

RUSKS BROOK.—Nacogdoches County; small stream flowing into Bayou Bonito (tributary to Bayou La Nana, and thence to Angelina and Neches rivers) in the town of Nacogdoches.

RUSTLERS CREEK.—Dickens and Motley counties; rises in northwestern corner of Dickens County; flows northeasterly 5 miles into Wolf Creek (tributary to Olive Fork of South Pease River and thus through South Pease, Middle Pease, and Pease rivers to Red River, which discharges into the Mississippi) about a mile north of the southern boundary line in southwestern part of Motley County.

RUSSELL CREEK.—Palo Pinto, Stephens, and Eastland counties; rises 5 miles east of Merriman in northern part of Eastland County; flows northeasterly 10 miles into North Palo Pinto Creek (which discharges into Brazos River through Palo Pinto Creek) 4 miles west of Strawn in southwestern part of Palo Pinto County. Eastland and Breckenridge topographic maps.

RUSSELL CREEK.—Hopkins County; small stream flowing into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi) about 4 miles northwest of Sulphur Springs in central part of county.

Russell Creek.—Tyler and Polk counties; rises about 3 miles east of Hortense in Polk County; flows northeasterly 17 miles into Neches River in Tyler County about 7 miles west of Rockland.

Russell Fork of San Gabriel River.—Burnet County; rises 5 miles north of Burnet in central part of county; flows easterly 17 miles into North Fork of San Gabriel River (tributary to San Gabriel River and thus through Little River to the Brazos) a mile southeast of Joppa. Burnet topographic map.

Sabanna River.—Comanche, Eastland and Callahan counties; rises near the village of Atwell near to Eastland and Callahan county line; flows southeasterly 50 miles into Leon River (tributary to Little River and thus to the Brazos) 6 miles south of Deleon in northern part of Comanche County. Eastland topographic map.

Sabina Creek.—Kendall County; near Welfare in central part of county; small tributary to Guadalupe River.

Sabinal River.—Bandera and Uvalde counties; rises near Vanderpool in the western part of Bandera County; flows southward and southeastward 18 miles through Bandera County, then 40 miles through Uvalde County into Frio River (tributary to the Nueces) in southeast corner of Uvalde County. Uvalde topographic map.

Sabinas Creek.—Kendall County; east of Comfort; tributary to Guadalupe River in western part of county.

Sabine River.—Rises about 3 miles northeast of Farmersville in Collin County in the northeastern part of the State; flows southeasterly 180 miles to the southeastern corner of Panola County, then takes a southerly course, forming the boundary between Texas and Louisiana for 180 miles; empties into Sabine Lake (an expansion of Sabine River in Orange County 13 miles below Orange, and thus through Sabine Pass to the Gulf of Mexico. Gaging stations at Longview, Tex., (1904–1906), Logansport, La., (1903–1906).

The river is navigable for small boats for some distance above its mouth, and commercially is of great value.

As the Sabine has its sources and watershed in a region of abundant rainfall, as well as a forest cover which conserves the run-off, it is fed by many strong flowing tributaries, many of which are utilized for small water-power plants. Rice is irrigated in the lower portion of the drainage. Area of drainage basin in Texas, 7,360 square miles. See Second Report of Texas Board of Water Engineers for list of certified filings for appropriation of water.

Sabine River, Lake Fork of.—Hopkins, Rains, and Wood counties; rises about 1 mile north of Daisy, in southwestern part of Hopkins County; flows southeasterly 44 miles into Sabine River about 1½ miles southwest of Crow, in southern part of Wood County.

Sabinillo Creek.—Sabine County; rises in northwestern part; flows southeasterly 6 miles into Palo Gaucho Bayou (tributary to Sabine River).

Sabine Lake.—Orange and Jefferson counties; heads 13 miles southwest of Orange; an expansion of Sabine River at its mouth; about 19 miles long and 6 miles wide; approximate area, 115 square miles; outlet through Sabine Pass (tidal channel about 8 miles long) to Gulf of Mexico; tidal. The Texas-Louisiana boundary line follows the center of Sabine Lake.

Saddlers Creek.—Donley County; rises about 2 miles southeast of Evans, in the northern part of the county; flows southerly 12 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi) 8 miles northwest of Clarendon.

SADDLE CREEK.—McCulloch County; in the northwestern part of the county; flows 7 miles to its junction with Salt Creek (tributary to the Colorado). Eden topographic map.

SAGE DRAW.—Dickens County; small stream flowing southward 7 miles into Duck Creek (tributary through Salt Fork of Brazos River to the Brazos) south of Gilpin, near Dickens-Kent county line.

ST. CLAIR CREEK.—Roberts County; rises 6 miles northwest of Miami; flows northerly 15 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 22 miles northwest of Miami, in northeastern part of county.

SALADO CREEK.—Bexar County; rises near Van Raub, in the northern part of the county; flows southerly 38 miles into San Antonio River (tributary to the Guadalupe) 3 miles south of Espada Mission. San Antonio topographic map.

SALADO CREEK, NORTH FORK.—Bell and Williamson counties; small stream flowing northeasterly into Salado Creek (tributary to Lampasas River and thus through Little River to the Brazos) south of Youngsport; length, 7 miles. Georgetown topographic map.

SALADO CREEK.—Williamson and Bell counties; rises 4 miles northwest of Florence, in northern part of Williamson County; flows northeasterly 35 miles into Lampasas River (tributary through Little River to the Brazos) 1 mile above mouth of Lampasas River. Georgetown and Taylor topographic maps.

SALADO CREEK.—Webb and Lasalle counties; rises in the northeastern part of Webb County; flows northeasterly 15 miles through Webb County, then 1 mile through Lasalle County into Nueces River, in southeastern corner of Lasalle County.

SALAVILLA CREEK.—Bexar County; rises southeast of Converse, in the eastern part of the county; empties into Martinez Creek (tributary to Rio Cibolo, thence through San Antonio River to the Guadalupe).

SALES BRANCH.—Tom Green County; an intermittent stream 5 miles long southwest of the town of Miles, in the northeastern part of the county; flows into Concho River and thus to the Colorado. Hayrick topographic map.

SALINAS CREEK.—Mason County; a stream 12 miles long flowing through the western part of the county to its junction with Llano River (tributary to the Colorado) south of Indianapolis. Mason topographic map.

SALINAS CREEK.—Refugio and Aransas counties; rises in the eastern part of Refugio County; flows southeasterly 2 miles through Refugio County, then 3 miles through Aransas County into St. Charles Bay, and thus to Aransas Bay and Gulf of Mexico.

SALINE OR CARTERS CREEK.—Brazos County; rises near Bryan, in central part of county; flows southeasterly 16 miles into Navasota River (tributary to Brazos River).

SALINE CREEK.—King County; a small stream flowing 5 miles west of Guthrie into South Wichita River, thence to Wichita River, and thus through the Red to the Mississippi.

SALINE FORK OF CROTON CREEK.—King County; considered continuation of Croton Creek; see also Croton Creek.

SALLIE KEATON SLOUGH.—Cass County; about 5 miles northeast of Douglasville; formed by an old channel of Sulphur River; during overflow connects Shoal Creek with Sulphur River (tributary to Red River, which discharges into the Mississippi); intermittent. Linden and New Boston topographic maps.

SALSAMORA CREEK.—Bexar County; rises north of the city of San Antonio; flows southeasterly 12 miles into San Pedro Creek (tributary through San Antonio River to the Guadalupe), in the southwestern part of San Antonio. San Antonio topographic map.

SALT BAYOU.—Jefferson County; rises in Star Lake about midway between Sabine Pass and west county line; flows northwesterly parallel to the Gulf shore, passes through lakes Kieth, Salt, Knight, and Fence, as well as a number of shallow lakes, then takes a northerly course, discharging into Taylors Bayou, and thus through Sabine Lake to the Gulf of Mexico, near West Port Arthur.

SALT BRANCH.—Erath County; an intermittent stream south of Dublin in southern part of county; flows southerly 4 miles into Resley Creek (tributary to Leon River and thus through Little River to the Brazos). Stephenville and Hamilton topographic maps.

SALT BRANCH.—Fayette County; south of Muldoon in western part of the county; a small intermittent stream about 2 miles long flowing into Pinoak Creek (tributary through Buckner Creek to Colorado River). Flatonia topographic map.

SALT BRANCH.—Karnes County; near Runge, in the eastern part of the county; flows through Ecleto Creek to San Antonio River and thus to the Guadalupe.

SALT BRANCH.—San Saba County; rises near Taylorville in the southeastern part of the county; flows northeasterly 7 miles into Cherokee Creek (tributary to Colorado River) 3½ miles northeast of the town of Cherokee. Llano and San Saba topographic maps.

SALT BRANCH OF SALT CREEK.—Concho and McCulloch counties; a small stream flowing through the northwestern part of McCulloch and northeastern part of Concho County into Salt Creek and thus to the Colorado; length, 11 miles. Eden topographic map.

SALT CREEK.—Armstrong County; rises in southwestern part of county; flows southwesterly 6 miles into Prairie Dog Town Fork of Red River (tributary to Red River, and thus to the Mississippi).

SALT CREEK.—Brown County; rises northeast of the town of Brownwood in the eastern part of the county; flows into Pecan Bayou (tributary to Colorado River); length, 11 miles. Brownwood topographic map.

SALT CREEK.—Collingsworth and Childress counties; rises in southwestern part of Collingsworth County; flows southeasterly 23 miles into Prairie Dog Town Fork of Red River (tributary to Red River, which discharges into the Mississippi) in northern part of Childress County.

SALT CREEK.—Guadalupe County; small intermittent stream flowing into Guadalupe River about 10 miles southeast of Seguin. San Marcos topographic map.

SALT CREEK.—Gillespie and Mason counties; a stream flowing through the south central part of Mason County and northwestern part of Gillespie County into James River (tributary to Llano River and thus to the Colorado); length, 18 miles. Kerrville and Mason topographic maps.

SALT CREEK.—Kent County; a stream flowing northeasterly 9 miles into Salt Fork of Brazos River (tributary to the Brazos) 5 miles northwest of Clairemont in western part of county.

117992°—19—WSP 448——14

SALT CREEK.—McCulloch County; rises 16 miles northwest of Brady in the western part of the county; flows northward 18 miles through Salt Gap in in Brady Mountains into Colorado River 6 miles west of Waldrip in the northwestern part of the county. Eden topographic map.

SALT CREEK.—Montague County; rises at Montague in central part of county; flows northwesterly 18 miles into Red River (tributary to the Mississippi) about 1 mile northeast of Red River Station Crossing on northern county line. Montague topographic map.

SALT CREEK.—Motley County; rises in western part of county; flows northeastward 4 miles into Middle Pease River (tributary to Pease River and thus through Red River to the Mississippi) about 4 miles northwest of Matador.

SALT CREEK.—Motley County; rises in the southeastern part of county; flows northeasterly 10 miles into South Pease River (tributary through Middle Pease to Pease River and thus through Red River to the Mississippi) in the eastern part of county about one-half mile west of the county line.

SALT CREEK.—Stonewall and Kent counties; rises near Stonewall-Kent county line; flows northeasterly 8 miles into Croton Creek (tributary to the Brazos).

SALT CREEK.—Lampasas County; small stream flowing through the southwestern part of the county into Colorado River; length, 11 miles. Lampasas and San Saba topographic maps.

SALT CREEK.—Young County; rises near Olney in northern part of county; flows southeasterly 28 miles into Brazos River 8 miles south of Graham.

SALT FLAT CREEK.—Brazos County; rises in southeastern part of county; flows easterly 2½ miles into Navasota River (tributary to Brazos River).

SALT FORK.—Gonzales County; rises in the southwestern part of the county; flows southeasterly 17 miles into Fivemile Creek (tributary through Sandies Creek to Guadalupe River) near Pilgrim.

SALT FORK OF BRAZOS RIVER.—Stonewall, Kent, Garza, and Crosby counties; one of the principal tributaries of Brazos River; rises 10 miles south of Emma in southeastern part of Crosby County; flows southeasterly 175 miles to its confluence with Double Mountain Fork of Brazos River to form Brazos River in northeastern part of Stonewall County. (See Brazos River.)

SALT FORK OF RED RIVER.—Carson, Armstrong, Donley, and Collingsworth counties, Tex., rises near Conway in southern part of Carson County; flows southeasterly 90 miles to the Texas-Oklahoma State line, east of Wellington in southeastern part of Collingsworth County, thence southeasterly 65 miles through Oklahoma into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) about 12 miles northwest of Doans in northern part of Wilbarger County, Tex.

SALTGRASS DRAW.—Brewster County; an intermittent stream 6 miles long rising 5 miles north of Terlingua and flowing into Terlingua Creek (tributary to Rio Grande) 6 miles northwest of Terlingua in southern part of county. Terlingua topographic map.

SALT HOLLOW.—Callahan County; small intermittent tributary flowing into Clear Branch (tributary to Pecan Bayou).

SALT PRONG OF HUBBARD CREEK.—Shackelford County; rises 10 miles southwest of Albany; flows northeasterly 20 miles into Hubbard Creek (tributary through Gonzales Creek to Clear Fork of Brazos River and thus to the Brazos) 9 miles east of Albany in eastern part of county. Albany topographic map.

Salt Prong Hubbard Creek, North Fork.—Shackelford County; rises 8 miles west of Albany; flows easterly 12 miles into Salt Prong of Hubbard Creek (tributary to Hubbard Creek and thus through Gonzales Creek and Clear Fork of Brazos River to the Brazos) 3 miles southeast of Albany. Albany topographic map.

San Ambrosio Creek.—Dimmit, Webb, and Maverick counties; rises near the line of Dimmit and Maverick counties; flows southwesterly about 20 miles through San Ambrosio Pass in southeastern part of Maverick County; thence southerly approximately 24 miles into Rio Grande in the extreme western corner of Webb County.

San Andres Creek.—Jim Wells County; small intermittent stream flowing southeasterly to its junction with Santa Gertrudis Creek (thence to Baffins Bay and Gulf of Mexico) near the center of the eastern county line.

San Antonio Creek.—Jim Hogg and Brooks counties; rises in the northeastern part of Jim Hogg County; flows eastward 10 miles through Jim Hogg County, then 18 miles through Brooks County into Laguna de Loma Blanca (thence to Gulf of Mexico through Palo Blanco Creek and Laguna Madre).

San Antonio Canyon.—Presidio County; rises in Chinati Mountains in the western part of the county, 12 miles northwest of Shafter; flows southwesterly into Rio Grande 8 miles northwest of Borracho; length, 11 miles; intermittent. Ruidoso and Shafter topographic maps.

San Antonio River.—Formed in Breckenridge Park, city of San Antonio, near the center of Bexar County by several large springs; flows southeasterly 25 miles through Bexar County, 39 miles through Wilson, 42 miles through Karnes, 44 miles through Goliad, then 8 miles along the boundary between Goliad and Victoria counties, thence 22 miles between Victoria and Refugio counties to its junction with Guadalupe River (thence to San Antonio Bay and Gulf of Mexico) about 12 miles above its mouth. The river, in its upper reaches, is extensively used for irrigation, power, and municipal purposes. Gaging stations at San Antonio and Calaveras. Area of drainage basin, 4,460 square miles; principal tributaries, Medina River and Cibolo Creek. San Antonio topographic map.

See Second Report of Texas Board of Water Engineers for list of certified filings for appropriation of water.

San Bernard River.—Rises near Austin-Colorado county line near New Ulm in the southwestern part of Austin County; flows southeasterly 105 miles. Along its course, the river forms the boundary between Austin and Colorado counties for 31 miles, Austin and Wharton for 8 miles, Fort Bend and Wharton for 28 miles; thence along the western part of Brazoria County 38 miles into Cedar Lake, an arm of the Gulf of Mexico.

San Cristobal Creek.—Karnes, Atascosa, and Live Oak counties; rises in the southwestern part of Karnes County; flows southwesterly 4 miles through Karnes County, then 17 miles through Live Oak County into Atascosa River (tributary to the Nueces through Frio River) at Fant City.

San Diego Creek.—Duval and Jim Wells counties; rises in northeastern part of Duval County; flows southeastward to its junction with Chiltipin Creek (thence to Gulf of Mexico through Pinias Creek, Santa Petronilla Creek, and Baffins Bay) in the northeastern part of Jim Wells County.

San Felipe Creek.—Val Verde County; rises about 8 miles northeast of Del Rio; flows southwesterly into Rio Grande 3 miles south of Del Rio.

San Fernando Creek.—Mason, Llano, and San Saba counties; rises northwest of Field Creek near the corner common to Mason, Llano, and San Saba counties; flows southeasterly 30 miles into Llano River (tributary to the Colorado) 5 miles west of Llano. Llano topographic map.

San Fernando Creek.—McMullen County; small intermittent stream; rises in the western part of the county; flows southeastward 16 miles to its junction with Nueces River. 6 miles southeast of Brushy Hills.

San Fernando Creek.—Jim Wells, Nueces, and Kleberg counties; rises in the eastern part of Jim Wells County; flows southeastward 2 miles through Jim Wells County, 2 miles through the southwestern part of Nueces County, along the boundary between Nueces and Kleberg counties for 7 miles, then 8 miles through the west central part of Kleberg County into Baffins Bay, an arm of Gulf of Mexico.

San Francisco Creek.—Brewster and Terrell counties; rises in northern part of Brewster County a few miles north of Haymond; flows southeastearly about 35 miles into Rio Grande near the point where Brewster-Terrell county line intersects Rio Grande. Hood Spring, Dove Mountain, Bullis Gap, and Indian Wells topographic maps.

San Gabriel River.—Milam and Williamson counties; formed at Georgetown by the union of the North and South Forks of San Gabriel River; flows northeasterly about 30 miles into Little River (tributary to Brazos River) 6 miles southwest of Cameron and west of Minerva. Georgetown and Taylor topographic maps.

San Gabriel River, North Fork of.—Burnet and Williamson counties; rises southwest of Lake Victor in northern part of Burnet County; flows southeasterly about 45 miles to Georgetown, where it unites with the South Fork to form San Gabriel River (tributary to Little River and thus to the Brazos) in western part of Williamson County. Burnet and Georgetown topographic maps.

San Gabriel River, South Fork.—Williamson and Burnet counties; rises 3 miles east of the town of Burnet in central part of Burnet County, at an approximate altitude of 1,500 feet above sea level; flows southeasterly 35 miles to its confluence with North Fork of San Gabriel River to form San Gabriel River (tributary to Little River and thus to the Brazos) at Georgetown in western part of Williamson County. Burnet and Georgetown topographic maps.

San Isabel Creek.—Webb County; rises about 35 miles northwest of the town of Laredo in northwestern part of county; flows southerly 35 miles into Rio Grande 15 miles northwest of Laredo.

San Jacinto River.—Harris County; formed in the northeastern corner of Harris County by the junction of the east and west branches (which rise in the southern part of Walker County and flow southeasterly through San Jacinto, Montgomery, and Liberty counties), takes a southeasterly course 39 miles through Harris County into San Jacinto Bay near Lynchburg, thence through Trinity Bay into Galveston Bay and Gulf of Mexico.

San Juanita Creek.—Webb and Zapata counties; an intermittent stream rising in the southern part of Webb County and flowing southwesterly 15 miles into Rio Grande in northwestern corner of Zapata County.

San Julian Creek.—Bandera County; small intermittent stream in eastern part of county; joins Medina River (tributary through San Antonio River to the Guadalupe) 5 miles east of Bandera.

San Lorenzo Creek.—Dimmit and Webb counties; rises in the southwestern part of Dimmit County; flows southerly 30 miles into Rio Grande in the northwestern corner of Webb County; intermittent.

San Marcos River.—Hays, Caldwell, Guadalupe, and Gonzales counties; formed near the northern limits of the city of San Marcos, Hays County, by several large springs, although its watershed extends about 10 miles northeast of the springs; flows southeasterly 4 miles through Hays County, then 2 miles forming the boundary between Hays and Caldwell counties, 32 miles along the boundary of Guadalupe and Caldwell counties, 4 miles between Gonzales and Caldwell counties ,thence 17 miles through Gonzales County to its confluence with Guadalupe River about 1½ miles southwest of Gonzales. Area of drainage basin, 1,380 square miles. Gaging stations at San Marcos and Ottine.

The stream is of economic importance; its waters are used for municipal purposes, power, and irrigation at various points. San Marcos and Flatonia topographic maps. (See Guadalupe River.)

San Miguel Creek.—Frio, Atascosa, and McMullen counties; formed in the east central part of Frio County-by junction of Black Creek and Rosales or Chacon Creek; flows southeastward 14 miles through Frio County, 11 miles through Atascosa County, and 21 miles through McMullen County into Frio River (tributary to Nueces River) about 12 miles east of Tilden.

San Patricio Creek.—McMullen County; small tributary to San Miguel Creek (thence to Nueces River through Frio River) rising in the northern part of the county; length, 8 miles.

San Pedro Creek.—Dimmit and Maverick counties; an intermittent stream about 2 miles long rising in the southwestern part of Dimmit County and flowing westward to its junction with San Ambrosio Creek (tributary to Rio Grande) about 2 miles south of San Ambrosio Pass.

San Pedro Creek.—Houston County; a stream 18 miles long flowing easterly into Neches River in northern part of county.

San Pedro Creek.—Bexar County; formed in San Pedro Park, San Antonio, by springs; flows southerly 2 miles through an artificial channel in the city of San Antonio into San Antonio River (tributary to Guadalupe River) one-half mile west of Conception Mission; gaging station at its intersection with Commerce Street, San Antonio. San Antonio topographic map.

San Pedro Creek.—Webb County; rises in the western port of county; flows southwesterly about 3 miles into Rio Grande; intermittent.

San Roque Creek.—Dimmit County; small stream in southeastern part of county; flows northeasterly 35 miles to its junction with Nueces River near eastern county line.

Sanches Creek.—Parker County; rises 1 mile northeast of Lambert in central part of county; flows southerly 17 miles into Brazos River 3 miles south of Balch in southern part of county. Weatherford topographic map.

Sancito or Escondido Creek.—Duval, Jim Wells. and Kleberg counties; rises near Sweden in the center of Duval County; flows southeastward and eastward 15 miles through Duval County, 11 miles through the southern part of Jim Wells County, then 10 miles through Kleberg County into Santa Gertrudis Creek (thence to Gulf of Mexico through Baffins Bay) southeast of Ricardo.

Sanders Creek.—Shelby County; small stream flowing into Stone Bayou (tributary to Sabine River) northwest of Hamilton in southeastern part of county.

S[illegible] H[illegible] Creek.—Dickens and Motley counties; rises in northern part of Dickens County; flows [illegible] miles into South Pease River (tributary to Middle Pease and thus through Pease and Red rivers to the Mississippi) about [illegible] miles north of northern boundary of Motley County in southeastern part of county.

Sanders Creek.—Freestone, Limestone, and Leon counties; rises near the town of Freestone in southern part of Freestone County; flows southerly 20 miles into Navasota River (tributary to Brazos River) southwest of Evansville in western part of Leon County.

Sanders Creek.—Lamar County; rises [illegible] miles north of High in western part of county; flows northeasterly [illegible] miles into Red River (tributary to the Mississippi) 3 miles west of Arthur City.

Sanderson Canyon.—Terrell County; rises in southwestern part; flows southerly about 14 miles into Rio Grande; intermittent. Dryden Crossing topographic map.

Sanders Creek.—Leon, Limestone, and Freestone counties; rises near the village of Freestone in southern part of Freestone County; flows southwesterly 11 miles into Navasota River (tributary to the Brazos) in northwestern corner of Leon County.

Sandies Creek, Elm Fork of.—Wilson, Karnes, and Gonzales counties; rises in the northeastern part of Wilson County; flows northeasterly 4 miles through Wilson, 4 miles through Karnes, thence 12 miles through Gonzales County to its confluence with Sandies Creek, northwest of Sample, and thus to Guadalupe River.

Sandies Creek.—Lavaca County; rises 5 miles southeast of Hallettsville; flows southeasterly 12 miles into Navidad River (which discharges into Lavaca River, thence to Matagorda Bay and Gulf of Mexico) near Seclusion.

Sandies Creek, Clear Fork.—De Witt County; rises in western part of county; flows northeasterly 14 miles into Sandies Creek (tributary to the Guadalupe) east of Westhoff.

Sandies Creek, Castlemans Fork.—Gonzales County; small stream flowing south and west of Yorktown in southern part of county into Sandies Creek, and thus to Guadalupe River.

Sandies Creek.—Gonzales and DeWitt counties; Castlemans or Main Fork rises in the western part of Gonzales County; flows southeasterly 31 miles through Gonzales County, then 15 miles through De Witt County, entering Guadalupe River 2 miles northwest of Cuero.

Sand Creek.—Atascosa County; a small tributary to Sesteadero Creek (thence to Nueces River through Atascosa and Frio rivers), rising in northwestern part of county and flowing southerly 8 miles.

Sand Creek.—Brown County; near Thrifty in the western part of county; flows six miles into Jim Ned Creek (tributary to Pecan Bayou and thus to the Colorado). Coleman topographic map.

Sand Creek.—Collingsworth County; a stream flowing northeasterly through southeastern part of county into Salt Fork of Red River (tributary through Prairie Dog Town Fork of the Red to Red River and thus to the Mississippi); length, 8 miles.

Sand Creek.—Collingsworth and Childress counties; rises in the southeastern part of Collingsworth County; flows southeastward 12 miles to its intersection of Texas-Oklahoma boundary line at the eastern line of Childress County about 4 miles south of the northeastern corner of county; thence southeasterly 12 miles through Harmon County, Oklahoma, into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi).

SAND CREEK.—Crosby County; rises 4 miles southeast of Crosbyton; flows southeasterly 11 miles into Davidson Creek (tributary to White River and thus through Salt Fork of Brazos River to the Brazos) near Holt's store in southeast part of county.

SAND CREEK.—Garza County; rises 3 miles southeast of Post City; flows easterly 11 miles into North Fork of Double Mountain Fork of Brazos River (tributary through Double Mountain Fork of the Brazos to the Brazos).

SAND CREEK.—Grayson County; rises 5 miles northwest of Sherman in central part of county; flows southeasterly 5 miles into Postoak Creek (tributary to Choctaw Creek, thence to Red River, and thus to the Mississippi) in southern edge of Sherman city limits. Denison topographic map.

SAND CREEK.—Grimes County; an intermittent stream flowing to a point southeast of the town of Navasota where it enters Walker Creek and thus to Brazos River; length, 7 miles. Navasota topographic map.

SAND CREEK.—Mason and Llano counties; small intermittent stream 5 miles long flowing along the boundary of Mason and Llano counties north of Castell; empties into Elm Creek and thus through the Llano to Colorado River. Llano topographic map.

SAND CREEK.—Wheeler and Collingsworth counties; rises in southwestern part of Wheeler County; flows southerly 12 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi) in the western part of Collingsworth County.

SAND CREEK.—Zavalla County; small intermittent stream in northern part of county; flows southward 10 miles to its junction with Nueces River 5 miles south of La Pryor. Uvalde topographic map.

SAND SPRING CREEK.—Llano County; a small intermittent stream 4 miles in length flowing into Johnson Creek which connects with Llano River (tributary to the Colorado) southeast of Valley Springs in the northern part of the county. Llano topographic map.

SANDY CREEK.—Austin County; rises 6 miles east of New Ulm in central part of county; flows easterly 7 miles into Mill Creek (tributary to Brazos River) 3 miles southwest of Bellville.

SANDY CREEK.—Bastrop County; small stream 13 miles in length in the central part of the county; joins Walnut Creek (tributary to Colorado River) 2 miles southwest of Hills Prairie. Flatonia and Bastrop topographic map.

SANDY CREEK.—Brazos County; an easterly flowing stream 8 miles long joining Navasota River (tributary to Brazos River) opposite Madison-Grimes county line.

SANDY CREEK.—Colorado, Wharton, and Jackson counties; rises in the southwestern part of Colorado County; flows southeasterly and southerly 16 miles along the southwestern boundary of Colorado County, 12 miles through the western part of Wharton County, then 14 miles through Jackson County into Navidad River (thence to Lavaca River, Matagorda Bay and Gulf of Mexico) southwest of Ganado.

SANDY CREEK.—Cooke and Grayson counties; rises about 3 miles north of Callisburg in the eastern part of Cooke County; flows easterly 14 miles into Mineral Creek (tributary to Red River and thus to the Mississippi) about 3 miles north of Steedman in the northwestern part of Grayson County. Denison topographic map.

SANDY CREEK.—Fannin County; rises in northeastern part of county; flows northerly 5½ miles into Bois d'arc Creek (tributary to Red River and thus to the Mississippi).

Sandy Creek.—Fisher County; an intermittent stream rising 5 miles south of Roby; thence flows northeasterly to a point 4 miles east of Roby in central part of county, where it enters Clear Fork of Brazos River and thus to the Brazos [illegible] miles. Roby topographic map.

Sandy Creek.—[illegible] County; rises in southwestern part of county; flows [illegible] into Double Mountain Fork of Brazos River and thus to the Brazos.

Sandy Creek.—[illegible] County; small intermittent stream flowing into [illegible] Creek (tributary to Red River and thus to the Mississippi) near [illegible] in [illegible]western part of county. Denison topographic map.

Sandy Creek.—Jasper County; rises about 7 miles north of the town of Jasper; flows southerly 8 miles, then southwesterly 16 miles into Neches River.

Sandy or [illegible] Creek.—Lavaca County; rises in southeastern part of county; flows southerly into Navidad River (tributary to Lavaca River, [illegible] Bay and Gulf of Mexico) near Sedusion; length, 7 miles.

Sandy Creek.—Llano and Gillespie counties; rises 10 miles north of the town of Fredericksburg in northern part of Gillespie County; flows northward and eastward about 35 miles into Colorado River 6 miles south of Kingsland in the eastern part of Llano County. Llano and Burnet topographic maps.

Sandy Creek.—Lipscomb County; rises [illegible] miles southwest of Lipscomb; flows northeasterly into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 1 mile west of Lipscomb in central part of county; intermittent.

Sandy Creek.—Montgomery County; small tributary to Lake Creek (tributary to West San Jacinto River, San Jacinto River and thus to Gulf of Mexico) in the western part of Montgomery County; flows northeastward 5 miles.

Sandy Creek.—Milam County; a stream 12 miles long flowing into Little River (tributary to the Brazos) between Rockdale and Cameron in central part of county.

Sandy Creek.—Newton and Sabine counties; rises in the northwestern corner of Newton County; flows northeasterly 14 miles into Sixmile Creek (tributary to Sabine River) in the southeastern part of Sabine County.

Sandy Creek.—Robertson County; rises near Calvert; flows southerly 5 miles into Mud[illegible] Creek (tributary to Little Brazos River and thus to the Brazos) 4 miles north of Hearne.

Sandy Creek.—Sabine and Newton counties; rises in southern part of Sabine County; flows southwesterly 5 miles into Big Cow Creek (tributary to Sabine River).

Sandy Creek.—Sabine and San Augustine counties; rises in southwestern part of Sabine County; flows southwesterly 11 miles into Ayish Bayou (tributary to Angelina River and thus to the Neches) in the southeastern part of San Augustine County.

Sandy Creek.—Sabine County; small stream flowing into Devils Ford Creek (tributary through Bear Creek to Ayish Bayou, then to Angelina River, and thus to the Neches) in southwestern part of county.

Sandy Creek.—Stephens and Eastland counties; rises 7 miles southwest of Cisco; flows northerly 45 miles into Hubbard Creek (which discharges into Gonzales Creek and thus through Clear Fork of Brazos River to the Brazos) 6 miles northwest of Breckenridge in northwestern part of Stephens County. Albany, Eastland, and Breckenridge topographic maps.

Sandy Creek.—Stephens County; rises $2\frac{1}{2}$ miles northwest of Caddo in eastern part of county; flows northerly 9 miles into Big Cedar Creek, thence into Brazos River. Breckenridge topographic map.

SANDY CREEK.—Travis County; rises 3 miles south of Hopewell in the northwestern part of the county; flows southeastward 15 miles into Colorado River, 1 mile southeast of Valente. Georgetown and Austin topographic maps.

SANDY CREEK.—Washington County; rises 5 miles northwest of Brenham; flows easterly 7 miles into New Years Creek (tributary to Brazos River) 2½ miles north of Brenham in central part of county.

SANDY CREEK.—Wise County; small tributary to Big Sandy Creek (which discharges into Trinity River through the West Fork of the Trinity) northwest of Decatur in central part of county.

SANS CREEK.—La Salle County; tributary to Nueces River in the southeastern part of county; flows southward about 40 miles.

SAN SABA RIVER.—Schleicher, Menard, Mason, McCulloch, and San Saba counties; formed near Fort McKavett and the Schleicher-Menard county line by a number of large springs. The North and Middle Valley branches (intermittent) rise west of Fort McKavett in the southeastern part of Schleicher County; the main stream flows easterly 38 miles through Menard County, 7 miles through the northwestern corner of Mason County, 20 miles through the southeastern part of McCulloch County, then 35 miles through San Saba County into Colorado River 8½ miles northeast of San Saba in the eastern part of San Saba County. Area of drainage basin, 3,150 square miles. Gaging stations at Menard and near San Saba.

In the vicinity of Menard and San Saba lands are irrigated, but between these two points the use of water is greatly diminished. Water is stored in Brady Creek, principal tributary to San Saba River, by the city of Brady for municipal use, and a small amount of power is developed by use of the water at San Saba. At 12 miles below Menard, the river enters a portion of the drainage basin classed as rough but interspersed with small irrigable valleys. It traverses this character of topography for 50 miles until it reaches a point 17 miles above the town of San Saba, where it widens into a rich valley. Fort McKavett, Mason, Brady, and San Saba topographic maps.

See Second Report of Texas Board of Water Engineers for list of certified filings of appropriations for use of water.

SANTA ANNA BRANCH.—Coleman County; southwest of the town of Santa Anna in the central part of the county; empties into Home Creek and thus to the Colorado River; length, 9 miles. Coleman topographic map.

SANTA GERTRUDIS CREEK.—Duval, Jim Wells, and Kleberg counties; rises in the west central part of Duval County; flows southeastward 30 miles through Duval and Jim Wells counties, then 27 miles through Kleberg County into Baffins Bay, an arm of the Gulf of Mexico.

SANTA PETRONILLA CREEK.—Duval, Jim Wells, Nueces, and Kleberg counties; rises near Shaeffer in the northeastern part of Duval County; flows southeasterly 10 miles through Duval County, 20 miles through the north central part of Jim Wells County, 24 miles through the southwestern part of Nueces County, then 12 miles through the eastern part of Kleberg County, into Baffins Bay, an arm of the Gulf of Mexico.

SANTO TOMAS CREEK.—Webb County; an intermittent stream in southwestern part of county; flows southerly 8 miles into Rio Grande.

SANZ CREEK.—Bexar County; rises in the western part of the county; flows into the Medina River (tributary to San Antonio River and thus to the Guadalupe) 4 miles northeast of Castroville; intermittent.

SAUCILLO CREEK.—Webb County; an intermittent stream; rises in the western part of the county; flows southward 2 miles into Rio Grande.

SAUCITA CREEK.—Presidio County; an intermittent stream in northern part of county; flows easterly 16 miles into Long Draw, thence to Alamita Creek (tributary to Rio Grande) 1 mile west of Bogel. Marfa topographic map.

SAUS OR IMPERIALIST CREEK.—Kinney and Maverick counties; rises near Spofford in Kinney County; flows southerly 8 miles through Kinney County, then continues the same course 25 miles through Maverick County to its junction with Rio Grande, approximately 2 miles north of Eagle Pass; intermittent. Brackett topographic map.

SAUZ OLMOS CREEK.—Starr and Zapata counties; rises in the northeast corner of Zapata County; flows southerly 75 miles into Rio Grande 3 miles southeast of Rio Grande City in the southern part of Starr County.

SAWYER BRANCH.—Erath County; rises south of Dublin in southern part of county; flows southerly 3 miles into Resley Creek (tributary to the Leon and thus through Little River to the Brazos); intermittent. Stephenville topographic map.

SAWLOG CREEK.—Guadalupe County; rises near Capote School, in southeastern part of county; tributary to Guadalupe River; intermittent. San Marcos topographic map.

SAWMILL CANYON.—Brewster County; rises in western part of county, 2½ miles northwest of Sawmill Mountain; flows southeasterly 4½ miles into Terlingua Creek (tributary to Rio Grande); intermittent. Terlingua topographic map.

SCARBOROUGHS CREEK.—Lavaca County; rises in southwestern part of county; flows southeasterly 5 miles between Big Brushy and Clarks Creek into Clarks Creek (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico).

SCHEP CREEK.—Mason County; a stream flowing through central part of the county into the Llano (tributary to Colorado River); length, 10 miles. Mason topographic map.

SCHILLA BAYOU.—Harris County; a small tidal bayou in the southeastern part of the county; flows northeasterly about 1 mile into Ship Channel (Buffalo Bayou) near Penn City, thence to Galveston Bay and Gulf of Mexico.

SCHOOL CREEK.—Lampasas County; rises east of Lometa; flows easterly 16 miles into Lampasas River (tributary through Little River to the Brazos). Lampasas topographic map.

SCHOOL CREEK.—Young and Jack counties; rises in the northeastern part of Young County; flows northeasterly 10 miles into West Fork of Trinity River (tributary to Trinity River), in northwestern part of Jack County.

SCOOLER CREEK.—Rusk County; rises about 6 miles southwest of Henderson; flows southeasterly 9 miles into Big Shawnee Creek and thus through Angelina River to the Neches.

SCOTT BAYOU.—Cass and Marion counties; rises about 5 miles northwest of Lodi (Marion County), in southern part of Cass County; flows southerly 8 miles into Black Cypress Bayou (tributary to Caddo Lake through Big Cypress Bayou and thus through Red River to the Mississippi) about 3 miles north of Jefferson, in central part of Marion County.

SCOTT BRANCH.—Gillespie County; flows northeastward 7 miles into Pedernales River (tributary to Colorado River) 7 miles southwest of Harper, in the southwestern part of the county. Kerrville topographic map.

SCOTT CREEK.—Cooke County; rises about 4 miles southwest of Gainesville; flows southeasterly 10 miles into Elm Fork of Trinity River (tributary to Trinity River) about 4 miles west of Burns. Gainesville topographic map.

SCOTTS CREEK.—Marion County; rises near Cass-Marion county line 4 miles west of Lodi; flows southerly 7 miles into Black Cypress Bayou (tributary to Ferry and Caddo lakes through Big Cypress Bayou, thence through Red River to the Mississippi) 2½ miles north of Jefferson, in central part of county.

SCOTT CREEK.—Stephens and Young counties; a stream flowing northeasterly 3 miles into Brazos River 1 mile north of Young-Stephens county line.

SCRUGGAN BRANCH.—Tarrant County; small stream flowing into West Fork of Trinity River (tributary to the Trinity) about 5 miles west of Fort Worth. Fort Worth topographic map.

SCRUGGS CREEK.—Caldwell County; small stream in southeastern part of county; flows into Sandy Fork of Peach Creek, and thus through Peach Creek to Guadalupe River; intermittent. Flatonia topographic map.

SEALS CREEK.—Caldwell County; rises near McCutcheon School in the southern part of the county; flows southeasterly 9 miles into San Marcos River (tributary to the Guadalupe) 2 miles southwest of Luling. San Marcos topographic map.

SEALS GULLY.—Harris County; rises in northwestern part of county 2½ miles southeast of Willow Siding; flows southeasterly 5 miles into Cypress Creek; intermittent. Louetta and Spring topographic maps.

SECO CREEK.—Medina and Frio counties; rises in the northwestern corner of Medina County; flows southeastward 40 miles into Hondo Creek (tributary to Nueces River through the Frio) 5 miles southwest of Yancey.

SECOND ELM CREEK.—La Salle County; small intermittent stream in western part of county; flows southeasterly about 20 miles to its junction with Las Raices Creek (tributary to Nueces River).

SECOND OR MIDDLE YEGUA CREEK.—Lee and Williamson counties; rises in southeastern corner of Williamson County; flows southeasterly 30 miles to its confluence with First Yegua Creek to form Yegua Creek (tributary to Brazos River) about 5 miles southeast of Dime Box in southeastern part of Lee County. Bastrop topographic map.

SECOND CREEK.—Lipscomb County; rises 3 miles southwest of Kiowa; flows southerly 10 miles into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 6 miles northwest of Valley Park in western part of county.

SEMINOLE CANYON.—Terrell County; rises in southwestern part; flows easterly about 7 miles into Sanderson Canyon (tributary to Rio Grande); intermittent. Indian Wells and Dryden Crossing topographic maps.

SENECA BURRO CREEK.—Dallam County; an intermittent stream rising in southern part of Cimarron County, Okla., and flowing southerly to its junction with Rabbit Ear Creek (tributary to Coldwater Creek, and thus through Beaver, North Fork of Canadian, and Arkansas rivers to the Mississippi) in northern part of Dallam County, Tex.

SESTEADERO CREEK.—Atascosa County; rises in the northwestern part of the county; flows southeasterly 8 miles into Atascosa River (tributary to Nueces River through the Frio).

SENGER GULLY.—Harris County; rises in northwestern part of county 2½ miles southwest of Spring; flows southeasterly 3 miles into Cypress Creek; intermittent. Spring topographic map.

SETTLERS CREEK.—Childress County; a stream 7 miles long flowing southeasterly 7 miles through northeastern part of county into Spiller Creek (tributary through Prairie Dog Town Fork of Red River to Red River and thus to the Mississippi).

SHAFTERS LAKE.—Andrews County; west of Logsdon in northwestern part of county; outlet, North Concho River (tributary through Concho River to the Colorado); small.

SHAFTER CANYON.—Terrell County; rises in southwestern part near Loma Vista; flows southerly 6 miles into Rio Grande; intermittent. Dryden Crossing topographic map.

SHANNON CREEK.—Grayson County; rises 4 miles northeast of Sherman; flows easterly 6 miles into Choctaw Creek (tributary to Red River, which discharges into the Mississippi).

SHAWNEE CREEK.—Angelina County; rises in the central part of county about 5 miles southeast of Homer; flows southeasterly 17 miles into Neches River about 5 miles southwest of Dunkin.

SHAWNEE CREEK.—Grayson County; rises about 3 miles east of Pottsboro in northern part of county; flows intermittently northeasterly 6 miles into Red River (tributary to Mississippi River) about a mile west of Missouri, Kansas & Texas Railway bridge north of Denison. Denison topographic map.

SHAWNEE CREEK.—Rusk County; rises in central part of county 4 miles northeast of Henderson; flows southwesterly 28 miles into Angelina River (tributary to Neches River, thence through Sabine Lake to Gulf of Mexico).

SHAWNEE CREEK.—Red River County; rises about 6 miles southwest of Avery in southeastern part of county; flows southerly 13 miles into Sulphur River which discharges into the Mississippi through Red River.

SHAWS CREEK.—Mills County; a small stream 6 miles southeast of Big Valley in the southern part of county; flows 4 miles into Colorado River. San Saba topographic map.

SHEEP RANCH HOLLOW.—Eastland County; a stream flowing northeasterly 6 miles into Elm Creek (tributary to Sabanna River and thus through Leon and Little rivers to the Brazos) 7 miles south of Carbon in southern part of county. Eastland topographic map.

SHEPHERDS CREEK.—Madison County; rises in western part of county; flows southwesterly 10 miles into Navasota River (tributary to the Brazos) southwest of Zulch.

SHINOAK BRANCH.—Comanche and Eastland counties; rises near Gorman in southeastern part of Eastland County; flows southerly 5 miles into Sabanna River (tributary through Leon River to Little River and thus to the Brazos) 9 miles northwest of De Leon in northern part of Comanche County. Eastland topographic map.

SHIBLEY BRANCH.—Shackelford and Throckmorton counties; a southerly flowing stream joining Clear Fork of Brazos River (tributary to the Brazos) 3 miles east of Fort Griffin in northeastern part of Shackelford County; length, 5 miles. Albany topographic map.

SHOAL OR JACKSON CREEK.—Cass County; rises about 2 miles southeast of Douglasville; flows northeasterly 6½ miles into Sulphur River (tributary to Red River and thus to the Mississippi). Linden and New Boston topographic maps.

SHOAL CREEK.—Coryell County; an intermittent stream flowing northeasterly 6 miles into Leon River (tributary to Little River and thus to the Brazos) near Twin Mountains in central part of county. Gatesville topographic map.

SHOAL CREEK.—Travis County; rises 2 miles south of Duval in the central part of the county; flows southerly 9 miles into Colorado River in the western part of the City of Austin. Austin topographic map.

SHORT CANYON.—Jeff Davis County; a stream 8 miles long rising 7 miles northwest of Fort Davis in Davis Mountains and flowing northeasterly to its junction with Limpia Creek (tributary through Paisano Creek to Pecos River and thus to Rio Grande) 13 miles northeast of Fort Davis. Fort Davis topographic map.

SHORT CREEK.—Wichita County; rises 9 miles east of Electra in northern part of county; flows southerly into Lost Creek (tributary through North Fork of Buffalo Creek to Buffalo Creek, thence through Wichita River to Red River and thus to the Mississippi); intermittent. Barwise School topographic map.

SHORT CREEK.—Hunt County; rises about 2 miles north of Wolfe City in northern part of the county near northern boundary of county; flows southerly 4 miles into South Sulphur River (tributary to Sulphur River and thus to the Mississippi through Red River).

SHORES CREEK.—Childress and Cottle counties; rises about 9 miles southwest of the town of Childress in southwestern part of Childress County; flows southeasterly 13 miles into Pease River (tributary to Red River and thus to the Mississippi) in northern part of Cottle County.

SIBLEYS CREEK.—Throckmorton County; a stream flowing southwesterly 1½ miles into Clear Fork of Brazos River (tributary to Brazos River) north of Fort Griffin in southern part of county.

SIERRITA DE LA CRUZ CREEK.—Potter and Oldham counties; rises in southeastern part of Oldham County; flows northeasterly 20 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 2 miles southeast of Amy.

SILVER CREEK.—Borden County; small stream in the eastern part of county flowing southerly 8 miles to its junction with North Fork of Colorado River (tributary to the Colorado) north of Durham.

SILVER CREEK.—Llano County; flows into Sandy Creek (tributary to Colorado River) near Potato Hill in southern part of county; length, 4 miles. Llano topographic map.

SILVER CREEK.—Freestone County; small stream flowing into Alligator Creek (tributary through Buffalo and Upper Keechi creeks to Trinity River) in southwestern part of county.

SILVER CREEK.—Mitchell County; small tributary to Colorado River north of Silver in the southeastern part of the county; length, 3½ miles.

SILVER CREEK.—Parker and Tarrant counties; rises about 2 miles southwest of Veal Station in Parker County; flows southeasterly into West Fork of Trinity River (tributary to Trinity River) 9 miles northwest of Fort Worth in western part of Tarrant County; length, 16 miles. Weatherford and Fort Worth topographic maps.

SILVER LAKE.—Harris County; 7½ miles southeast of Humble; outlet, San Jacinto River which discharges into Gulf of Mexico; one-half mile long and one-twentieth mile wide. Harmaston topographic map.

SILVER LAKE.—Kinney County; in northern part of county; near Swanters ranch; outlet, West Nueces River; no inlet shown on map; length, 2 miles. Nueces topographic map.

SILVERMINE CREEK.—Llano County; an intermittent stream flowing through the southern part of the county into Sandy Creek and thus to the Colorado; length, 3 miles. Llano topographic map.

SIMS BAYOU.—Harris County; rises in the southern part of the county; flows northeasterly 13 miles into Ship Channel (Buffalo Bayou) (and thus to Galveston Bay and Gulf of Mexico) near Clinton; tidal 4 miles in its lower course. Almeda, Bellaire, and Park Place topographic maps.

[illegible]—[illegible] County; rises [illegible] north of [illegible]; flows southerly 8 miles into [illegible] River (tributary to Brazos River) 4 miles northeast of [illegible] topographic map.

[illegible]—[illegible] rises 7 miles [illegible] of [illegible] in [illegible] part of [illegible] County; flows southeastward 25 miles into Lampasas River (tributary to Little River and thus to the Brazos) 2 miles southeast of [illegible] in [illegible] part of Lampasas County. [illegible] topographic map.

[illegible]—[illegible] County; rises in [illegible] part of county, an intermittent stream [illegible] and thus to Guadalupe River.

[illegible]—[illegible] County; a stream flowing southeast of San Saba in the [illegible] part of the county; [illegible] into the San Saba (tributary to Colorado River) [illegible] miles. San Saba topographic map.

[illegible]—[illegible] County; rises about 7 miles southeast of Shelbyville, in southeastern part of county; flows easterly 23 miles into Sabine River about 3 miles north of Hamilton.

[illegible], North Fork—[illegible] County; flows into Sip Bayou (tributary to Sabine River) north of [illegible], in southeastern part of county.

[illegible] Branch—[illegible] County; a northerly flowing stream, 4 miles long uniting with [illegible] Creek (tributary to Leon River and thus through Little River to the Brazos) [illegible] miles southeast of Sipe Springs, in western part of county; passes through Sipe Springs. Eastland topographic map.

[illegible] Creek—[illegible] rises in northwestern part of Motley County; flows northeasterly [illegible] miles to a point about 1 mile east of the northwestern corner of [illegible] County, where it enters Pease River (tributary to Red River and thus to the Mississippi).

[illegible] Creek—[illegible] rises at Howe, in Grayson County; flows southeasterly and southerly 35 miles into East Fork of Trinity (tributary to Trinity River) 2 miles west of Lavon, in Collin County. [illegible] topographic map.

[illegible] Bayou.—Panola County; rises about 3 miles southwest of Carthage; flows easterly 13 miles into Sabine River about 3 miles south of Pulaski.

Sixmile Branch.—Caldwell County; near [illegible]; small intermittent stream flowing into Plum Creek and thus through San Marcos River to the Guadalupe. San Marcos topographic map.

Sixmile Creek.—Bexar County; small intermittent stream flowing into San Antonio River 4 miles south of San Antonio and thus to the Guadalupe. San Antonio topographic map.

Sixmile Creek.—Llano County; rises 2 miles northwest of Oxford, in southern part of county; flows northward 10 miles into Llano River (tributary to the Colorado) 6 miles west of the town of Llano. Llano topographic map.

Sixmile Creek.—Sabine County; rises about 4 miles north of the corner of Newton and Jasper counties, in the southern part of the county; flows easterly 18 miles into Sabine River near Fairdale.

Sixmile Creek.—Young County; a stream flowing northerly 6 miles into Brazos River 2 miles west of New Castle, in western part of county.

Six Shooter Creek.—Stephens County; a small intermittent stream flowing southeastward 3 miles into Hubbard Creek (tributary to Gonzales Creek, thence through Clear Fork of Brazos River to the Brazos) southwest of Crystal Falls, in northern part of county. Breckenridge topographic map.

Sixteenmile Creek.—Fort Bend and Austin counties; a stream 6 miles long flowing northeasterly along the Fort Bend-Austin county line into Brazos River.

SKILLET CREEK.—Donley County; a stream 6½ miles long flowing southerly through northeastern part of county to Whitefish Creek, thence to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red and Red rivers to the Mississippi.

SKINOUT CREEK.—Jones County; an intermittent stream rising near Skinout Mountain and flowing northeasterly 10 miles into California Creek (tributary through Clear Fork of Brazos River to the Brazos) northwest of Anson, in western part of county. Roby topographic map.

SKUNK ARROYO.—Oldham County; rises 18 miles west of Cheyenne; flows northerly into Canadian River (which discharges into the Mississippi through Arkansas River) 10 miles west of Cheyenne, in northern part of county; length, 10 miles; intermittent.

SKUNK CREEK.—Lipscomb County; an intermittent stream rising 10 miles north of Lipscomb and flowing southeasterly to its junction with Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 6 miles east of Lipscomb, in eastern part of county.

SLAPHAM CREEK.—Red River County; rises about 4 miles southeast of Clarksville; flows southerly 4 miles into Guest Creek (tributary through Cuthand Creek to Sulphur River and thus through Red River to the Mississippi).

SLAUGHTER CREEK.—Travis County; an intermittent stream in the southern part of the county; rises near Cedar Valley; flows southeastward 13 miles into Onion Creek (tributary to Colorado River) 1 mile west of Bluff Springs. Austin topographic map.

SLICKROCK CREEK.—Blanco and Llano counties; rises 5 miles west of Round Mountain, in northern part of Blanco County; flows northerly 10 miles to its junction with Colorado River 4½ miles west of the town of Marble Falls, near the Llano-Burnet county line. Blanco and Burnet topographic maps.

SLOAN CREEK.—Fannin County; rises about 5½ miles southeast of Bonham in central part of county; flows northerly 8 miles into Bois d'Arc Creek (tributary to Red River and thus to the Mississippi) 4 miles northeast of Bonham.

SLOUGH BRANCH.—Shelby County; short stream flowing into Tancha Bayou (tributary to Sabine River) northeast of Center in northeastern part of county.

SLOUGH CREEK.—Franklin County; small stream in northern part of county flowing southeasterly 3 miles into Whiteoak Bayou (tributary to Sulphur River, thence through Red River to the Mississippi).

SLOUGH CREEK.—Lamar County; rises in northwestern part of county; flows northerly 7 miles into Red River (tributary to the Mississippi) near Direct, near northwestern corner of county.

SMEATHERS CREEK.—Lavaca County; rises about 3 miles east of Hankhaus; flows southeasterly 11 miles into Rocky Creek (tributary to Lavaca River, Matagorda Bay and Gulf of Mexico) 4 miles southwest of Hallettsville.

SMITH CREEK.—Ellis County; small stream flowing into Trinity River in the eastern part of the county.

SMITH CREEK.—Franklin County; small stream 4 miles long in southwestern part of county flowing southeasterly to Big Cypress Creek, thence to Caddo Lake, and thus through Red River to the Mississippi.

SMITH CREEK.—Grimes County; small stream flowing westward and southwestward 10 miles into Ben Fort Creek (tributary through Navosota River to Brazos River) in north central part of county.

SMITH CREEK.—Gonzales County; small intermittent stream northwest of Gonzales near center of county; flows southerly 9 miles into San Marcos River (tributary to the Guadalupe). Flatonia topographic map.

SMITH CREEK.—Guadalupe County; small intermittent stream southwest of the town of Luling in the northeastern part of the county; flows into San Marcos River (tributary to the Guadalupe). San Marcos topographic map.

SMITH CREEK, NORTH FORK OF.—Gonzales County; rises northwest of the town of Gonzales; flows into Smith Creek (and thus to San Marcos River tributary to the Guadalupe); intermittent. Flatonia topographic map.

SMITH CREEK, DRY FORK OF.—Gonzales County; northwest of Gonzales; unites with Smith Creek, and thus to San Marcos River (tributary to Guadalupe River); intermittent. Flatonia topographic map.

SMOKY CREEK.—Brewster County; formed 12 miles north of Reed Camp in Chisos Mountains by springs unnamed on map; flows southwesterly into Rio Grande 7 miles west of Reed Camp; intermittent. Chisos Mountains topographic map.

SMUGGLERS BAYOU.—Calhoun County; a tidal stream in western part of the county at the mouth of Guadalupe River; flows into Mission Lake and thus through Guadalupe Bayou to San Antonio Bay and thence to Gulf of Mexico.

SNAILUM CREEK.—Shackelford County; rises 2 miles north of Albany; flows easterly 8 miles into Salt prong of Hubbard Creek (tributary through Hubbard to Gonzales Creek, thence through Clear Fork of Brazos River to the Brazos) 7 miles east of Albany. Albany topographic map.

SNAKE CREEK.—Fort Bend County; rises in the western part of the county; flows southerly 11 miles into San Bernard River and thus to Gulf of Mexico.

SNAKE CREEK.—Jack County; joins Carrolls Creek (tributary to West Fork of Trinity River and thus to the Trinity) southeast of the town of Jacksboro in the southern part of this county.

SNAKE CREEK.—McLennan County; an intermittent stream rising near Hill-McLennan County line and flowing southwesterly 4 miles into Aquilla Creek (which discharges into Brazos River) 3 miles southeast of Tyson in northern part of county. Waco topographic map.

SNAKE CREEK.—Tom Green County; a stream 16 miles long flowing through the eastern part of the county to its junction with Lipan Creek (tributary to Concho River and thus to the Colorado.) San Angelo topographic map.

SOAP CREEK.—Ellis County; a northerly flowing stream joining Mountain Creek (tributary to West Fork of Trinity River, thence to the Trinity) in northwestern part of county; length, 7 miles. Cleburne and Fort Worth topographic maps.

SOCAGEE BAYOU.—Panola County; rises about 4 miles northeast of DeBerry; flows southerly 25 miles into Sabine River about 5 miles southwest of Logan.

SOL CREEK.—Mason County; a stream 7 miles long southwest of Fredonia in the northeastern part of the county; empties into Loafer Creek (tributary to Tiger Creek and thus through San Saba River to the Colorado). Mason topographic map.

SORREL CREEK.—Comal County; rises near Cranes Mill in northeastern part of county; empties into Potter Creek, thence to Guadalupe River; intermittent.

SOUTH BEAVER CREEK.—Foard and Wilbarger counties; rises in southeastern part of Foard County; flows easterly 18 miles into Beaver Creek (tributary to Wichita River and thus through Red River to the Mississippi) in southwestern part of Wilbarger County.

SOUTH BEAR CREEK.—Parker County; rises at Parsons in the southeastern part of county; flows southeasterly 8 miles into Bear Creek (tributary to Clear Fork of Trinity River, and thus to the Trinity through West Fork of Trinity River) about 2 miles north of Virgile. Weatherford topographic map.

SOUTH BIDAIS CREEK.—Grimes and Walker counties; rises near Bedias in the northeastern part of Grimes County; flows northeasterly 10 miles through Grimes, then 13 miles through Walker County into Bidais Creek (tributary to Trinity River) northeast of Sion.

SOUTH BINGHAM CREEK.—Montague County; an intermittent stream joining Bingham Branch (which discharges into Clear Creek, thence to Elm Fork of Trinity River and the Trinity) southeast of Forestburg. Montague topographic map.

SOUTH BRADY CREEK.—Menard, Concho, and McCulloch counties; rises 10 miles south of Eden, in the northeastern part of Menard County; flows northeastward 21 miles through the corner of Concho County into Brady Creek (tributary to Colorado River through the San Saba) 10 miles west of Brady, in the western part of McCulloch County. Eden topographic map.

SOUTH COW BAYOU.—McLennan and Falls counties; rises 3 miles north of Moody, in southern part of McLennan County; flows southeasterly 16 miles to its junction with the North Cow Bayou to form Cow Bayou (tributary to the Brazos) 1 mile north of Mooresville, in western part of Falls County. Temple topographic map.

SOUTH COPPERAS CREEK.—Comanche County; rises northeast of May, near Brown-Comanche county line; flows northeasterly 11 miles into Copperas Creek (tributary through Leon and Little rivers to the Brazos) 4 miles southeast of Sipe Springs, in western part of county. Brownwood and Eastland topographic maps.

SOUTH COTTONWOOD CREEK.—Armstrong County; southeastern part; a headwater stream of Cottonwood Creek (tributary to Mulberry Creek and thus through Prairie Dog Town Fork of Red River and Red River to the Mississippi); length, 5 miles.

SOUTH CORRAL CREEK.—Collingsworth County; rises in northeastern part of county and flows northeastward 2 miles to North Corral Creek (tributary to Elm Fork of Red River and thus through North Fork of Red River to the Red and thus to the Mississippi).

SOUTH FISH CREEK.—Cooke County; rises about 3½ miles west of Marysville, in northern part of county; flows easterly 11 miles to its junction with North Fish Creek to form Fish Creek (tributary to Red River and thus to the Mississippi) about 6½ miles east of Marysville. Gainesville topographic map.

SOUTH GRAPE CREEK.—Gillespie County; joint Pedernales River (tributary to the Colorado 2 miles southwest of Stonewall, in the southern part of the county; length, 11 miles. Fredericksburg topographic map.

SOUTH JIM NED CREEK.—Coleman County; small stream flowing into Jim Ned Creek (tributary to Pecan Bayou and thus to the Colorado) in northwestern part of county, southeast and northeast of Atoka; length, 13 miles. Abilene and Ballinger topographic maps.

SOUTH LEON CREEK.—Comanche County; rises in southwestern corner of county at an approximate altitude of 1,600 feet above sea level; flows northeasterly 25 miles, passes through the village of Newburg, into Leon River (tributary to Little River and thus to the Brazos) 2 miles north of Siloam. Brownwood and Hamilton topographic maps.

117992°—19—WSP 448——15

South Mayde Creek.—Harris County; rises 3½ miles north of Katy, near South Mayde School; flows southeasterly 15½ miles into Buffalo Bayou (tributary to San Jacinto, Trinity, and Galveston bays, and thus to the Gulf of Mexico); intermittent. Katy, Addicks, and Hillendahl topographic maps.

South Mesquite Creek.—Dallas County; rises near Reinhardt; flows southeasterly 13 miles into East Fork of Trinity River (tributary to Trinity River) about 2 miles east of Haughts Store. Dallas and Barnes Bridge topographic maps.

South Noland Creek.—Bell County; rises 3 miles west of Killeen, in western part of county; flows easterly 18 miles to a point 3 miles northwest of Belton, where it enters Noland Creek (tributary to Leon River and thus through Little River to the Brazos). Gatesville topographic map.

South Palo Pinto Creek.—Palo Pinto and Eastland counties; rises 4 miles north of Desdemona in eastern part of Eastland County; flows northerly 19 miles to its junction with North Palo Pinto Creek to form Palo Pinto Creek (tributary to Brazos River) at Mingus in southwestern part of Palo Pinto County. Eastland, Stephenville, and Palo Pinto topographic maps.

South Paluxy Creek.—Erath County; rises 6 miles north of Stephenville; flows northeasterly 12 miles to its junction with North Paluxy Creek to form Paluxy Creek (tributary to Brazos River) 1 mile west of Bluff Dale in northern part of county. Stephenville topographic map.

South Fork Pecan or Chambers Creek.—Johnson and Ellis counties; rises 4 miles south of Cuba in the south central part of Johnson County; flows southeasterly 20 miles to a point in the southwestern part of Ellis County, where it joins the North Fork of Pecan Creek forming Pecan Creek (tributary to Richland Creek and Trinity River). Cleburne topographic map.

South Plum Creek.—Moore County; rises in south central part of county; flows easterly 8 miles into Plum Creek (tributary to Canadian River, which discharges into the Mississippi, through Arkansas River) near Potter-Moore County line.

South Rocky Creek.—Burnet County; rises 3 miles northwest of Sunnylane in northeastern part of county; flows easterly 14 miles to its junction with North Rocky Creek to form Rocky Creek (tributary to Lampasas River and thus through Little River to the Brazos) southwest of the village of Oakalla. Georgetown and Burnet topographic maps.

South Sandy Creek.—Colorado and Lavaca counties; small stream flowing southeasterly along the line between Colorado and Lavaca counties to its junction with Sandy Creek (tributary to Navidad River, the Lavaca, Matagorda Bay, and Gulf of Mexico) in the southern part of Colorado County.

South Walnut Creek.—Robertson County; rises at Owensville; flows westerly into Walnut Creek (tributary to Little Brazos River and thus to the Brazos) 4 miles northeast of Calvert.

South Willow Creek.—Llano County; a small intermittent tributary through North Willow Creek to San Fernando Creek and thus through Llano River to the Colorado in the northwestern part of the county; *length*, 4 miles. Llano topographic map.

South Concho Draw.—Schleicher County; an intermittent water *course* in the northern part of the county; flows northward 10 miles into South Concho River (tributary to Concho River and thus to the Colorado). Fort McKavett and San Angelo topographic maps.

South Bosque River.—McLennan County; rises 3 miles southeast of Oglesby near Coryell-McLennan County line; flows northeasterly 24 miles into Bosque River (tributary to Brazos River) 5 miles above mouth of Bosque River, 4 miles northwest of Waco in central part of county. Temple and Waco topographic maps.

South Bosque River.—Erath County; rises 5 miles north of Lingleville; in western part of county; flows southeasterly 14 miles into Bosque River (tributary to the Brazos River) 1 mile north of Stephenville. Stephenville topographic map.

South Concho River.—Tom Green and Schleicher counties; rises 8 miles northeast of Eldorado in the central part of Schleicher County at an approximate altitude of 2,400 feet above sea level; flows northward 13 miles through Schleicher, then 28 miles through Tom Green County to its confluence with North Concho River forming Concho River (tributary to the Colorado) in the city of San Angelo near the central part of Tom Green County; drainage area, 3,260 square miles. Sherwood and San Angelo topographic maps. (See Concho River).

South Fork of Sabine River.—Rockwall and Hunt counties; rises about 2 miles east of Chisholm in Rockwall County; flows easterly 19 miles to its junction with Caddo Fork of Sabine River (thence to Sabine River) in the southeastern corner of Hunt County.

South Llano River.—Edwards and Kimble counties; rises in the north central part of Edwards County at approximate altitude, 2,300 feet above sea level; flows northeastward 55 miles to its confluence with North Llano River at Junction near the center of Kimble County, forming Llano River (tributary to Colorado River). A large part of the flow of Llano River is contributed by South Llano River. (See Llano River). Rock Springs topographic map.

South Pease River.—Motley, Dickens, and Cottle counties; formed about 4 miles southeast of Roaring Springs in southwestern part of Motley County by confluence of Olive Fork of Pease River and Walnut Creek; flows northeastward into Middle Pease River (tributary through Pease River to Red River and thus to the Mississippi) about 10 miles northwest of Paducah in western part of Cottle County; length, 42 miles.

South Sulphur River.—Fannin, Hunt, Delta, Lamar, and Hopkins counties; rises in the southern part of Fannin County about a mile south of Bailey; flows southeasterly and easterly 60 miles to its junction with North Sulphur River forming Sulphur River (tributary to Red River and thus to the Mississippi) at the corner of Lamar, Delta, and Hopkins counties, 4 miles northeast of Sulphur Bluff.

South Wichita River (Salt Fork of Wichita, or South Fork of Big Wichita).—Dickens, King, Knox, and Baylor counties; rises in the northeastern part of Dickens County; flows easterly 85 miles to its junction with North Wichita River to form Wichita River (tributary to Red River, which discharges into the Mississippi) east of Noview in northwestern part of Baylor County.

Sowells Creek.—Comanche and Erath counties; rises near Dublin in southern part of Erath County; flows southwesterly into Leon River (tributary to Little River and thus to the Brazos) 2 miles southwest of Camden in southeastern part of Comanche County. Stephenville and Hamilton topographic maps.

Spade Branch.—Dickens County; small stream flowing into Duck Creek (which discharges into Brazos River through the Salt Fork of the Brazos) 3 miles southeast of Spur in southern part of county; length, 8 miles.

SPANISH OAK CREEK.—Caldwell County; rises south of Dale in the northeastern part of the county; flows into Dry Creek (tributary through Plum Creek to the San Marcos River and thus to the Guadalupe). San Marcos topographic map.

SPANISH OAK CREEK.—Travis and Burnet counties; small stream following line between Travis and Burnet counties 3 miles to its junction with Colorado River, 3 miles southeast of Smithwick. Burnet topographic map.

SPARERIB CREEK.—Burnet County; rises 4 miles northwest of Fairland in the southern part of county; flows southeastward 6 miles into Backbone Creek (tributary to Colorado River) about 1 mile north of Granite Mountain. Burnet topographic map.

SPEER CREEK.—San Augustine County; rises about 6 miles west of San Augustine; flows southwesterly 17 miles into Attoyac Bayou (tributary to Angelina river and thus to Neches River) west of Broaddus in the southwestern part of the county.

SPENCER CREEK.—Presidio County; rises at Spencer Spring 9 miles west of Shafter in western part of county; flows southwesterly into Rio Grande at Borracho; intermittent. Ruidoso and Shafter topographic maps.

SPICER CREEK.—Bastrop County; just north of Bastrop in the north central part of the county; tributary through Piney Creek to Colorado River. Bastrop topographic map.

SPINDLETOP BAYOU.—Jefferson and Chambers counties; rises in the southwestern part of Jefferson County; flows westerly into Elm Bayou (tributary to East Bay Bayou, thence to East Galveston Bay and Gulf of Mexico).

SPILLER OR BUCK CREEK, NORTH FORK.—Donley and Collingsworth counties; rises in the southeastern part of Donley County; flows southeasterly 10 miles into Spiller Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in the southwestern part of Collingsworth County.

SPILLER OR BUCK CREEK.—Donley, Collingsworth, and Childress counties; rises in southeastern part of Donley County; flows southeasterly 49 miles to its intersection with Texas-Oklahoma boundary line, then three miles through Harmon County, Oklahoma, into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi).

SPRING BRANCH.—Waller County; rises 5 miles east of the town of Hempstead; flows southwesterly 15 miles into the Brazos.

SPRING BRANCH.—Harris County; small stream flowing southerly 2½ miles into Buffalo Bayou (tributary to Galveston Bay and thus to Gulf of Mexico) in the southern part of the county. Hillendahl and Houston Heights topographic maps.

SPRING BRANCH.—King County; small stream rising in the eastern part of county and flowing northerly 5 miles into South Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

SPRING BRANCH.—Jones County; an intermittent stream rising 5 miles east of Anson in northeastern part of county; flows northeasterly 10 miles to a point near Avoca, where it enters California Creek and thus through Clear Fork of Brazos River to the Brazos. Anson topographic map.

SPRING BRANCH.—Bastrop County; rises in the south central part of the county; flows into Sandy Creek and thus through Walnut Creek to Colorado River; length, 2 miles. Flatonia topographic map.

SPRING CREEK.—Cooke County; flows southeasterly 15 miles into Elm Fork of Trinity River (tributary to the Trinity) in the southern part of the County. Gainesville topographic map.

SPRING CREEK.—Dawson County; a stream approximately 10 miles in length rising in the northeastern part of the county and flowing into Colorado River.

SPRING CREEK.—Edwards County; a tributary in the southeastern part of the county; flows northeasterly 8 miles to its junction with Pulliam Creek thence to Nueces River north of Military Mountain. Nueces topographic map.

SPRING CREEK.—Gillespie County; a stream flowing southeasterly 13 miles to its junction with Pedernales River (tributary to Colorado River) 9 miles west of Fredericksburg in the southwestern part of the county. Kerrville topographic map.

SPRING CREEK.—Gonzales County; rises northwest of Possumtrot in northern part of county; small intermittent tributary to Sandy Fork of Peach Creek, thence to Peach Creek and Guadalupe River. Flatonia topographic map.

SPRING CREEK.—Hutchinson and Moore counties; rises 3 miles west of White Deer Creek in northern part of Carson County; flows northerly into Canadian River (tributary through Arkansas River to the Mississippi) 4 miles east of Plemons in eastern part of Hutchinson County.

SPRING CREEK.—Jasper County; flows southwesterly 5 miles into Neches River in the northwestern part of the county.

SPRING CREEK.—Nolan and Taylor counties; rises 4 miles southwest of Dora in the southeastern part of Nolan County; flows southeastward 12 miles in Valley Creek (tributary to Colorado River) 5½ miles east of Hylton in the southwestern part of Taylor County. Sweetwater topographic map.

SPRING CREEK.—Parker County; rises south of Weatherford along the Santa Fe Railway in southern part of the county; flows southerly 7 miles into Brazos River 3 miles northwest of Center Mill. Weatherford topographic map.

SPRING CREEK.—Potter and Moore counties; a stream 2 miles long rising in the northeastern corner of Potter County and flowing northerly into Canadian River (tributary to Arkansas River and thus to the Mississippi) in the southeastern corner of Moore County.

SPRING CREEK.—Schleicher, Crockett, Irion and Tom Green counties; rises 4 miles south of the corner common to Schleicher, Irion, and Crockett counties; flows northeastward 27 miles through Irion County, then 13 miles through Tom Green County into Middle Concho River (tributary to South Concho River, and thus through the Concho to Colorado River) 8 miles southwest of San Angelo in the western part of Tom Green County. Valley lands are irrigated in vicinity of Mertzon and Sherwood. Sherwood topographic map.

SPRING CREEK.—Victoria County; small stream in central part of county; joins Guadalupe River 2 miles north of the town of Victoria.

SPRING CREEK.—Anderson County; small stream in northwestern part of county flowing southwesterly 7 miles into Trinity River.

SPRING CREEK.—Bandera County; small intermittent stream in eastern part of county; joins Medina River (tributary through San Antonio River to the Guadalupe) 3½ miles northwest of Bandera.

SPRING CREEK.—Blanco County; flows into North Grape Creek (tributary through Pedernales River to Colorado River) west of Sandy in the western part of the county; length, 4 miles. Fredericksburg and Blanco topographic maps.

SPRING CREEK.—Bowie County; rises about 7 miles southwest of Texarkana in western part of county; flows southerly 5½ miles into Sulphur River (tributary to Red River and thus to the Mississippi) about 4 miles west of Leary. Texarkana topographic map.

SPRING CREEK.—Bosque County; rises 2 miles east of Spring Creek Gap in western part of county; flows southeasterly 15 miles into Meridian Creek (tributary through Bosque River to the Brazos) 8 miles southwest of Meridian. Meridian topographic map.

SPRING CREEK.—Burnet County; rises three miles west of the town of Burnet in the western part of the county; flows westward 7 miles into Colorado River. Burnet topographic map.

SPRING CREEK.—Burleson County; rises 3 miles north of Caldwell in northern part of county; flows easterly 7 miles into Brazos River.

SPRING CREEK.—Collin and Dallas counties; rises in southwestern part of Collin County; flows southeasterly 8 miles into Rowlett Creek (tributary to East Fork of Trinity River and thus to the Trinity) in northeastern corner of Dallas County 4 miles northeast of Garland. Dallas topographic map.

SPRING CREEK.—Crosby County; rises in southwest part of county; flows southeasterly 6 miles into North Fork of Double Mountain Fork of Brazos River (tributary through the Double Mountain Fork to the Brazos) near Crosby-Garza County line.

SPRING CREEK.—Grayson County; headwater stream of East Fork of Trinity River (tributary to Trinity River) in southern part of county.

SPRING CREEK.—Donley County; a stream 6 miles long flowing southerly in northwestern part of county and entering Salt Fork of Red River (tributary to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi).

SPRING CREEK.—Donley County; small stream flowing southerly through east central part of county into Cow Creek (tributary through Salt Fork of Red River to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi); length 2½ miles.

SPRING CREEK.—Donley County; rises about 7 miles northeast of Clarendon; flows northeasterly 2½ miles into Salt Fork of Red River (tributary through Prairie Dog Town Fork of Red River to the Red and thus to Mississippi River).

SPRING CREEK.—Erath County; an eastward flowing stream 8 miles long, joining Bosque River (tributary to the Brazos) 3 miles west of Hico in southern part of county. Hamilton and Stephenville topographic maps.

SPRING CREEK.—Gillespie and Mason counties; a stream in the southeastern part of Mason County and northern part of Gillespie County; flows 6 miles to its junction with Beaver Creek and thus through Llano River to the Colorado. Mason and Kerrville topographic maps.

SPRING CREEK.—Grayson County; rises near Macomb; flows southwesterly 8 miles into Range Creek (tributary to Isle du Bois Creek, and thus through Elm Fork of Trinity River to the Trinity) about 3 miles south of Collinsville; intermittent. Denison topographic map.

SPRING CREEK.—Grimes County; tributary to Holland Creek (which discharges into Navasota River and thus to the Brazos) northeast of the town of Navasota. Navasota topographic map.

SPRING CREEK.—Kerr County; flows into Johnson Creek (tributary to the Guadalupe) at Resort in the northeastern part of county. Kerrville topographic map.

SPRING CREEK.—Kendall County; small stream flowing through southeastern part of county into Guadalue River.

SPRING CREEK.—Leon County; rises about 1 mile southeast of Robbins; flows southeasterly 7 miles into Boggy Creek (tributary to Trinity River).

SPRING CREEK.—Live Oak County; rises in the southwestern part of the county; flows northeasterly 18 miles into Nueces River at Mikeska.

SPRING CREEK.—Motley County; rises in the eastern part of county; flows eastward 8 miles into Middle Pease River (tributary through Pease River to Red River and thus to the Mississippi) about 2 miles north of Teepee City.

SPRING CREEK.—Motley County; small stream in southwestern part of county flowing into Walnut Creek (tributary to South Pease River and thus through Middle Pease, Pease, and Red rivers to the Mississippi).

SPRING CREEK.—Robertson County; small stream flowing southwesterly 11 miles into Little Brazos River (tributary to Brazos River) north of Benchley.

SPRING CREEK.—San Saba County; rises north of the town of San Saba in northeastern part of the county; flows 5 miles into Colorado River. San Saba topographic map.

SPRING CREEK.—Sabine County; small stream flowing into Richland Creek (thence to Sixmile Creek and Sabine River) in southeastern part of county.

SPRING CREEK.—Shackelford County; rises near Callahan-Shackelford county line; flows northerly 12 miles to a point 2 miles south of Rising Sun in western part of Shackelford County, where it enters Deadman Creek which discharges into Brazos River through the Clear Fork of the Brazos. Anson and Albany topographic maps.

SPRING CREEK.—Waller, Harris, and Montgomery counties; rises in northeastern part of Waller County; flows easterly forming the boundary between Waller and Harris counties for 11 miles (practically from its source) then 40 miles between Montgomery and Harris counties to its junction with San Jacinto River (thence to Galveston Bay and Gulf of Mexico), 2 miles north of Humble. Joseph, Waller, Hockley, Rose Hill, Stuebner, Spring and Weeden topographic maps.

SPRING CREEK.—Young, Archer, and Throckmorton counties; a southward flowing stream joining Brazos River at Spring Creek in northeastern part of Throckmorton County; length, 7 miles.

SPRING GULLY.—Harris County; rises in northwestern part of county, 3½ miles northeast of Louetta; flows southeasterly 3½ miles into Cypress Creek (tributary to Spring Creek); intermittent. Louetta and Spring topographic maps.

SPRING LAKE.—(McFarland Lake); Bowie County; about 4½ miles southeast of Maud, in southern part of county; formed by an old channel of Sulphur River (which discharges into the Mississippi through Red River). New Boston topographic map.

SPUR CREEK.—Runnels County; a small intermittent stream south of Ballinger in the southern part of the county; flows 4 miles into Colorado River. Ballinger topographic map.

SPRING GULLY.—Harris County; formed 4 miles southwest of Crosby by Ingrando Marsh; flows easterly one-half mile; from this point it continues as Granite Creek (tributary to San Jacinto River and thus to Gulf of Mexico); intermittent. Harmaston topographic map.

SQUAW CREEK.—Gillespie County; rises 7 miles southwest of Cherry Springs; flows northerly 8 miles into Spring Creek (tributary to Threadgill Creek, thence through Beaver Creek to Llano River and thus to the Colorado); intermittent. Kerrville topographic map.

SQUAW CREEK.—Hardeman County; a stream 6 miles long flowing easterly through northeastern part of county to Red River, which discharges into the Mississippi.

SQUAW CREEK.—Parker County; small stream flowing into Clear Fork of Trinity River (tributary to West Fork of Trinity River and thus to the Trinity) northeast of Annetta. Weatherford topographic map.

SQUAW CREEK.—Somervell and Hood counties; rises near Tolar in southern part of Hood County; flows southeasterly 20 miles into Brazos River, 3 miles northeast of Glenrose in eastern part of Somervell County. Granbury topographic map.

SQUAW CREEK.—Throckmorton County; a northerly flowing stream 3 miles long joining Millers Creek (tributary to the Brazos) in northwestern part of county.

SQUIRREL CREEK.—Cooke County; small intermittent stream flowing into Dry Elm Creek (tributary to Elm Fork of Trinity River, and thus to the Trinity) about 3 miles northeast of [illegible]. Gainesville topographic map.

SQUIRREL CREEK.—Grayson County; rises about 3 miles northwest of Howe; flows southerly 6 miles into East Fork of Trinity River (tributary to Trinity River) near south line of Grayson County.

STAG BRANCH.—Runnels County; an intermittent stream 2 miles in length rising southeast of Ballinger in the southern part of the county and flowing into Colorado River. Ballinger topographic map.

STAMPEDE CREEK.—Bell and McLennan counties; rises near Moody in southern part of McLennan County; flows southwesterly 9 miles into Leon River River (tributary to Little River and thus to the Brazos) 2 miles northeast of Moffat. Temple topographic map.

STAMPEDE CREEK.—Coryell County; an intermittent stream east of Pidcoke in southern part of county; flows southerly 7 miles into Cowhouse Creek (tributary to Leon River and thus through Little River to the Brazos). Gatesville topographic map.

STANLEY CREEK.—Angelina County; small stream flowing northeasterly 9 miles into Angelina River (tributary to the Neches) in the northeastern part of the county.

STAR HOLLOW CREEK.—Hood County; flows northeasterly 5 miles to its junction with Robinson Creek (tributary to Brazos River) 5½ miles northwest of Thorpe Springs in northern part of county. Granbury topographic map.

STATE LINE CREEK.—Cass County, Tex., Miller County, Ark., and Caddo Parish, La.; rises at Bloomburg in northeastern part of Cass County, Tex.; flows southeasterly 14 miles, crosses a corner of Arkansas and enters Black Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi) in Caddo Parish, La.

STATION BRANCH.—Johnson and Hood counties; rises in western part of Johnson County, 2½ miles northeast of Falls; flows southwesterly 4 miles into Hood Creek (tributary to Fall Creek and thus to Brazos River). Granbury topographic map.

STATION CREEK.—Coryell County; small stream flowing southerly to a point near Eagle Springs in eastern part of county, where it enters Leon River and thus through Little River to the Brazos; length, 6 miles. Gatesville and Temple topographic maps.

STEELE CREEK.—Bosque County; rises two miles west of Walnut in northern part of county; flows easterly 23 miles into Brazos River 2 miles east of Fowler. Granbury and Cleburne topographic maps.

STEELMAN BRANCH.—Montague County; a small intermittent stream flowing into Mallard Creek (tributary to Denton Creek, then through Elm Fork of the Trinity to Trinity River) northwest of Mallard. Montague topographic map.

STEETES CREEK.—Robertson and Limestone counties; rises 5 miles northwest of Thornton in southwestern part of Limestone County; flows southeasterly 27 miles into Navasota River (tributary to Brazos River) 7 miles south of the Limestone-Robertson County line.

STEPHENS CREEK.—Wichita County; rises 7 miles northwest of Iowa Park; flows southerly 8½ miles into North Fork of Buffalo Creek (tributary through Wichita River to Red River and thus to the Mississippi); intermittent. Clara and Iowa Park topographic maps.

STEPPE CREEK.—Brown County; a stream to the north and west of Ricker in the southeastern part of the county; flows into Pecan Bayou and thus to Colorado River; length, 13 miles. Brownwood topographic map.

STERLING CREEK.—Reagan, Glasscock, and Sterling counties; rises in the northern part of Reagan County; flows northeastward 35 miles into North Concho River (tributary to Concho and Colorado rivers) 4 miles southeast of Sterling City near the center of Sterling County.

STEWART CREEK.—Bowie County; a small stream rising about 3 miles northeast of Sims and flowing into Anderson Creek (tributary to Sulphur River and thus through Red River to the Mississippi) in western part of county. New Boston topographic map.

STEWARTS CREEK.—Denton County; joins Elm Fork of Trinity River (tributary to Trinity River) in southeastern part of county.

STIFF OR BUFFALO CREEK.—Collin County; rises 2 miles east of Melissa; flows southeasterly 6 miles into Sister Grove Creek (tributary to East Fork of Trinity River, and thus to the Trinity) about 2 miles south of Altoga.

STILLS CREEK.—Anderson County; rises about 3 miles southeast of Palestine; flows easterly 12 miles into Neches River in the eastern part of county.

STILLHOUSE CREEK.—Montague County; small intermittent stream flowing to a point north of Salona, where it enters Denton Creek, and thus to Elm Fork of Trinity River (tributary to the Trinity). Montague topographic map.

STILLWELL CREEK.—Brewster County; an intermittent stream in southeastern part of the county; flows southeasterly 13 miles into Rio Grande, 15 miles northeast of Boquillas. Chisos Mountains topographic map.

STINK CREEK.—Nolan County; an intermittent stream 7 miles long flowing into Sweetwater Creek (tributary through Clear Fork of Brazos River to the Brazos) 2 miles east of Eskota in northeastern part of county. Sweetwater and Roby topographic maps.

STONE BAYOU.—Shelby County; small tributary to Sabine River north of Hamilton in southeastern part of county.

STONE BRIDGE CREEK.—Mason County; a small intermittent stream flowing through the eastern part of the county south of Bodeville into Herman Creek (tributary to Llano River and thus to the Colorado); length, 4 miles. Mason topographic map.

STONE COAL BRANCH.—Robertson County; small stream flowing southwesterly 3½ miles into Duck Creek (tributary through Navasota River to the Brazos) north of Lake.

[illegible] Creek.—[illegible] County; rises in western part of county; flows south[illegible] [illegible] miles into Navasota River and thus to the Brazos. Navasota [illegible] map.

[illegible] Creek.—[illegible] County; rises in the central part of the county; flows [illegible] miles into [illegible] River.

[illegible] Creek.—[illegible] County; a stream flowing northeasterly 4 miles into [illegible] Creek and thus to Brazos [illegible] Mill in northern part of county. [illegible] map.

[illegible] Creek.—[illegible] and Maverick counties; small intermittent tributary [illegible] Nueces River; rises in Anacacho Mountains [illegible] County; flows southward 11 miles into [illegible] Maverick County. Brackett topographic map.

[illegible] Creek.—Cherokee and Rusk counties; rises in eastern part of Cherokee [illegible] Cherokee and Rusk counties; flows south[illegible] River (thence to Nueces River) [illegible] Rusk County.

[illegible] Creek.—[illegible] easterly [illegible] miles into Brazos River [illegible] eastern part of county. Granbury [illegible] map.

[illegible] Creek.—[illegible] County; rises in northern part of the county [illegible] southeasterly [illegible] miles into San Bernard River [illegible].

[illegible] Creek.—[illegible] County; rises about 3 miles south of Gilmer; flows [illegible] Big Cypress Creek (tributary to Caddo Lake, and thus through Red River to the Mississippi).

[illegible] Lake.—[illegible] County; in eastern part; an expansion of North [illegible] of Red River, tributary to Red River, which discharges into the Mississippi. [illegible] square mile.

[illegible] Creek.—[illegible] County; small tributary to Housing Bayou, thence to Sabine River about [illegible] miles south of Hemphill.

Sugar Creek.—Upshur County; rises about 2 miles south of Gilmer in central part of county; flows northeasterly 5 miles into Little Cypress Creek (tributary to Caddo Lake, thence to Red River and thus to the Mississippi).

Sulphur Branch.—[illegible] County; [illegible] northwest of Moulton in northeastern part of county; [illegible] Peach Creek, and thus to Guadalupe River. Flatonia topographic map.

Sulphur Branch.—Tarrant County; rises 1½ miles northwest of Bedford; flows southerly 3½ miles into a creek not named on the map (tributary to West Fork of Trinity River). Fort Worth topographic map.

Sulphur Creek.—Culberson County; an intermittent stream 8½ miles north of Van Horn in southwestern part of county; flows easterly 15 miles, where it sinks in sands. Van Horn topographic map.

Sulphur Creek.—Lampasas County; formed in the town of Lampasas in southern part of county by union of Burleson and Donaldson creeks and several large springs; flows easterly 10 miles into Lampasas River (tributary to Brazos River through Little River). Lampasas topographic map.

Sulphur Springs Creek.—Terry, Dawson, and Martin counties; an intermittent stream rising north of Pride in southeastern corner of Terry County; flows southeastward 65 miles into Girands Creek (tributary to Colorado River), northeast of Stanton in the eastern part of Martin County.

SULPHUR RIVER.—Red River, Franklin, Titus, Morris, Bowie, and Cass counties; formed 4 miles northeast of Sulphur Bluff at the eastern extremity of Delta County by junction of North and South Sulphur rivers; flows easterly 75 miles, crosses eastern boundary of State 10 miles south of Texarkana, thence continuing in an easterly direction 15 miles to a point about 2 miles northeast of Doddridge in the southern part of Miller County, Ark., where it enters Red River (tributary to the Mississippi). Daingerfield, New Boston, Linden, Texarkana, and Atlanta topographic maps.

SUNFLOWER CREEK.—Wilbarger and Wichita counties; rises in eastern part of Wilbarger County; flows southeasterly 8 miles into Beaver Creek (tributary to Wichita River and thus through Red River to the Mississippi) in the southeastern part of Wichita County.

SUPPLE JACK CREEK.—Lavaca County; rises 3 miles southeast of Yoakum; flows southeastward 10 miles into Clarks Creek (tributary to Lavaca River, Matagorda Bay and Gulf of Mexico) in southwestern part of county.

SUTHERLAND CANYON.—King and Stonewall counties; small intermittent stream 5 miles long flowing southerly into Salt Fork of Brazos River and thus to the Brazos.

SUTHERLANDS CREEK.—Jackson County; small stream in northern part of county flowing southeasterly into Brushy Creek (thence to Sandy Creek, Navidad and Lavaca rivers, Matagorda Bay, and Gulf of Mexico).

SWAGER CREEK.—Shackelford County; rises 8 miles northwest of Albany; flows northwesterly 12 miles into Clear Fork of Brazos River (tributary to the Brazos) in northwestern part of county. Anson and Albany topographic maps.

SWAUANO CREEK.—Titus County; rises about 6 miles west of Mount Pleasant; flows southerly 14 miles into Big Cypress Bayou (tributary through Caddo Lake to Red River and thus to the Mississippi) in the southeastern part of county.

SWEETWATER CREEK.—Comanche County; rises near Logan Gap 2 miles east of Whitville in southern part of county; flows northeasterly 15 miles into Copperas (Rush) Creek (tributary through Leon and Little rivers to the Brazos) 7 miles southwest of DeLeon. Brownwood and Eastland topographic maps.

SWEETWATER CREEK.—Jones, Fisher, and Nolan counties; rises near Maryneal; flows northeastward 45 miles into Clear Fork of Brazos River (which discharges into the Brazos) 4 miles southeast of Newman in western part of Jones County. Sweetwater and Roby topographic maps.

SWINDLERS CREEK.—Newton County; small stream flowing into Plum Creek (tributary to Sabine River through Little Cow Creek) about 4 miles east of Burkeville.

SWAN LAKE.—Galveston County; south of Texas City in central part of the county on the west side of Galveston Bay, thence to Gulf of Mexico.

SYCAMORE BRANCH.—Burnet County; stream 2 miles long in the northwestern part of the county; tributary to Colorado River. Burnet topographic map.

SYCAMORE CREEK.—Burnet County; small stream flowing into Colorado River 4 miles east of Marble Falls in the southern part of the county; length, 7 miles. Burnet topographic map.

SYCAMORE CREEK.—Cooke County; a small intermittent stream flowing into Red River (tributary to the Mississippi) in extreme northeastern part of county. Denison topographic map.

ᴀɴᴄʜᴀ Bayou.—Shelby County; rises about 2 miles north of Timpson in the northwestern part of the county; flows easterly 36 miles into Sabine River 5 miles southeast of Dacha.

ᴀɴᴄʜᴀ Bayou, South Fork.—Shelby County; rises about 8 miles southwest of Shelbyville; flows northeasterly 18 miles into Tancha Bayou (tributary to Sabine River) 9 miles northeast of Shelbyville.

ᴀɴᴋ Creek.—King County; rises in northwestern part of county; flows southeasterly 7 miles into Willow Creek (tributary to South Wichita River and thus through Wichita and Red rivers to the Mississippi).

ᴀɴᴋᴀʀᴀ Creek.—Karnes County; north of Helena in the eastern part of the county; flows southwesterly 11 miles into Ecleto Creek and thus through San Antonio River to the Guadalupe.

ᴀɴᴋᴇʀsʟʏ Creek.—Titus County; rises about 5 miles northwest of Mount Pleasant in western part of county; flows southeasterly 10 miles into Big Cypress Bayou (tributary to Caddo Lake and thus through Red River to the Mississippi), in the southern part of the county.

'ᴀɴʏᴀʀᴅ Branch.—Bell County; rises in northern part of county; flows into Leon River and thus to Little River west of Howard; intermittent. Tempel topographic map.

'ᴀᴘᴀᴅᴏ Canyon.—Presidio County; an intermittent stream flowing southwesterly 8 miles entering Rio Grande 4 miles southeast of Santiago in southern part of county. Polvo topographic map.

Tᴀʀᴀɴᴄᴀʜᴜᴀs Creek.—Duval County; small intermittent tributary to San Diego Creek (thence to Gulf of Mexico through Chiltipin, Pinias, and Santa Petronilla creeks and Baffins Bay) in northeastern part of county.

Tᴀʀᴋɪɴɢᴛᴏɴ Creek.—Liberty County; rises in the northwestern part of the county; flows southerly to its junction with Luces Bayou (tributary to East San Jacinto River, San Jacinto River, and Gulf of Mexico) in the west central part of the county.

Tᴀʀʀᴀɴᴛ Creek.—Motley County; rises in southeastern part of county; flows northeasterly 4½ miles into Salt Creek (tributary through South Pease to Middle Pease River and thus through Pease and Red rivers to the Mississippi).

Tᴀʏʟᴏʀs Bayou.—Harris County; rises in the southeastern corner of the county; flows southwesterly 4½ miles into Taylor Lake, thence to Clear Lake (thence to Galveston Bay and thus to Gulf of Mexico) about 1½ miles west of Seabrook; tidal about 2 miles in its lower course. La Porte and Seabrook topographic maps.

Tᴀʏʟᴏʀs Bayou, North Fork.—Jefferson County; rises about 2 miles north of Morey in the western part of the county; flows southeasterly into Taylors Bayou and thus through Sabine Lake to Gulf of Mexico, 2½ miles southwest of LaBelle; length, 8 miles.

Tᴀʏʟᴏʀs Bayou.—Jefferson County; rises in western part of the county in a fresh-water marsh north of Hamshire; flows easterly 30 miles into Sabine Lake (thence through Sabine Pass to the Gulf of Mexico) 2 miles south of Port Arthur; tidal to a point near the center of county; channel irregular; 10 to 15 feet deep and 200 to 400 feet wide along the lower portion.

Tᴀʏʟᴏʀ Creek.—Lampasas and Coryell counties; rises near Beecham Gap in southern part of Coryell County; flows southwesterly 7 miles, passing through the town of Kempner into Lampasas River (tributary through Little River to the Brazos) in southeastern part of Lampasas County. Gatesville topographic map.

[illegible] —[illegible] County; rises [illegible] miles northwest of Albany; flows [illegible] Creek tributary through Clear Fork of [illegible] to the Brazos) [illegible] miles northeast of Round Hill in northern [illegible] topographic map.

[illegible] —[illegible] small tributary to Murvalls Bayou (thence [illegible] in southwestern part of county near Dotson.

[illegible] —[illegible] rises in southwestern part, 3½ miles west [illegible] miles into Rio Grande; intermittent. [illegible] map.

[illegible] small intermittent stream in southwestern [illegible] miles into Chacareco Creek [illegible] Creek).

[illegible] rises [illegible] miles north of Bush in southwestern [illegible] miles into Canadian River (tributary [illegible] the Mississippi) 5 miles northeast [illegible]

[illegible] a stream 5 miles long rising in southwestern [illegible] into Double Mountain Fork of Brazos [illegible] Brazos).

[illegible] a stream 7 miles long flowing easterly [illegible] into Red River, which discharges [illegible]

[illegible] County; rises about 3½ miles northeast of [illegible] county; flows northeasterly 23 miles [illegible] Pease River and thus through Red [illegible] miles north of Tongue City.

TEHUACAN CREEK.—[illegible] rises at Abbott; flows southerly 30 miles into Brazos River [illegible] southeast of Waco in central part of county. Waco topographic map.

TEHUACAN CREEK, EAST FORK.—McLennan County; rises 2 miles northeast of Abbott; flows southeasterly into Tehuacan Creek (tributary to Brazos River) in northern part of State.

TEHUACAN CREEK, SOUTH FORK.—Limestone and McLennan counties; rises in western part of Limestone County; flows southwesterly into Tehuacan Creek (tributary to Brazos River) 5 miles northeast of Waco in central part of county. Waco topographic map.

TEHUACANA CREEK.—Freestone County; rises about 2 miles southwest of Tehuacana; flows northeasterly 29 miles across the county into Trinity River 7 miles north of Troy.

TEHONDA CREEK.—Webb County, an intermittent stream; rises in southwestern part of county; flows southwesterly 7 miles into San Isabel Creek (tributary to Rio Grande) northwest of Laredo.

TEMACANA CREEK.—Nacogdoches County; rises in northern part of county; flows easterly 4 miles into Naconiche Bayou (tributary to Attoyac Bayou and thus through Angelina River to the Neches).

TENMILE CREEK.—Dallas and Ellis counties; rises about 2 miles north of Cedar Hill; flows southeasterly 35 miles into Trinity River in the northeastern part of Ellis County. Dallas topographic map.

TENMILE CREEK.—Fannin County; rises in southeastern part of county; flows southerly 4 miles into North Sulphur River (tributary to Sulphur River, thence through Red River to the Mississippi).

TENMILE CREEK.—Jasper and Orange counties; rises about 3 miles southeast of Evadale in southwestern part of Jasper County; flows southwesterly 6 miles into Neches River in northwestern part of Orange County.

TENMILE CREEK.—Tom Green County; northeast of the City of San Angelo; an intermittent stream flowing 8 miles through the northeastern part of the county into Concho River (tributary to the Colorado). Hayrick topographic map.

TENMILE DRAW.—Sutton County; a small stream flowing through the southeastern part of the county to its junction with North Llano and thus through the Llano into Colorado River; length, 9 miles. Rock Springs topographic map.

TENNEY CREEK.—Caldwell County; rises two miles north of McMalan; flows southwesterly 9 miles into Plum Creek (tributary to San Marcos River and thus to the Guadalupe) 2 miles southwest of Tilmon. San Marcos topographic map.

TEQUESQUITE CREEK.—Kinney and Maverick counties; rises 5 miles south of Newel; flows southwesterly 15 miles into Rio Grande near Quemado.

TERLINGUA CREEK.—Brewster County; small stream rising in the southwestern part of the county and flowing southerly 50 miles into Rio Grande 2 miles south of Terlingua Abaja. Terlingua and Chisos mountains topographic maps.

TENTH CAVALRY CREEK.—Wichita County; rises 7½ miles northeast of Electra near Sunshine School; flows northerly about 7 miles, where it probably sinks into the sands; tributary through Red River to the Mississippi; intermittent. Barwise School and Clara topographic maps.

TERRETT DRAW.—Schleicher and Sutton counties; rises in the northwestern part of Sutton County; an intermittent stream flowing into San Saba River (tributary to the Colorado) a mile west of Fort McKavett in the southeastern part of Schleicher County; length, 17 miles. Fort McKavett topographic map.

TEXAS CREEK.—Cass County; rises near the Texas-Arkansas boundary line 1 mile northeast of Bloomburg; flows northerly 3½ miles into Little Cypress Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about one-half mile southeast of Cass. Atlanta topographic map.

THE BAYOU.—Waller County; rises north of Howth in the northwestern part of the county; flows westerly 6 miles into Brazos River. Howth topographic map.

THE LONG DRAW.—Brewster County; rises 4 miles north of Terlingua; flows southeasterly 12 miles into Terlingua Creek (tributary to Rio Grande) 4 miles north of Terlingua Abaja in southern part of county; intermittent. Terlingua topographic map.

THEISS GULLY.—Harris County; rises in northwestern part of county 2½ miles northeast of Louetta; flows southeasterly 3½ miles into Spring Gully and thus to Cypress and Spring creeks; intermittent. Louetta topographic map.

THIRD CREEK.—Lipscomb County; a stream 6 miles long flowing southerly into Wolf Creek (tributary through North Fork of Canadian River to the Canadian, and thus through Arkansas River to the Mississippi) 8 miles west of Lipscomb in western part of county; intermittent.

[illegible] 3 miles west of Alvord; flows southeasterly [illegible] Creek (tributary to East Fork of Trinity River [illegible] about 2 miles north of Clear Lake.

ERRA BLANCA CREEK.—Curry County, N. Mex., and Deaf Smith and Randall counties, Tex.; rises in northern part of Curry County, N. Mex., takes an easterly course 75 miles and flows into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) about 4 miles northeast of Canyon in western part of Randall County; dry channel, carrying food waters at rare intervals; course and origin not definite.

IGER CREEK.—Burnet County; flows into Colorado River 2 miles southwest of the town of Marble Falls; length, 4 miles. Burnet topographic maps.

IGER CREEK.—Jasper County; small stream flowing into Baer Creek (tributary to Angelina River, and thus to the Neches) in the northern part of the county.

IGER CREEK.—Mason and McCulloch counties; a stream flowing through the southeastern part of McCulloch and the northeastern part of Mason County into San Saba River east of Camp San Saba; length, 11 miles. Brady and Mason topographic maps.

TIGER CREEK.—San Augustine and Sabine counties; rises about 5 miles southeast of San Augustine in northern part of San Augustine County; flows southeasterly 7 miles into Palo Gaucho Bayou (tributary to Sabine River) in northwestern part of Sabine County.

TIMBER OR CROSS TIMBER CREEK.—Cooke and Grayson counties; rises about 2 miles southwest of Callisburg in Cooke County; flows southeasterly 14 miles into Jordan Creek (tributary through Isle du Bois Creek to Elm Fork of the Trinity, thence to Trinity River) about 2 miles southwest of Collinsville in Grayson County. Gainesville and Denison topographic maps.

TIMBER CREEK.—Fannin County; rises 3 miles northwest of Bonham in western part of county; flows northeasterly 9 miles into Bois d'Arc Creek (tributary to Red River and thus to the Mississippi) 5½ miles north of Dodd City.

TIMBER CREEK.—Hunt County; small stream flowing into Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of the Sabine) in the east central part of the county.

TIMBER CREEK.—Roberts County; rises near western line of county in southwestern corner; flows northerly 14 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 3 miles north of Peaceville.

TIMMONS CREEK.—Panola County; small stream flowing into Tuttle Creek (tributary to Jackson Creek and thus to the Sabine) in the northwestern part of the county.

TINSLEY CREEK.—Gonzales County; a small intermittent stream; rises in northeastern part of county; flows into Denton Creek (tributary to Peach Creek and thus to Guadalupe River) southwest of Possumtrot. Flatonia topographic map.

TODOS SANTOS CREEK.—Frio County; rises in the southwestern part of the county; flows easterly 11 miles into Leona River (tributary through Frio River to Nueces River) west of Derby.

TOLLETT CREEK.—Lamar County; rises about 4½ miles southeast of Petty in southwestern part of county near western boundary of county; flows southeasterly 6 miles into Bourland Creek (tributary to North Sulphur River, thence to Sulphur River and thus through Red River to the Mississippi).

TOM CREEK.—Comal County; near Cranes Mill in central part of county; small intermittent stream flowing into Guadalupe River.

TOM BALL CREEK.—Motley County; rises in western part of county; flows northeastward 21 miles into Pease River (tributary to Red River and thus to the Mississippi) in northern part of county.

THIRD OR WEST YEGUA CREEK.—Lee and Bastrop counties; rises about 4 miles east of McDade in northern part of Bastrop County; flows easterly 23 miles into Second Yegua Creek (tributary through Yegua Creek to Brazos River) about 2 miles north of Deobau in central part of Lee County. Bastrop topographic map.

THOMAS CREEK.—Bandera County; small tributary to Williams Creek (thence to the Nueces through Hondo and Frio rivers) in the southern part of the county; flows southwesterly 3 miles.

THOMAS LAKE.—Cass County; about 2 miles north of Bryans Mill; length, approximately 5 miles; formerly a channel of Sulphur River (tributary to Red River, which discharges into the Mississippi).

THOMPSON BRANCH.—Jones County; an intermittent stream rising near Skinout Mountain in western part of county and flowing northeasterly 15 miles into California Creek (tributary through Clear Fork of Brazos River to the Brazos) 2 miles southwest of Lenoir. Anson topographic map.

THOMPSON BRANCH.—Parker County; a small stream joining Willow Creek (tributary to South Fork of Trinity River, and thus through Clear Fork of Trinity River and West Fork of the Trinity to Trinity River) about 4 miles north of the town of Weatherford. Weatherford topographic map.

THOMPSON CREEK.—Bowie County; rises about 1 mile southeast of Corley; flows southeasterly 4 miles, passes through Big and Malden Lakes to Sulphur River, which discharges into the Mississippi through Red River; intermittent. New Boston topographic map.

THOMSON CREEK.—Gonzales County; rises near Possumtrot; small intermittent tributary to Sandy Fork of Peach Creek, thence to Peach Creek and Guadalupe River. Flatonia topographic map.

THOMPSONS CREEK.—Brazos County; rises in western part of county; flows southerly 10 miles into Brazos River 7 miles south of Bryan.

THORNSON CREEK.—Jack and Wise counties; small stream flowing into Gentry Creek (tributary to West Fork of Trinity River and thus to the Trinity) in the southeastern part of Jack and southwestern part of Wise County.

THORNTON OR RUSTLERS CREEK.—Hall and Childress counties; rises in eastern part of Hall County; flows northeasterly 10 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) in western part of Childress County.

THOUCHING CREEK.—Tyler and Hardin counties; rises about a mile east of Woodville in Tyler County; flows southerly 27 miles into Alabama Creek (tributary to Neches River) 6 miles northeast of Kountze in Hardin County.

THREADGILL CREEK.—Gillespie and Mason counties; [illegible] northeast of Harper in Gillespie County; flows northe[illegible] Beaver Creek, and thus to Llano River (tributary [illegible] Kerrville [illegible] Mason topographic maps.

THREEMILE CREEK.—Edwards County [illegible] part of county; unites with [illegible] 1½ miles above Ellis; [illegible] map.

THREEMILE CREEK.—Lam[illegible] 3½ mi[illegible] western boundary [illegible] of count[illegible] miles into Nort[illegible]tary [illegible] through Red [illegible] at [illegible] county.

TICKY CREEK.—[illegible] 13 miles [illegible]nity [illegible] and thu[illegible]

Tierra Blanca Creek.—Curry County, N. Mex., and Deaf Smith and Randall counties, Tex.; rises in northern part of Curry County, N. Mex., takes an easterly course 75 miles and flows into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) about 4 miles northeast of Canyon in western part of Randall County; dry channel, carrying food waters at rare intervals; course and origin not definite.

Tiger Creek.—Burnet County; flows into Colorado River 2 miles southwest of the town of Marble Falls; length, 4 miles. Burnet topographic maps.

Tiger Creek.—Jasper County; small stream flowing into Baer Creek (tributary to Angelina River, and thus to the Neches) in the northern part of the county.

Tiger Creek.—Mason and McCulloch counties; a stream flowing through the southeastern part of McCulloch and the northeastern part of Mason County into San Saba River east of Camp San Saba; length, 11 miles. Brady and Mason topographic maps.

Tiger Creek.—San Augustine and Sabine counties; rises about 5 miles southeast of San Augustine in northern part of San Augustine County; flows southeasterly 7 miles into Palo Gaucho Bayou (tributary to Sabine River) in northwestern part of Sabine County.

Timber or Cross Timber Creek.—Cooke and Grayson counties; rises about 2 miles southwest of Callisburg in Cooke County; flows southeasterly 14 miles into Jordan Creek (tributary through Isle du Bois Creek to Elm Fork of the Trinity, thence to Trinity River) about 2 miles southwest of Collinsville in Grayson County. Gainesville and Denison topographic maps.

Timber Creek.—Fannin County; rises 3 miles northwest of Bonham in western part of county; flows northeasterly 9 miles into Bois d'Arc Creek (tributary to Red River and thus to the Mississippi) 5½ miles north of Dodd City.

Timber Creek.—Hunt County; small stream flowing into Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of the Sabine) in the east central part of the county.

Timber Creek.—Roberts County; rises near western line of county in southwestern corner; flows northerly 14 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 3 miles north of [illegible]

Timmons Creek.—Panola County; small stream flowing into [illegible] (tributary to Jackson Creek and thus to the Sabine) in the [illegible] part of the county.

Tinsley Creek.—Gonzales County; a small intermittent [illegible] eastern pa[illegible]y; flows into Denton Creek [illegible] and thu[illegible]e River) southwest of [illegible] graphic [illegible]

To[illegible] Sa[illegible] ty; rises in the [illegible] erly 4 [illegible] into Leona River [illegible] ted River [illegible] f Derby. [illegible] ises about [illegible] r western [illegible] ng rising in north- [illegible] Creek [illegible] n Fork of Red River, [illegible] hus through [illegible] Crane [illegible] about 4 miles west of Rogan- [illegible] 20 miles; empties into Big Cow [illegible] h of Logtown in the south central [illegible] out 3 miles east of the center of county; [illegible] Neches River.

T[illegible] Creek.—Matagorda County; small stream in southwestern part of the county; flows westerly 2 miles into Tres Palacios Bay, and thence to Matagorda Bay and Gulf of Mexico, below Collegeport.

T[illegible] Creek.—[illegible] County; an intermittent stream rising in eastern part of Quay County, N. Mex., passing into Oldham County, Tex., near southwestern corner, and flowing northeasterly 30 miles into Canadian River (tributary to Arkansas River and thus to the Mississippi) 16 miles north of Adrian in western part of county.

T[illegible] Branch.—[illegible] County; rises 4 miles east of Naples; flows northerly 3 miles into White Oak Creek (tributary through Jennings Lake to Sulphur River and thus through Red River to the Mississippi). Daingerfield topographic map.

Tule Canyon Creek.—Briscoe County; rises in northern part; flows easterly 7 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi).

Tule Creek.—Castro, Swisher, and Briscoe counties; rises about one mile east of Arney in northeastern part of Castro County; flows easterly approximately [illegible] miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) in northwestern part of Briscoe County. Dry channel carrying only flood waters at rare intervals; its course and origin in upper reaches are definite.

Turkey Creek.—Atascosa County; rises about 5 miles south of Charlotte; flows southeasterly 15 miles into La Parita Creek (tributary to the Nueces through Atascosa and Frio rivers) near Christine.

Turkey Creek.—Atascosa County; rises in the southwestern part of the county; flows southerly 4 miles into [illegible] Creek (tributary to Nueces River through San Miguel and Frio rivers).

Turkey Creek.—Bandera and Uvalde counties; rises in southwestern part of Bandera County; flows southerly 3 miles to its junction with Sabinal River (tributary to the Nueces through Frio River) at Utopia in the northeastern part of Uvalde County.

Turkey Creek.—Bell and Coryell counties; rises 2 miles south of Ruth in southeastern part of Bell County; flows southeasterly 15 miles into Leon River (tributary through Little River to the Brazos) 2 miles northwest of Moffat. Temple and Gatesville topographic maps.

Turkey Creek.—Briscoe and Hall counties; rises in eastern part of Briscoe County; flows southeasterly 4 miles into Little Red River (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in the western part of Hall County.

Turkey Creek.—Briscoe and Armstrong counties; rises in northern part of Briscoe County; flows northerly about 2 miles into Prairie Dog Town Fork of Red River (tributary to Red River and thus to the Mississippi) about one-half mile north of the southern boundary of the county in southern part of county.

Turkey Creek.—Cass County; small intermittent stream flowing into Mill Creek (tributary to Flat Creek and thus through Black Cypress Bayou to Big Cypress Bayou thence through Caddo Lake to Red River and thus to the Mississippi), about 5 miles west of Linden in western part of county.

Turkey Creek.—Cass County; rises 3 miles east of Hughes Springs in southern part of county; flows southeasterly 4 miles into Hughes Creek (tributary through Black Cypress Bayou to Big Cypress Bayou, thence through Ferry and Caddo lakes to Red River and thus to the Mississippi) 3 miles north of Avinger.

TURKEY CREEK.—Clay County; rises about 11 miles northwest of Henrietta in north central part of the county; flows southeasterly 11 miles into Little Wichita River (tributary to Red River and thus to the Mississippi) about 6½ miles northeast of Henrietta.

TURKEY CREEK.—Donley County; rises about 4½ miles south of Jericho, in the northern part of county; flows southeasterly 10 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi), 7 miles northeast of Clarendon.

TURKEY CREEK.—Goliad County; rises in the northeastern part of county, flows 7 miles southeasterly into Perdido Creek (tributary to Coleto Creek and thus to Guadalupe River) near Germantown.

TURKEY OR MISTLETOE CREEK.—Goliad County; small stream in northeastern part of county; flows southeasterly 7 miles into Coleto Creek (tributary to Guadalupe River).

TURKEY CREEK.—Erath and Palo Pinto counties; rises north of Shelving Rock near Erath-Eastland County line; flows northerly 7 miles into South Palo Pinto Creek (tributary to Palo Pinto Creek and thus to Brazos River) 2 miles south of Mingus Lake in southwestern part of Palo Pinto County. Stephenville topographic map.

TURKEY CREEK.—Fort Bend County; rises in the southern part; flows southeasterly into Cow Creek and thus to Brazos River.

TURKEY CREEK.—Grimes County; rises in western part of county; flows southwesterly 5 miles from Erwin to its junction with Navasota River (tributary to Brazos River). Navasota topographic map.

TURKEY CREEK.—Harris County; rises 2½ miles southwest of Genoa; flows southeasterly and southwesterly 5 miles into Clear Creek (tributary to Clear Lake, Galveston Bay, and Gulf of Mexico); partially intermittent. Genoa topographic map.

TURKEY CREEK—Harris County; rises 5 miles northeast of Addicks near Katy Cut Off Road; flows southwesterly 5½ miles into Buffalo Bayou (tributary to Sabine, Trinity, and Galveston bays, and thus to Gulf of Mexico); intermittent. Hillendahl topographic map.

TURKEY CREEK.—Hall and Motley counties; rises in southwestern part of Hall County; flows southeasterly 14 miles into Pease River (tributary to Red River and thus to the Mississippi) about 5 miles southwest of Northfield in northern part of Motley County.

TURKEY CREEK.—Hopkins and Rains counties; rises in southwestern part of Hopkins County; flows southerly 10 miles into Lake Fork of Sabine River (tributary to the Sabine) in northeastern part of Rains County.

TURKEY CREEK.—Hunt County; rises near Wolfe City in northern part of county; flows southwesterly 4 miles into South Sulphur River (tributary to Sulphur River, thence through Red River to the Mississippi).

TURKEY CREEK.—Johnson County; rises 1 mile south of Marystown in the northern part of the county; flows southeasterly 11 miles to a point 4 miles southeast of Alvarado in eastern part of the county, where it enters North Fork of Pecan Creek, and thus through Pecan and Richland creeks to Trinty River. Cleburne topographic map.

TURKEY CREEK.—Kinney, Uvalde, and Zavalla counties; rises in the southeastern part of Kinney County; flows southeasterly 7 miles through Kinney County, 15 miles through the southwestern part of Uvalde County, then 32 miles southerly through the western part of Zavalla County into Elm Creek (tributary to the Nueces) near Crystal City. Brackett and Uvalde topographic maps.

TURKEY CREEK.—Montague County; small intermittent stream flowing into [illegible] Creek (tributary to Red River, which discharges into the Mississippi) in the northeastern part of county. Montague topographic map.

TURKEY CREEK.—Palo Pinto and Parker counties; rises two miles north of [illegible] in northwestern corner of Parker County; flows southwesterly 18 miles into Brazos River 3 miles west of Mineral Wells in northeastern corner of Palo Pinto County. Palo Pinto topographic map.

TURKEY CREEK.—Parker County; a small stream flowing into Clear Fork of Trinity River (tributary to West Fork of Trinity River and thus to the Trinity) [illegible] miles southwest of Aledo in southeastern part of county. [illegible] topographic map.

TURKEY CREEK.—Potter County; rises in northeastern corner of Potter County; flows [illegible] miles into Canadian River, thence to the Arkansas, which discharges into the Mississippi.

TURKEY CREEK.—Red River County; small stream about 4 miles southwest of [illegible] flowing into Ward Creek (tributary through Cuthand Creek to Sulphur River and thus through Red River to the Mississippi) in western part of county.

TURKEY CREEK.—San Augustine County; small stream flowing into Ayish Bayou (tributary to Angelina River and thus to the Neches) in central part of county.

TURKEY CREEK.—Tyler County; rises about 4 miles north of Woodville; flows [illegible] miles into Big Cypress Creek (tributary to Alabama Creek and thus to Neches River).

TURKEY CREEK.—Uvalde and Bandera counties; rises about 5 miles southeast of Vanderpool in western part of Bandera County; flows southerly 13 miles into Sabinal River (tributary to Frio River and thus to the Nueces) in northeastern part of Uvalde County.

TURKEY CREEK.—Wilbarger County; rises in south central part; flows southeasterly [illegible] miles into Beaver Creek (tributary to Wichita River and thus through Red River to the Mississippi).

TURKEY CREEK.—Williamson and Milam counties; rises north of Taylor; flows easterly [illegible] miles into Brushy Creek (tributary through San Gabriel River to Little River and thus to the Brazos) 4 miles northeast of Thorndale. Taylor topographic map.

TURKEY CREEK.—Wise County; a small stream flowing into Big Sandy Creek (tributary to West Fork of Trinity River and thus to the Trinity) west of the town of Decatur in central part of county.

TURKEY CREEK.—Wharton County; small intermittent tributary to Pin Oak Creek and thus to Gulf of Mexico through Sandy Creek, Navidad and Lavaca rivers, and Matagorda Bay, in the western part of the county.

TURKEY SPRING BRANCH.—Archer County; headwater stream of West Fork of Trinity River (tributary to the Trinity) in the southeastern part of the county.

TURTLE BAYOU.—Liberty and Chambers counties; rises in Liberty County in the southern part; flows southerly 6 miles through Liberty County, then 6 miles through Chambers County into Turtle Bay (thus to Trinity River, Galveston Bay, and Gulf of Mexico).

TURTLE CREEK.—Dallas County; small tributary to Trinity River northwest of Dallas. Dallas topographic map.

TURTLE CREEK.—Kerr County; rises in the central part of the county; flows easterly 30 miles into Guadalupe River 12 miles south of Kerrville.

TURTLE CREEK.—Matagorda County; rises in the western part of the county; flows southwesterly 6 miles into Turtle Bay, thence to Matagorda Bay and Gulf of Mexico.

TURTLE HOLE CREEK.—Motley County; rises in northeastern part of county; flows easterly 9 miles into Middle Pease River (tributary to Pease River and thus through Red River to the Mississippi).

TURNOVER CREEK.—Coryell County; small stream flowing northeasterly 7 miles into Leon River (tributary to Little River and thus to the Brazos) at Straws Mill in central part of county. Gatesville topographic map.

TUTTLE BRANCH.—Fayette County; southeast of Muldoon in the central part of county; a small intermittent tributary through Pinoak to Buckner Creek, and thus to Colorado River; length, 3 miles. Flatonia topographic map

TUTTLE CREEK—Panola County; northwestern part of county; flows southwesterly 3 miles to its junction with Rogers Creek (thence to Sabine River through Jackson Creek)

TWIN BRANCH.—Leon County; small stream flowing into Upper Keechi Creek (tributary to Trinity River) in northeastern part of the county.

TWIN CREEK.—Van Zandt and Henderson counties; rises in southwestern part of Van Zandt County; flows southwesterly into Cedar Creek (tributary to Trinity River) about 5 miles northwest of Phantom in northwestern part of Henderson County.

TWOMILE CREEK.—Edwards County; a small intermittent stream in southern part of the county; unites with West Nueces River (tributary to Nueces River) just below Ellis; flows easterly 6 miles. Nueces topogrpahic map.

UNION CREEK.—Victoria County; rises near Guadalupe in the central part of the county; flows eastward 12 miles into Lavaca Bay and thus to Matagorda Bay and Gulf of Mexico.

UPPER KEECHI CREEK.—Freestone and Leon counties; rises in central part of Freestone County; flows southeasterly 43 miles into Trinity River in northeastern part of Leon County about 9 miles southeast of Navarro.

UPSHUR CREEK.—Brazos County; the stream flows southeasterly 5 miles from the town of Millican into Navasota River (tributary to Brazos River); intermittent. Navasota topographic map.

VALE CREEK.—Wise County; rises 5 miles south of Boonsville; flows northeasterly 15 miles into West Fork of Trinity River (tributary to Trinity River) about 5 miles southeast of Paradise.

VALENTINE BRANCH.—Tom Green County; southwest of the town of Miles in the northeastern part of the county; an intermittent tributary to Concho River and thus to the Colorado; length, 11 miles. Hayrick topogrophic map.

VALLEY BRANCH.—Ellis and Hill counties; rises 2 miles south of Files Valley; flows northeasterly 6 miles into North Fork of Pecan Creek (tributary to Trinity River through Pecan Creek) in southwestern part of Ellis County. Cleburne topographic map.

VALLEY BRANCH.—Gonzales County; northwest of Nickel in northeastern part of county; small intermittent stream flowing into Peach Creek (tributary to Guadalupe River). Flatonia topographic map.

VALLEY BRANCH.—Johnson County; small stream flowing to Walnut Creek (tributary through Mountain Creek to West Fork of the Trinity River and thus to Trinity River) about 4 miles northwest of Pleasant Point. Fort Worth topographic map.

[illegible]—Montague and Cooke counties; rises about half a mile north [illegible] part of Montague County; flows northeasterly [illegible] tributary to the Mississippi) about 1 mile south of [illegible] northwestern part of Cooke County. Montague [illegible] topographic maps.

[illegible] Wichita counties; rises about 3 miles northeast of [illegible] part of [illegible] County; flows northeasterly 7 [illegible] tributary to Red River and thus to the Missis[illegible] part of Wichita County.

[illegible]—[illegible] County; rises in western part of county; [illegible] into Little Wichita River (tributary to Red [illegible] miles northeast of Henrietta.

[illegible] miles southwest of Marysville in [illegible] miles into Red River (tributary [illegible] northeast of Butcher. Gainesville topo[illegible].

[illegible] Runnels counties; rises 7 miles southeast of Dora [illegible] County; flows southerly 11 miles [illegible] through Runnels County into Colo[illegible] central part of Runnels [illegible] topographic maps.

[illegible] southeast of Pomeantrot; small inter[illegible] of the county; flows into Peach [illegible] topographic map.

[illegible] counties; rises 5 miles south[illegible] of Jeff Davis County; flows southerly [illegible] west of San Carlos. Chispa and San [illegible].

[illegible] southwestern part of county; flows [illegible] River at [illegible].

[illegible] small stream flowing into Bois d'Arc Creek [illegible] into the Mississippi) in the [illegible] of the county.

[illegible] intermittent stream in the western part [illegible] tributary to the Colorado) 4 miles east [illegible] map.

[illegible] small stream flowing into Ash Creek (tribu[illegible] to the Trinity) east of Veal [illegible] Weatherford and Fort [illegible].

[illegible] south of South Prairie; flows [illegible] tributary to Brazos River) 1 mile [illegible] of county. Breckenridge [illegible].

Venado Bayou.—San Augustine County; rises about 5 miles northwest of San Augustine; flows southeasterly 3 miles into Ayish Bayou (tributary to Angelina River and thence to Neches River) about 4 miles south of San Augustine.

Venow Creek.—Kerr County; rises in the southern part of the county; flows northeasterly 14 miles into Guadalupe River at Center Point.

Verde or Lucky Creek.—Bandera and Medina counties; rises in the southeastern part of Bandera County; flows southerly 3 miles through Bandera County, then 20 miles through Medina County into Hondo Creek (tributary [illegible] River through Frio River) near New Fountain.

VICTORIA CANYON.—Culberson County; an intermittent stream in western part of county; flows northeasterly 12 miles into Salt Lake 25 miles north of Van Horn. Van Horn topographic map.

VICTORIA CREEK.—Montague County; rises about 4 miles north of Bowie in western part of county; flows northerly 9 miles into East Belknap Creek (tributary to Belknap Creek and thus through Red River to the Mississippi) 4 miles west of Lucky. Montague topographic map.

VILLAGE CREEK.—Cass County; rises 2 miles south of Hughes Springs in southwestern part of county; flows easterly 4½ miles into Hughes Creek (tributary through Black Cypress and Big Cypress bayous to Ferry Lake, thence to Caddo Lake and thus through Red River to the Mississippi) 3 miles north of Avinger.

VILLAGE CREEK.—Ellis County; rises north of Ennis, in the eastern part of county; flows southeasterly 13 miles into Trinity River in the southeastern part of the county.

VILLAGE CREEK.—Harrison County; rises at Scottsville in eastern part of county; flows northeasterly 18 miles into Caddo Lake (tributary to Red River, and thus to the Mississippi) in the northeastern part of the county.

VILLAGE CREEK.—Montague County; rises about a mile west of Salmon School in northern part of county; flows northeasterly 8½ miles into Red River (tributary to Mississippi River) a mile northeast of Old Spanish Fort; intermittent. Montague topographic map.

VILLAGE CREEK.—Johnson and Tarrant counties; rises about one-half mile east of Joshua in the northern part of Johnson County; flows northeasterly 26 miles into West Fork of Trinity River (tributary to the Trinity) 3 miles northwest of Arlington in Tarrant County. Cleburne and Fort Worth topographic maps.

VILLAGE CREEK.—Van Zandt and Smith counties; rises in the eastern part of Van Zandt County; flows northeasterly 12 miles into Sabine River near Silver Lake near the northwestern corner of Smith County.

VILLAREAL CREEK.—Webb County; a small tributary to Prieto Creek (thence to Nueces River) in eastern part of county.

VINCE BAYOU.—Harris County; a tidal stream; rises in the southeastern part of the county; flows northerly 4 miles into Ship Channel (Buffalo Bayou) and thus to Galveston Bay and Gulf of Mexico 1 mile northwest of Pasadena; historically important as "San Jacinto Battlefield." Deepwater topographic map.

VINCE BAYOU, LITTLE.—Harris County; rises in the southeastern part of county; flows northwesterly 4 miles into Vince Bayou (tributary to Buffalo Bayou and thus to Gulf of Mexico) 1 mile northwest of Pasadena; intermittent. Deepwater topographic map.

VIOLET CREEK.—Kendall County; tributary to Guadalupe River in the central part of the county south of Sisterdale.

WADDELLS CREEK.—Crosby County; rises near Crosby-Dickens County line; flows southwesterly 4 miles into White River (tributary to Salt Fork of Brazos River and thus to the Brazos) in eastern part of county.

WAGON CREEK.—Armstrong County; southern part; flows southeastward 7 miles into Gypsum Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi).

WAGON CREEK.—Collingsworth County, Tex., and Beckham County, Okla.; rises in northeastern part of Collingsworth County, Tex.; flows northeastward 1½ miles to its intersection with Texas-Oklahoma boundary line, thence easterly into Elm Fork of Red River (tributary to North Fork of Red River and thus through Red River to the Mississippi).

WAGON TIMBER CREEK.—Young and Stephens counties; rises near Carbondale in southwestern part of Young County; flows southeasterly 5 miles into Clear Fork of Brazos River (tributary to Brazos River) in northern part of Stephens County. Breckenridge topographic map.

WAKEFIELD LAKE.—Gray County; a prairie lake in southwestern part of county; outlet, McClelland Creek (tributary to North Fork of Red River and thus through the Red to Mississippi River); area about 1 square mile.

WALKERS BRANCH.—Tarrant County; small tributary to West Fork of Trinity River (which discharges into the Trinity) south of Smithfield. Fort Worth topographic map.

WALKERS BRANCH.—Ellis County; small stream flowing into Village Creek and thus to Trinity River in southeastern part of county.

WALKER CREEK.—Camp County; rises about 3 miles southwest of Pittsburg; flows northeastward 8 miles to Big Cypress Creek, thence to Caddo Lake and thus through the Red to Mississippi River.

WALKER CREEK.—Comanche and Erath counties; rises near Mount Airy in southwestern part of Erath County; flows southwesterly 5 miles into Leon River (tributary to Little River and thus to the Brazos) 3½ miles southeast of De Leon in northern part of Comanche County. Stephenville topographic map.

WALKER CREEK.—Grimes County; a southerly flowing stream 6 miles long joining Smith Creek and thus through Ben Fort Creek to Navasota River, thence to the Brazos.

WALKER CREEK.—Grimes County; rises east of Wood in southern part of county; flows southwesterly into Brazos River 1½ miles northwest of Courtney. Navasota topographic map.

WALKER CREEK.—Presidio County; an intermittent stream 16 miles long rising in Tierra Vieja Mountains 5 miles southeast of San Carlos and flowing southerly into Capote Creek (tributary to Rio Grande) 4 miles northeast of San Antonio, Mexico. San Carlos topographic map.

WALKER CREEK.—Roberts County; a small intermittent stream 6 miles long flowing southerly into Canadian River (tributary through Arkansas River to the Mississippi) 5 miles northeast of Peaceville in northwestern part of county.

WALLACE BRANCH.—Blanco County; rises in the northeastern part of the county; flows into Cypress Creek, and thus through Pedernales River into the Colorado; length, 3 miles. Blanco topographic map.

WALLACE BRANCH.—Johnson County; a southerly flowing stream 4 miles in length uniting with Nolands River (tributary to the Brazos) 3 miles southeast of Munroe in western part of county. Cleburne topographic map.

WALLACE CREEK.—San Saba County; a stream 15 miles long joining the San Saba (tributary to Colorado River) 4½ miles west of the town of San Saba in the eastern part of the county. San Saba topographic map.

WALLER CREEK.—Cooke County; small intermittent stream flowing into Elm Fork of Trinity River (tributary to the Trinity) west of Muenster in the southwestern part of the county. Gainesville topographic map.

WALLER CREEK.—Travis County; rises north of the city of Austin in the central part of the county; flows southerly 5 miles, passes through the city of Austin into Colorado River one-fourth mile below Congress Avenue viaduct. Austin topographic map.

WALLEYE CREEK.—Milam and Lee counties; rises in southern part of Milam County; flows southerly into Cross Creek (tributary through Second Yegua Creek to Yegua Creek and thus to the Brazos) 1 mile east of Florence; partially intermittent. Bastrop topographic map.

WALOOPE CREEK.—Concho and McCulloch counties; small stream in northwestern part of McCulloch and northeastern part of Concho County; flows through Salt Creek into Colorado River; length, 7 miles. Eden topographic map.

WALNUT CREEK.—Anderson County; rises in the northern part of the county; flows southeasterly 20 miles into Neches River near the International & Great Northern Railway crossing in eastern part of the county.

WALNUT CREEK.—Austin County; rises 2 miles northwest of New Ulm; flows easterly 8 miles into West Fork of Mill Creek (tributary through Mill Creek to Brazos River) 6 miles northeast of New Ulm, in western part of county.

WALNUT CREEK.—Comanche and Erath counties; rises 2 miles southwest of Dublin, in southern part of Erath County; flows southwestward 11 miles into Leon River (which discharges into the Brazos through Little River) 2 miles southwest of Camden. Stephenville and Hamilton topographic maps.

WALNUT CREEK.—Caldwell and Bastrop counties; rises in the northern part of Caldwell County near Lytton Springs; flows easterly 9 miles through Caldwell County, then 19 miles through Bastrop County into Colorado River 1½ miles northwest of Upton. San Marcos, Bastrop, and Flatonia topographic maps.

WALNUT CREEK.—Camp County; rises in northwestern part of county; flows northeasterly 4 miles into Big Cypress Creek, thence to Caddo Lake and thus through Red River to the Mississippi.

WALNUT CREEK.—Donley County; rises in northeastern part of county; flows southeasterly 5 miles into Whitefish Creek (tributary to Salt Fork of Red River and thus through Prairie Dog Town Fork of the Red and Red rivers to the Mississippi).

WALNUT CREEK.—Falls County; an eastward flowing stream 9 miles long joining Brazos River in central part of county east of Lott.

WALNUT CREEK.—Gillespie County; small stream west of Cherry Spring, in northern part of county; flows northward 6 miles into Beaver Creek (tributary through Llano River to the Colorado). Kerrville topographic map.

WALNUT CREEK.—Grayson County; rises at Red Branch, in northwestern part of county; flows easterly 5 miles into Mineral Creek (tributary to Red River and thus to the Mississippi) about a mile south of Cedar Mills. Denison topographic map.

WALNUT CREEK.— Grimes, Waller, and Montgomery counties; rises in southeastern part of Grimes County; flows southeasterly 4 miles through Grimes, 8 miles through Waller, then 8 miles through Montgomery County into Spring Creek (tributary to West San Jacinto River, San Jacinto River, and Gulf of Mexico).

WALNUT CREEK.—Hood County; small stream flowing southerly 7 miles into Brazos River, 2 miles south of Acton, in northeastern part of county. Granbury topographic map.

WALNUT CREEK OR ROSE BAYOU.—Houston County; flows northeasterly 14 miles into Neches River in the eastern part of the county.

WALNUT CREEK.—Jasper County; rises about 2 miles east of Jasper; flows southwesterly 16 miles into Neches River.

WALNUT CREEK.—Johnson, Tarrant, and Dallas counties; rises about 3 miles northwest of Alvarado, in Johnson County; flows northeasterly 24 miles into Mountain Creek (which discharges into Trinity River through West Fork of the Trinity) 4 miles northwest of Cedar Hill, in Dallas County. Cleburne, Fort Worth, and Dallas topographic maps.

WALNUT CREEK.—Kaufman County; joins Ferris Fork of Cedar Creek (tributary to Cedar Creek and Trinity River) in southeastern part of county.

WALNUT CREEK.—Llano and Blanco counties; rises in the northern part of Blanco County; flows northward 11 miles into Sandy Creek (tributary to the Colorado) 1½ miles south of Sandy Mountain, Llano County. Burnet and Blanco topographic maps.

WALNUT CREEK.—Motley County; rises about 4½ miles east of Lyman, in southwestern part of county; flows southeastward 13 miles to its confluence with Oliver Fork of South Pease River to form South Pease River (tributary through Middle Pease River to Pease River and thus through the Red to Mississippi River) about 4 miles southeast of Roaring Springs; headwater stream of South Pease River.

WALNUT CREEK.—Orange County; small stream joining Neches River in the northwestern part of the county southeast of Fletcher.

WALNUT CREEK.—Palo Pinto County; a stream 4 miles long flowing southeasterly into Middle Creek (tributary to Palo Pinto Creek and thus to Brazos River) in southern part of county 2 miles northeast of Strawn. Palo Pinto topographic map.

WALNUT CREEK.—Roberts County; rises in southwestern part of county; flows northerly 19 miles to Canadian River (tributary to Arkansas River and thus to the Mississippi) 7 miles northeast of Peaceville, in northwestern part of county.

WALNUT CREEK.—Robertson County; rises in northern part of county; flows southwestward 15 miles into Little Brazos (tributary to Brazos River) 3 miles northwest of Calvert.

WALNUT CREEK.—Sabine County; rises in southern part of county; small headwater tream of Sixmile Creek (tributary to Sabine River).

WALNUT CREEK.—Travis County; rises just south of Merrilltown in the northern part of the county; flows southerly 14 miles into Colorado River, 2 miles southeast of Fort Prairie in the central part of the county. Austin topographic map.

WALNUT CREEK.—Upshur County; rises about 4 miles south of Coffeeville in eastern part of county; flows southerly 9 miles into Little Cypress Creek (tributary through Caddo Lake to Red River and thus to the Mississippi) near Jameson.

WALNUT CREEK.—Waller County; small stream rising 5 miles west of Howth in the northwestern part of the county and flowing southerly 5 miles into Brazos River, 4 miles west of Hempstead. Howth topographic map.

WALNUT CREEK.—Wise County; a small tributary to West Fork of Trinity River (which discharges into the Trinity) in the southeastern part of the county.

WALNUT CREEK.—Washington County; rises 3 miles northwest of Burton; flows southeasterly 9 miles into East Fork of Mill Creek (tributary to Mill Creek and thus to the Brazos) 7 miles west of Brenham in western part of county.

WALNUT CREEK.—Wise, Parker, and Tarrant counties; rises at Agnes in the northern part of Parker County; flows easterly 20 miles into West Fork of Trinity River (tributary to the Trinity) about 3 miles east of Azle in Tarrant County. Weatherford and Fort Worth topographic maps.

WANDERER CREEK.—Hardeman and Wilbarger counties; rises about 6 miles southwest of Quanah in the central part of Hardeman County; flows northeasterly 31 miles into Prairie Dog Town Fork of Red River (tributary to Red River, which discharges into the Mississippi) in northwestern part of Wilbarger County.

Ward Spring Branch.—Bowie County; about 5 miles southeast of New Boston; small tributary to Rock Creek (which discharges through Langum Creek into Sulphur River and thus through Red River to the Mississippi).

Ward or Wagner Creek.—Bowie County; rises about 7 miles northwest of Texarkana; flows southeasterly 8 miles to its junction with Harris Creek about 1½ miles south of Texarkana to form Hurricane Creek (tributary to Sulphur River and thus through Red River to the Mississippi) in the eastern part of the county. Texarkana topographic map.

Ward Creek.—Bowie County; rises about 5 miles south of DeKalb; flows southwesterly 7 miles into Ross Creek (tributary through Bassett Creek to Sulphur River and thus through Red River to the Mississippi) about 3½ miles northwest of Bassett in western part of counuty.

Ward Creek.—Hopkins County; small tributary to Garrett Creek (thence to Lake Fork of Sabine and Sabine rivers) in southwestern part of county.

Ward Creek.—Lamar and Red River counties; rises about a mile east of Blossom in the eastern part of Lamar County; flows southeasterly 16 miles into Cuthand Creek (tributary to Sulphur River and thus through Red River to the Mississippi) about 9½ miles southwest of Bagwell in western part of Red River County.

Wards Creek.—Medina County; flows southeasterly 6 miles to its junction with Hondo River (thence to Nueces River through Frio River) in the northern part of the county.

Warden Creek.—Anderson County; small stream 5 miles long flowing southeasterly into Ioni Creek (tributary to Neches River) in southeastern part of county.

Warley Lake.—Donley County; about a mile southeast of Lelia; an expansion of Lake Creek (tributary to Salt Fork of Red River, thence to Prairie Dog Town Fork of the Red River and thus through Red River to the Mississippi).

Warren Creek.—King County; a small stream rising in northeastern part of county and flowing into Polecat Creek (tributary through Farrers Creek to Middle Fork of Wichita River and thus through North Wichita River and Red River to the Mississippi).

Warring Creek.—Hamilton County; rises 5 miles northeast of Pottsville near Hamilton-Comanche county line; flows northeasterly 14 miles into Leon River (tributary to Little River and thus to the Brazos) 3½ miles northeast of Gentry Mill. Hamilton topographic map.

Wash Branch.—Palo Pinto County; a small stream flowing easterly 2 miles into Brazos River at Red Bluff in eastern part of county. Palo Pinto topographic map.

Washita River.—Roberts and Hemphill counties; rises near Miami in southeastern part of Roberts County; flows easterly about 35 miles to its intersection of the Texas-Oklahoma boundary line 5 miles southeast of Gem in southeastern part of Hemphill County; thence takes a southeasterly course to its junction with Red River (tributary to the Mississippi) in southern part of Oklahoma 10 miles northwest of Denison, Tex.

Washboard Canyon.—Brewster and Terrell counties; rises in southwestern part of Terrell County; flows southeasterly 12 miles, crossing Brewster-Terrell County line into San Francisco Creek (tributary to Rio Grande) near junction of Brewster-Terrell County line with Rio Grande; intermittent. Indian Wells topographic map.

Washboard Creek.—Mills and Hamilton counties; rises in northern part of Mills County; flows northeasterly 6 miles into Cowhouse Creek (tributary through Leon to Little River and thus to the Brazos) 3 miles northwest of Indian Gap. Brownwood and Hamilton topographic maps.

WASP CREEK.—Kendall County; rises near Welfare in central part of county; flows into Guadalupe River.

WATER OR SWEETWATER CREEK.—Gray and Wheeler counties, Tex., and Roger Mills and Beckham counties, Okla.; rises in northeastern corner of Gray County, Tex.; flows eastward 40 miles to its intersection with the Texas-Oklahoma boundary line on east boundary of Wheeler County, then southerly through Roger Mills and Beckham counties, Okla., into North Fork of Red River (tributary to Red River and thus to the Mississippi).

WATERS CREEK.—Llano County; an intermittent stream flowing into Llano River (tributary to the Colorado) 4 miles northwest of Packsaddle in the eastern part of the county; length, 5 miles. Llano topographic map.

WATERHOLE BRANCH.—Bastrop County; a small stream 4 miles in length in south central part of county; flowing through Sandy Creek into Walnut Creek thence to Colorado River. Flatonia topographic map.

WATERHOLE CREEK.—Colorado County; rises in the western part of the county; flows southwesterly 4 miles into Navidad River (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico).

WATERHOLE CREEK.—Colorado County; rises 5 miles south of Weimar; flows southwestward 7 miles into Navidad River (tributary to Lavaca River thence to Matagorda Bay and Gulf of Mexico) near Colorado-Lavaca County line.

WATSONS CREEK.—Throckmorton County; small stream rising in northeast corner of county; flows southerly 2½ miles into Brazos River.

WATTO CREEK.—Sabine County; small stream flowing easterly 5 miles into Housing Bayou (tributary to Sabine River) in central part of county.

WATTS CREEK.—Coleman County; an intermittent stream north of Santa Anna in the eastern part of the county; flows into Jim Ned Creek (tributary through Pecan Bayou to the Colorado); length, 9 miles. Coleman topographic map.

WAXAHACHIE CREEK.—Ellis County; formed about 3 miles southeast of Waxahachie by the union of the North and South Forks of Waxahachie Creek; flows southeasterly 14 miles into Pecan Creek (tributary through Richland Creek to Trinity River) near its intersection with the south line of county.

WAXAHACHIE CREEK, NORTH FORK OF.—Ellis County; rises in the northwestern part of the county; flows southeasterly 15 miles to its junction with the South Fork of Waxahachie Creek forming Waxahachie Creek (tributary to Pecan and Richland creeks, thence to Trinity River) 3 miles southeast of the town of Waxahachie.

WAXAHACHIE CREEK, SOUTH FORK OF.—Ellis County; rises in northwestern part of county; flows southeasterly 12 miles to its confluence with North Fork of Waxahachie Creek forming Waxahachie Creek (tributary to Pecan and Richland creeks; thence to the Trinity) about 3 miles southeast of the town of Waxahachie.

WEADINGTON CREEK.—Stonewall County; a stream 8 miles long flowing easterly into Croton Creek (tributary to Brazos River) 3 miles northwest of Kiowa Peak in northeastern part of county.

WEAKLEY BRANCH.—Ellis County; small stream flowing through southwestern part of county to a point east of Files Valley, where it enters North Fork of Pecan Creek (tributary to Pecan and Richland creeks and Trinity River). Cleburne topographic map.

WEBSTER CREEK.—Cass County; rises about 1½ miles southeast of Douglasville in northern part of county; flows northeasterly 4 miles into Shoal Creek (tributary to Sulphur River, which discharges into the Mississippi through Red River). Linden topographic map.

WEIRS CREEK.—Montgomery County; a small tributary to West San Jacinto River (thence to Gulf of Mexico through San Jacinto River and Galveston Bay) in the northern part of the county; flows southwesterly 5 miles.

WELCHS BAYOU.—Falls and Robertson counties; rises 2 miles northwest of Reagan in eastern part of Falls County; flows southerly 14 miles into Brazos River 4½ miles west of Hammond in western part of Robertson County.

WELCH CREEK.—Concho County; an intermittent stream 3 miles long in the western part of the county; flows into Kickapoo Creek (tributary to Concho River and thus to the Colorado). San Angelo topographic map.

WELLS CREEK.—Anderson County; rises about 2 miles north of Palestine; flows northeasterly 7 miles into Hurricane Creek, thence to Neches River.

WEST ALAMOSA CREEK.—Oldham County; an intermittent stream rising 13 miles southwest of Cheyenne and flowing northerly 7 miles to a point 6 miles southwest of Cheyenne where it unites with Middle Alamosa Creek (tributary through Canadian River to the Arkansas and thus to the Mississippi) in northwestern part of county.

WEST BELKNAP CREEK.—Clay and Montague counties; rises southeast of Bellevue in southeastern part of Clay County; flows northeasterly 12 miles to its confluence with Middle Belknap Creek to form Belknap Creek (tributary to Red River and thus to the Mississippi) 4 miles northwest of Stoneburg, in the western part of Montague County. Montague topographic map.

WEST BERNARD RIVER.—Wharton County; rises in the northeastern part of the county; flows southeasterly 19 miles into San Bernard River and thus to Gulf of Mexico.

WEST BITTER CREEK.—Donley and Hall counties; rises in southern part of Donley County; flows southeasterly 4 miles into Bitter Creek (tributary to Mulberry Creek, thence to Prairie Dog Town Fork of Red River and thus through the Red to Mississippi River) in northwestern part of Hall County.

WEST BROOK CREEK.—Fayette County; northwest of Flatonia in southwestern part of the county; small intermittent stream flowing into Big Fivemile Creek (thence to Peach Creek and Guadalupe River). Flatonia topographic map.

WEST BRUSHY CREEK.—Delta County; rises about 4 miles east of Cooper; flows southeasterly 8 miles to its junction with East Brushy Creek forming Brushy Creek (tributary to South Sulphur River, thence through Sulphur River to Red River and thus to the Mississippi).

WEST BUFFALO CREEK.—Johnson County; rises at Brushy Knob in central part of county; flows southerly 9 miles to its junction with East Buffalo Creek forming Buffalo Creek (tributary through Nolands River to the Brazos) 1 mile south of the town of Cleburne. Cleburne topographic map.

WEST BUFFALO CREEK.—Cottle County; rises in southeastern part of county; flows northward 6 miles into North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

WEST BULL CREEK.—Travis County; a small tributary through Bull Creek to Colorado River in the north central part of the county; length, 4 miles. Austin topographic map.

WEST CARANCAHUA CREEK.—Jackson County; a small stream in the eastern part of the county; flows southerly to its junction with Carancahua Creek (and thus to Matagorda Bay and Gulf of Mexico) about 2 miles north of Carancahua Bay.

West Copperas Creek.—Sutton and Kimble counties; a stream 5 miles long flowing through the northwestern part of Kimble County and eastern part of Sutton County to its junction with Copperas Creek and thus through North Llano River to Llano River (tributary to the Colorado). Fort McKavett topographic map.

West Farmers Creek.—Montague County; rises about 3 miles east of Montague in central part of county; flows northerly 8 miles into Farmers Creek (tributary to Red River and thus to the Mississippi) about 2 miles west of [illegible]. Montague topographic map.

West Kickapoo Creek.—[illegible] and Runnels counties; an intermittent stream in the northeastern part of [illegible] County and western part of Runnels County; flows 11 miles into Kickapoo Creek and then to the Colorado. Runnels topographic map.

West Little Postoak Creek.—Archer County; rises about 10 miles southeast of Archer City in eastern part of county; flows northeastward 10 miles to its junction with East Little Postoak Creek (tributary to Postoak Creek, Little Wichita River, and thus through Red River to the Mississippi) 11 miles northeast of Archer City.

West Noland Creek.—Johnson County; rises 2½ miles southwest of Bruce in western part of county; flows southeasterly 6 miles to its junction with Middle Noland Creek to form Nolands River (tributary to Brazos River) 2 miles southeast of [illegible]. Granbury and Cleburne topographic maps.

West Prong.—Lavaca County; rises southwest of Moulton; flows northeasterly and southeasterly 6 miles to its junction with Lavaca River (thence to Gulf of Mexico through Matagorda Bay) about 2½ miles southeast of Moulton. Flatonia topographic map.

West Salt or [illegible] Creek.—Collingsworth, Hall, and Childress counties; rises in southwestern part of Collingsworth County; flows southeasterly 16 miles into Salt Creek (tributary to Prairie Dog Town Fork of Red River and thus through Red River to the Mississippi) in northern part of Childress County.

West San Jacinto River.—Walker, Montgomery, and Harris counties; rises in southwestern part of Walker County; flows southeasterly about 70 miles through Harris and Montgomery counties to its junction with East San Jacinto River, in the northeastern corner of Harris County, to form San Jacinto River, tributary to Galveston Bay and thus to Gulf of Mexico.

West Sandy Creek.—Walker County; small tributary to West San Jacinto River (tributary to San Jacinto River and Gulf of Mexico) in the southwestern part of the county; flows southeasterly.

West State Line Creek.—Cass County; rises about 2 miles southeast of Queen City in northeastern part of county; flows southeasterly 8 miles into State Line Creek (tributary to Caddo Lake and thus through Red River to the Mississippi) near the Texas-Arkansas boundary line, about one-half mile southwest of Ravana, Ark.

West Valley Branch.—Montague County; small intermittent stream; unites with Valley Branch (tributary to Red and Mississippi rivers) in extreme northeastern part of county. Montague topographic map.

Wheat Creek.—Bell County; small stream flowing into Little River (tributary to the Brazos) in southern part of county north of Holland; length, 9 miles. Taylor topographic map.

Wheat Creek.—Cooke County; an intermittent tributary to Clear Creek (which discharges into Elm Fork of Trinity River, thence to the Trinity) southwest of Hood. Gainesville topographic map.

WHEELER CREEK.—Cooke County; joins Pecan Creek (which discharges into Trinity River through the Elm Fork of the Trinity) east of the town of Gainesville. Gainesville topographic map.

WHEELOCK CREEK.—Leon County; small stream, 6 miles long, rising in northeastern part of county and flowing northeasterly into Buffalo Creek, thence to Upper Keechi Creek and Trinity River.

WHITE CREEK.—Lampasas County; rises near Coryell-Lampasas county line; flows southwesterly 4½ miles into Lampasas River (tributary through Little River to the Brazos) 2 miles northwest of Townsen Mills. Lampasas topographic map.

WHITE CANYON.—Fisher County; small intermittent branch of Double Mountain Fork of Brazos River rising 8 miles northwest of Fisher and flowing northeasterly 5 miles. Roby topographic map.

WHITE CREEK.—Llano County; tributary through Sandy Creek to Colorado River in the southeastern part of the county; length, 10 miles. Fredericksburg, Llano, and Burnet topographic maps.

WHITES BAYOU.—Chambers County; a small tidal stream in the northern part of county; flows southwesterly 3 miles into Turtle Bay and thus through Trinity to Galveston Bay and Gulf of Mexico.

WHITES CREEK.—Brazos County; small southerly flowing stream 3 miles long joining Brazos River west of Welburn.

WHITE ROCK CREEK.—Collin and Dallas counties; rises about 3 miles northeast of Frisco in Collin County; flows southerly 33 miles into Trinity River 1 mile west of Miller. Dallas topographic map.

WHITE OR BLANCO FORK OF BRAZOS RIVER.—Kent, Garza, Crosby, Floyd, Hale, and Castro counties; rises south of Dimmitt in south central part of Castro County; flows southeasterly 130 miles into Salt Fork of Brazos River (tributary to the Brazos) in northwestern part of Kent County, principal tributary to Salt Fork of Brazos River.

WHITE BLUFF CREEK.—Somervell County; an intermittent stream rising 3 miles northeast of Chalk Mountain and flowing northerly 5 miles into Paluxy Creek (tributary to Brazos River) 4 miles west of Glenrose in western part of county. Granbury topographic map.

WHITE DEER CREEK.—Hutchinson and Carson counties; rises 8 miles north of White Deer in northeastern part of Carson County; flows northerly into Canadian River (tributary to Arkansas River and thus to the Mississippi) 10 miles northeast of Plemons in eastern part of Hutchinson County; length, 24 miles.

WHITE FISH CREEK.—Gray and Donley counties; rises in southern part of Gray County; flows southeasterly 22 miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi) in eastern part of Donley County.

WHITEOAK BAYOU.—Harris County; rises near Fairbanks in northwestern part of the county; flows southeasterly 21 miles into Buffalo Bayou (thence to Galveston Bay and Gulf of Mexico) in the City of Houston. Satsuma, Hillendahl, Aldine, and Houston Heights topographic maps.

WHITEOAK CREEK OR BAYOU.—Hopkins, Franklin, Titus, and Morris counties; rises in central part of Hopkins County near Sulphur Springs; flows easterly through northern part of Franklin, Titus, and Morris counties into Sulphur River (tributary to Red River, which discharges into the Mississippi) 5 miles north of Naples in northeastern part of Morris County; length, 65 miles.

[illegible] Creek.—Red River County: rises [illegible] of [illegible] in [illegible] miles into Kickapoo Creek [illegible] Creek and [illegible] through Sulphur and Red rivers [illegible]

[illegible] Creek.—[illegible] County: rises about [illegible] then [illegible] Trinity River [illegible] miles southeast of the town of [illegible] 22 miles.

[illegible] Creek.—Hill County: small tributary to Pecan Creek (which discharges into Trinity River through Richland Creek) in eastern part of county. Corsicana topographic map.

White Rock Creek.—Hill County: rises 4 miles southeast of Whitney in [illegible] part of county; flows southerly 6 miles into Brazos River. Waco topographic map.

White Rock Creek.—McLennan County: rises about 4 miles north of Ross; flows southerly 12 miles into Brazos River 3½ miles north of Waco near central part of county. Waco topographic map.

Whitesmith Creek.—Motley County: a small stream flowing through northwestern part of county to Quitaque Creek (tributary to Pease River, which discharges into the Mississippi through Red River).

Wichita or Big Wichita River.—Baylor, Archer, Wichita, and Clay counties; formed northwest of Seymour in northwestern part of Baylor County by union of North and South Wichita rivers; flows northeastward about 90 miles into Red River (tributary to the Mississippi) about 3 miles northwest of Byers in northern part of Clay County. Fowlkes, Iowa Park, and West Wichita Falls topographic maps.

Wicksons Creek.—Brazos County; rises near Tabor in northwestern part of county; flows southeasterly 10 miles into Brushy Creek (tributary through Navasota River to the Brazos).

Wiesache (Huisache) Creek.—Jackson and Calhoun counties; rises in the southeastern part of Jackson County; flows southerly and southeasterly 11 miles through Jackson County, then 5 miles through Calhoun County into Cow Bay, thence to Lavaca Bay and Gulf of Mexico.

Wilbarger Creek.—San Saba County; a partially intermittent stream rising 3½ miles northeast of Cowboy in the northeastern part of the county and flowing 14 miles into Colorado River. Brady and San Saba topographic maps.

Wilbarger Creek.—Travis and Bastrop counties; rises in the eastern part of Travis County; flows southeasterly 14 miles through Travis County, then 14 miles through Bastrop County into Colorado River 6 miles northwest of Bastrop in the central part of Bastrop County. Austin and Bastrop topographic maps.

Wilburn Branch.—Cooke County; small stream flowing about a mile west of Marysville in northern part of county and entering South Fish Creek (tributary to Fish Creek, thence to Red and Mississippi rivers). Gainesville topographic map.

Wild Cat Creek.—Cooke County; small intermittent stream flowing into Elm Fork of Trinity River (tributary to the Trinity) about 3 miles southwest of Myra. Gainesville topographic map.

Wild Cat Creek.—Coleman County; a stream 4 miles long; flows to the southwest of the town of Coleman in the central part of the county; joins Colorado River through Home Creek. Coleman topographic map.

Wild Cat Creek.—Hall County; a stream 4 miles long rising in western part of county and flowing southeasterly into Little Red River (tributary through Prairie Dog Town Fork of Red River to the Red and thus to the Mississippi).

Wild Cat Creek.—Henderson and Anderson counties; rises in southwestern part of Henderson County; flows southwesterly 11 miles into Trinity River near northwestern corner of Anderson County.

Wild Cat Creek.—Wilbarger County; rises in northwestern part of county; flows southerly 7 miles into Pease River (tributary to Red River and thus to the Mississippi) about 2 miles northwest of Vernon.

Wild Cat Creek.—Red River County; rises about 3 miles northwest of Detroit near Lamar-Red River county line; flows southeasterly 10 miles into Ward Creek (tributary to Cuthand Creek and thus through Sulphur and Red rivers to the Mississippi) in western part of county.

Wild Horse Creek.—Jeff Davis and Culberson counties; rises 3 miles southwest of Chispa in eastern part of Jeff Davis County; flows northerly 40 miles to a point in southern part of Culberson County 10 miles north of Wild Horse, where it sinks in sands; intermittent. Chispa and Van Horn topographic maps.

Wild Horse Creek.—Wichita County; rises in northern part of county 1¾ miles southwest of Clara; flows northeastward 6 miles into Red River (tributary to Mississippi). Clara topographic map.

W[illegible] Creek.—[illegible] County; rises near W[illegible]; flows northerly 10 miles [illegible] tributary to Canadian River and thus [illegible] Mississippi near Oldham-Potter county line.

W[illegible] Creek.—[illegible] County; rises about 5 miles east of Gary; flows [illegible] into [illegible] River about 5 miles southwest of Logan.

[illegible] Creek.—[illegible] County; rises 4 miles northwest of Lanark; flows northwesterly 3 miles into [illegible] River (tributary to Red River, which discharges into the Mississippi). [illegible] topographic map.

W[illegible] Creek.—[illegible] and [illegible] counties; rises about one-half mile [illegible]; flows southeasterly 12 miles into Clear Creek (tributary to Elm Fork of Trinity River and thus to the Trinity) 7 miles [illegible] in the southwestern part of the county. Montague and [illegible] topographic maps.

W[illegible] Creek.—[illegible] County; rises in the northwestern part of county; flows southeasterly and easterly 1[illegible] miles into Salt Fork of Red River (tributary to Prairie Dog Town Fork of the Red and thus through Red River to the Mississippi) in the western part of county.

Williams Creek.—Bandera County; a small intermittent stream in southern part of the county; flows southeasterly 6 miles to its junction with Hondo River (thence to the Nueces through Frio River) near southern county line.

Williams Creek.—Cooke County; an intermittent stream flowing into Clear Creek (tributary to Elm Fork of Trinity River, then to Trinity River) in southwestern part of the county. Gainesville topographic map.

Williams Creek.—Fayette County; rises in southeastern part of county 4 miles south of La Grange; flows southeastward to its junction with Colorado River; length, 8 miles.

Williams Creek.—Gillespie and Blanco counties; flows into Pedernales River (tributary to Colorado River) 2 miles southwest of Westbrook in the western part of Blanco County; length, 6 miles. Fredericksburg topographic map.

Williams Creek.—Jasper County; small stream flowing into Jordan Creek (tributary to Indian Creek, thence to Angelina and Neches rivers) in northwestern part of the county.

Williams Creek.—Jack County; small stream flowing into North Creek (tributary to West Fork of Trinity River and thus to the Trinity) northwest of Jacksboro in central part of the county.

Williams Gully.—Harris County; rises 4 miles southeast of Humble; flows southwesterly 4½ miles into Garner Bayou (thence to Greens Bayou, and thus through Buffalo Bayou to Gulf of Mexico); intermittent. Harmaston topographic map.

Williams Creek.—Lavaca and Dewitt counties; a small stream 3 miles long flowing southeastward along county line into Little Brushy Creek (which discharges into Lavaca River through Chicolete Creek and thus to Matagorda Bay and Gulf of Mexico).

Williamson Creek.—Travis County; rises 3 miles northwest of Oak Hill, in the southwestern part of the county; flows southeastward 14 miles into Onion Creek and thus to Colorado River, 4 miles southwest of Delvalle; intermittent. Austin topographic map.

Williamson Creek.—Williamson County; rises at Corn Hill; flows southeasterly 20 miles into San Gabriel River (tributary through Little River to the Brazos) 8 miles southeast of Granger. Taylor and Georgetown topographic maps.

WILLIES CREEK.—Howard, Borden, Scurry, and Mitchell counties; rises in northern part of Howard County; flows in a northeasterly and easterly direction 23 miles into Colorado River in the northwestern part of Mitchell County.

WILLIS CREEK.—Brown County; rises south of Brownwood in the southeastern part of the county; flows 7 miles into Pecan Bayou (tributary to the Colorado). Coleman and Brownwood topographic maps.

WILLOW BAYOU.—Galveston County; rises in the western part of the county; flows southwesterly 3 miles into Halls Bayou, thence to West Galveston Bay and Gulf of Mexico.

WILLOUGHBY BRANCH.—Mills County; rises in northwestern part of county, 2¼ miles northwest of Mullen; flows westerly 4 miles into Pompey Creek (tributary to Pecan Bayou and thus to Colorado River and Gulf of Mexico); partially intermittent. Brownwood topographic map.

WILLOW BRANCH.—Colorado County; rises in the northeastern part of the county; flows southeasterly 8 miles into San Barnard River (thence to Gulf of Mexico).

WILLOW BRANCH.—Lavaca County; in eastern part of county; flows southwesterly 5 miles into Navidad River (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico), 6 miles south of Sublime.

WILLOW BRANCH.—Tarrant County; small stream joining Walnut Creek (tributary through Mountain Creek to West Fork of Trinity River, and thus to the Trinity) west of the town of Mansfield. Fort Worth topographic map.

WILLOW CREEK.—Aransas County; rises in the northern part of the county; flows southward 3 miles into St. Charles Bay and thus to Aransas Bay and Gulf or Mexico.

WILLOW CREEK.—Bastrop County; small intermittent stream 7 miles in length flowing into Colorado River 3 miles northeast of Smithville in the southeastern part of the county. Bastrop and Flatonia topographic maps.

WILLOW CREEK.—Bosque County; rises 4 miles west of Merrivale in southern part of the county; flows southeasterly 8 miles into Childress Creek (tributary to Brazos River). Waco topographic map.

WILLOW CREEK.—Brewster County; an intermittent stream in southern part of county flowing southerly 10 miles into Rio Grande 5 miles southeast of Terlingua Abaja. Terlingua and Chisos Mountains topographic maps.

WILLOW CREEK.—Cooke County; small intermittent stream joining Spring Creek (which discharges into Elm Fork of Trinity River, and thus to the Trinity) south of Gainesville in the southern part of the county. Gainesville topographic map.

WILLOW CREEK.—Cottle County; small stream rising in southeastern part of county and flowing into North Wichita River (tributary to Wichita River and thus through Red River to the Mississippi).

WILLOW CREEK.—Gillespie County; rises about 5 miles northwest of Willow in the northeastern part of the county; flows southeasterly 12 miles into North Grape Creek (tributary through Pedernales River to the Colorado). Fredericksburg topographic map.

WILLOW CREEK.—Jack and Wise counties; joins Gentry Creek (tributary to West Fork of Trinity River and thus to the Trinity) in the southeastern part of Jack and southwestern part of Wise County.

WILLOW CREEK.—King County; rises in the northwestern part of the county; flows southeasterly 21 miles into South Wichita River (tributary through Wichita River to Red River and thus to the Mississippi) about 7 miles east of Guthrie in central part of county.

Willow Creek.—Harris County; rises in northwestern part 2½ miles southwest of Rose Hill School; flows easterly 17 miles into Spring Creek (tributary to San Jacinto River, Galveston Bay, and Gulf of Mexico); partially intermittent. Rose Hill, Louetta, and Spring topographic maps.

Willow Creek.—Lee County; a small intermittent stream flowing southeasterly 5 miles into Second Yegua Creek (tributary through Yegua Creek to Brazos River) south of Lexington. Bastrop topographic map.

Willow Creek.—Llano County; a stream 7 miles long flowing into Sandy Creek (tributary to Colorado River) 2 miles west of Lone Mountain, in the southern part of the county. Llano topographic map.

Willow Creek.—Llano County; an intermittent stream flowing into Johnson Creek (tributary through Llano River to the Colorado) northwest of the town of Llano in the northern part of the county; length, 9 miles. Llano topographic map.

Willow Creek.—Lipscomb County; an intermittent stream flowing northerly 7 miles into Wolf Creek (tributary through North Fork of Canadian River to the Canadian and thus through Arkansas River to the Mississippi) 6 miles east of Lipscomb in eastern part of county.

Willow Creek.—Mason County; rises 5 miles west of Fly Gap in the eastern part of the county; flows southeasterly 14 miles into Llano River (tributary to the Colorado) 3 miles east of Hedwigs Hill. Mason topographic map.

Willow Creek.—Maverick County; formed by the union of two streams, not named on map, rising near central part of county and flowing southward 8 miles; flows southerly 18 miles into Rio Grande 16 miles southeast of the town of Eagle Pass in soutern part of county.

Willow Creek.—McMullen and La Salle counties; rises in the eastern part of La Salle County; flows northeasterly 3 miles through La Salle County, then 6 miles through McMullen County into Frio River (tributary to the Nueces); length, 9 miles.

Willow Creek.—McLennan County; rises at McGregor; flows easterly 6 miles into South Bosque River (tributary to Bosque River and thus to the Brazos) in the southwestern part of county. Temple topographic map.

Willow Creek.—Parker County; rises approximately 1 mile north of Peister; flows southeasterly 13 miles into South Fork of Trinity River (tributary through Clear Fork of Trinity River to the West Fork of Trinity River and thus to Trinity River) about 4 miles southeast of Weatherford. Weatherford topographic map.

Willow Creek.—Roberts and Hutchinson counties; rises near Ochiltree-Roberts county line; flows southerly into Canadian River (which discharges into the Mississippi through Arkansas River) 4 miles northwest of Peaceville in northeastern part of Hutchinson County.

Willow Creek.—Runnels and Tom Green counties; tributary to Concho River (and thus to the Colorado) in the northeastern part of Tom Green County and southwestern part of Runnels County west of Miles; length, 13 miles. Hayrick topographic map.

Willow Creek.—Travis County; eastern part of the county; tributary through Elm and Wilbarger creeks to Colorado River; length, 11 miles. Bastrop topographic map.

Willow Creek.—Wilson County; rises in northeastern part of county; small tributary to Elm Fork of Sandies Creek (tributary to Sandies Creek, and thus to Guadalupe River).

WILLOWOAK CREEK.—Fannin and Hunt counties; rises in southeastern part of Fannin County near the southern boundary; flows southeasterly 11 miles into Middle Fork of Sulphur River (tributary to South Sulphur River, and thus through Sulphur and Red rivers to the Mississippi) in the northeastern part of Hunt County.

WILLOW MARSH.—Jefferson County; rises near Meeker in the northern part of the county; flows southeasterly 12 miles into Hillebrant Bayou (tributary to Taylors Bayou, and thus to Sabine Lake and Gulf of Mexico) 5 miles east of Cheek.

WILLOW MARSH.—Liberty and Jefferson counties; an intermittent slough; heads in eastern part of Liberty County; terminates in Pine Island Bayou (tributary to Neches River) in northwestern part of Jefferson County; length, about 25 miles.

WILLOW SPRINGS.—Donley County; small stream flowing through northeastern part of county into Whitefish Creek (tributary to Salt Fork of Red River, and thus through Prairie Dog Town Fork of Red River to the Red and Mississippi rivers).

WILLOW WATER HOLE BAYOU.—Harris County; rises in the southern part of the county; flows northeasterly 5 miles into Brays Bayou, thence to Ship Channel, Galveston Bay, and Gulf of Mexico. Alief and Bellaire topographic maps.

WILLOUGHBY BRANCH.—Mills County; small tributary in the northwestern part of the county; flows into Pompey Creek (tributary to Blanket Creek, and thus through Pecan Bayou to Colorado River) northwest of Mullen; length, 4 miles. Brownwood topographic map.

WILSON BRANCH.—Dickens County; flows southerly 10 miles to its junction with Duck Creek (tributary to Salt Fork of Brazos River, and thus to the Brazos) 2 miles southeast of Steel Hills in southern part of county.

WILSON BRANCH.—Johnson County; small intermittent stream west of Freeland in southern part of county, flowing into Camp Creek, and thus to Brazos River. Granbury topographic map.

WILSON CREEK.—Collin County; rises about 2 miles east of Celina; flows southeasterly 21 miles into East Fork of Trinity River (tributary to the Trinity) 3 miles southwest of Culleoka.

WILSON CREEK.—Johnson County; a stream 4 miles long flowing southwesterly into Brazos River at eastern extremity of "De Cordova Bend" in western part of county. Granbury topographic map.

WILSON LAKE.—Bowie County; about 6½ miles north of Hook's post office in northeastern part of county; formed by an old channel of Red River (tributary to the Mississippi).

WILSONS CREEK.—Matagorda County; small tributary to Tres Palacios Creek (thence to Matagorda Bay and Gulf of Mexico) in the western port of the county; flows southwesterly; length, 2 miles.

WINAN CREEK.—Bandera County; small intermittent stream in eastern part of county; flows into Medina River (and thus through the San Antonio into Guadalupe River) 5 miles northwest of Bandera.

WIND RIVER.—Hall and Motley counties; rises in southwestern part of Hall County; flows southeasterly 16 miles into Pease River (tributary to Red River, and thus to the Mississippi) at its intersection with the north line of Motley County about 4 miles northwest of Northfield.

WINDMILL CREEK.—Zavalla County; small intermittent tributary to Turkey Creek (thence to the Nueces through Elm Creek) in the northwestern part of the county; length, 9 miles. Uvalde topographic map.

WINTER CREEK (PEARL STREAM).—Walker and San Jacinto counties; rises in Walker County a few miles southeast of Huntsville; flows southeasterly 10 miles through Walker County, then southeastward 20 miles through Montgomery County into East San Jacinto River (thence to Gulf of Mexico through San Jacinto River) near the southeastern San Jacinto County line.

WIRE HOLLOW CREEK.—Runnels County; rises south of Norwood in the southeastern part of the county; flows into Mustang Creek and thus to the Colorado; length, 7 miles; intermittent. Ballinger topographic map.

WISE CREEK.—Wheeler County; a stream 4 miles long flowing southerly through northwestern part of county into Water Creek (tributary to North Fork of Red River and thus through the Red to the Mississippi) about 3 miles northwest of Mobeetie.

WOLF BRANCH.—Coryell County; small intermittent stream flowing southerly 3 miles to a point west of New Sugar Loaf, where it joins Cowhouse Creek, and thus through Leon and Little rivers to the Brazos. Gatesville topographic map.

WOLF BRANCH.—Erath and Hood counties; flows southwesterly 5½ miles to its junction with Berrys Creek (which discharges into Brazos River through Paluxy Creek) near Bluff Dale. Stephenville and Granbury topographic maps.

WOLF CREEK.—Cooke County; rises in southeastern part; flows southerly 8 miles into Isle du Bois Creek, which discharges into Trinity River through the Elm Fork of the Trinity. Gainesville topographic map.

WOLF CREEK.—Kerr and Gillespie counties; rises 6 miles northeast of Kerrville in the northeastern part of Kerr County; flows northeastward 10 miles into Pedernales River (tributary to Colorado River) 8 miles southwest of Fredericksburg in the southern part of Gillespie County. Kerrville and Fredericksburg topographic maps.

WOLF CREEK.—Llano County; an intermittent stream 4 miles in length flowing through Babyhead Creek into Pecan Creek, and thus through Llano River into the Colorado west of Babyhead in the northern part of the county. Llano topographic map.

WOLF CREEK.—Motley County; rises in the southwestern part of county; flows southeasterly 4 miles into Olive Fork of South Pease River (tributary through South Pease and Middle Pease rivers to Pease River and thus through Red River to the Mississippi).

WOLF CREEK.—Ochiltree and Lipscomb counties; rises 7 miles northwest of Ochiltree in western part of Ochiltree County; flows westerly across Ochiltree and Lipscomb counties into Oklahoma at a point 12 miles east of Lipscomb, where it enters North Fork of Canadian River (tributary to Canadian River and thus through Arkansas and Red rivers to the Mississippi) near Supply, Okla.

WOLF CREEK.—Collingsworth County; rises in the northeastern part; flows easterly 9 miles into Elm Fork of Red River (tributary to North Fork of Red River and thus through the Red to Mississippi River).

WOLF CREEK.—Hunt County; flows into Cowleach Fork of Sabine River (thence to Sabine River through Caddo Fork of Sabine River) about 3 miles east of the town of Greenville.

WOLF CREEK.—Palo Pinto County; rises 2 miles north of Brad in northwestern part of county; flows northerly 5 miles into Brazos River. Palo Pinto topographic map.

WOLF CREEK.—Throckmorton County; a northward flowing stream joining Millers Creek (tributary to the Brazos) near Throckmorton-Baylor county line in northwestern part of county.

Wolf Creek.—Tyler County; rises about 3 miles southwest of Colmesneil; flows southeasterly 14 miles into Neches River about 1 mile east of Pedigo.

Wolf Creek.—Washington County; rises near Gay Hill; flows northerly 4 miles into Yegua Creek (tributary to Brazos River) 2½ miles southwest of Scofield. Gay Hill topographic map.

Wolf Creek.—Wichita County; a stream 4 miles long flowing southerly into Wichita River (tributary to Red River and thus to the Mississippi) in the southwestern part of the county.

Wolf Fork of Tehuacana Creek.—Limestone and Freestone counties; rises about 5 miles northeast of Mexia in Limestone County; flows southeasterly 6 miles into Tehuacana Creek (tributary to Trinity River) 3 miles south of Tehuacana.

Wolf Hollow.—Montague County; rises about 2 miles northwest of Pearson in northern part of county; flows into Panther Creek (tributary to Red River and thus to the Mississippi); intermittent; very small. Montague topographic map.

Wolfpen Creek.—Hopkins County; rises in northeastern part of county; flows southeasterly 9 miles into Whiteoak Bayou (tributary to Sulphur River and thus through Red River to the Mississippi).

Wood Branch.—Tarrant County; near Benbrook; small stream flowing into Marys Creek (tributary to Clear Fork of Trinity River, thence through West Fork of the Trinity to Trinity River). Weatherford and Fort Worth topographic maps.

Wood or Hickory Creek.—Polk, Tyler, and Hardin counties; rises about 5 miles northeast of Kiam in Polk County; flows southeasterly 33 miles into Alabama Creek (tributary to Neches River) about 4 miles northwest of Village Mills in Hardin County.

Wood Hollow.—Erath County; a short intermittent stream flowing southerly into South Bosque River (tributary to Bosque River and thus to the Brazos) northeast of Lingleville; length, 2½ miles. Stephenville topographic map.

Wood Slough.—Uvalde County; small intermittent tributary to Turkey Creek (thence to the Nueces through Elm Creek) in the southwestern part of the county; length, 9 miles. Uvalde topographic map.

Woodwards Creek.—Washington County; rises 4 miles southeast of Brenham; flows northerly 5 miles into New Years Creek (tributary to Brazos River) 3 miles northeast of Brenham.

Wooley Branch.—Lee County; a small stream flowing southwesterly 5 miles into Third Yegua Creek (tributary to Yegua Creek and thus to the Brazos) 1 mile south of Darden Springs in western part of the county. Bastrop topographic map.

Wray Creek.—Harrison County; small stream in northern part of county flowing into Caddo Lake, which discharges into the Mississippi through Red River.

Wright Creek.—Llano County; small intermittent stream rising north of Babyhead; flows southerly into Mitchell Creek (tributary to Llano River and thus to the Colorado). Llano topographic map.

Wright Creek.—Jasper County; rises in the central part of the county; flows southwesterly 6 miles into Neches River.

Wrights Creek.—Trinity County; small tributary to Trinity River in northwestern part of county.

WUSSER CREEK.—Palo Pinto County; rises 1½ miles west of Jacobs Wells in southeastern part of county; flows northerly 9 miles into Palo Pinto Creek (tributary to Brazos River) 3 miles southwest of Brazos. Palo Pinto topographic map.

YANKEE CREEK.—Rockwall County; small stream flowing into East Fork of Trinity River (tributary to the Trinity) northwest of Heath in the southwestern part of the county; intermittent. Barnes Bridge topographic map.

YANKEE RHEA CREEK.—Crosby County; rises 9 miles south of Crosbyton; flows easterly 6 miles into Davidson Creek (tributary through White River to the Salt Fork of Brazos River and thus to the Brazos) in southeastern part of county.

YEGUA CREEK.—Washington, Burleson, and Lee counties; formed near Burleson-Lee county line in southeast corner of Lee County, 5 miles southeast of Dime Box by union of First Yegua and Second Yegua creeks; flows easterly 30 miles, along Burleson-Washington county line, into Brazos River near Sand Pit on Gulf, Colorado & Santa Fe Railroad. Gay Hill topographic map.

YELLOW BAYOU.—Newton County; rises about 3 miles east of Farrsville; flows easterly 10 miles into Little Cow Creek (tributary to Sabine River) about 3 miles southeast of Burkeville.

YELLOW BRANCH.—Leon County; a small stream flowing into Boggy Creek (tributary to Trinity River) in southern part of county.

YELLOW BRANCH.—Stephens County; small intermittent stream rising 7½ miles northeast of Breckenridge; flows northwesterly into Gonzales Creek (tributary to Clear Fork of Brazos River and thus to the Brazos); intermittent. Breckenridge topographic map.

YELLOWBANK CREEK.—Lavaca County; rises 3 miles east of Sweet Home; flows easterly 6 miles into Rocky Creek (tributary to Lavaca River, Matagorda Bay, and Gulf of Mexico) 7 miles south of Hallettsville.

YELLOW HOUSE RIVER.—Lubbock, Hockley, and Cochran counties; rises in a series of small lakes in the extreme northeast corner of Cochran County; flows southeasterly 60 miles into North Fork of Double Mountain Fork of Brazos River (tributary through Double Mountain Fork of the Brazos to Brazos River) near the town of Lubbock in central part of Lubbock County.

YGNACIO CREEK.—McMullen County; small intermittent tributary to Mirasol Creek (thence to Nueces River) in the southwestern part of the county; length, 3 miles.

YO-LO-DIGO CREEK.—Zavalla and Frio counties; rises in the northeastern part of Zavalla County; flows southeastward 12 miles through Zavalla County, then 3 miles through Frio County into Leon River (tributary to Frio and Nueces rivers) 5 miles northwest of Divot.

YOPON CREEK.—Washington County; rises in southern part of county; flows southeastward 3 miles into East Fork of Mill Creek (tributary through Mill Creek to Brazos River).

YORK CREEK.—Hays and Guadalupe counties; rises south of Center Point in Hays County; flows southeasterly 3 miles through Hays County, then 16 miles through Guadalupe County into San Marcos River (tributary to the Guadalupe) 2 miles south of Prairie Lea. San Marcos topographic map.

YORKS CREEK.—Madison County; small stream flowing into Trinity River northeast of Midway in eastern part of county.

YOUNGS BRANCH.—Lavaca County; small intermittent stream in northwestern corner of county; flows southerly 6 miles to its junction with Lavaca River, and thus to Matagorda Bay and Gulf of Mexico. Flatonia topographic map.

Youngs Fork of Anderson Creek.—Red River and Bowie counties; rises 1 mile east of Avery in Red River County; flows southeasterly 8 miles into Anderson Creek (tributary through Sulphur River to Red River and thus to the Mississippi) about 2½ miles southwest of Dekalb.

Zacatosa Creek.—Val Verde County; rises 6 miles north of Johnstone; flows southerly 17 miles into Sycamore Creek (tributary to Rio Grande) 1 mile north of mouth of Sycamore Creek.

Zacatosa Creek.—Webb County; rises in southwestern part of county; flows southerly 7 miles to its junction with San Isabel Creek (tributary to Rio Grande) northwest of Laredo; intermittent.

Prepared in cooperation with the
CONNECTICUT STATE GEOLOGICAL AND NATURAL HISTORY SURVEY
Herbert E. Gregory, Superintendent

WASHINGTON
GOVERNMENT PRINTING OFFICE
1920

April and May, 1915. The area covered comprises about 137 square miles and includes the towns of Berlin, Cromwell, Meriden, Middlefield, Middletown, and Rocky Hill. The work consisted chiefly in collecting records of a sufficient number of wells in each town to furnish adequate data concerning the ground water. In connection with this study, the Pleistocene glacial deposits—till and stratified drift—which cover nearly all the surface, were carefully observed, and as they differ considerably in their water-bearing capacity, they were separately mapped (see Pl. II, in pocket) as well as could be done in the time available for the work. The till consists of unassorted gravel, sand, and clay, deposited by the glacial ice sheet as it melted, and in general is not a good water bearer, because its heterogeneous material is unfavorable to the easy circulation of ground water. The stratified drift consists of bedded deposits of glacial materials which were to some extent assorted and redeposited by streams that were formed largely by the melting ice, and because the materials are thus assorted the circulation of ground water is generally freer in these deposits than in the unassorted deposits of till. The map (Pl. II) shows the areas covered by stratified drift as determined with special reference to water-bearing capacity. Detailed study of the glacial geology of the region based on the origin and source of the material would probably result in considerable changes in the geologic boundaries, especially in places where the transition from stratified drift to till is obscure.

Exposures of the bedrock underlying the glacial material were also noted (see Pl. II, in pocket), but the map of bedrock geology and its structure (Pl. III, in pocket) is copied with only slight changes from geologic maps of the region prepared by Davis[1] and by Gregory and Robinson.[2] This map of the bedrock structure is reproduced with the present report because it is believed that it will be of assistance to property owners and to drillers in forecasting the kind of material that will be encountered in drilling wells. Throughout the area the successive rock formations are present in the order in which they are shown in the legend of Plate III. The first rock encountered at any place in the area will be that indicated by the color at that point on the map, and this rock is in most places successively underlain by the other formations in the order indicated in the legend. For example, in sinking wells in the city of Meriden the first rock reached is the lower sandstone, and this material continues for many hundred feet down to the ancient crystalline rocks, except, possibly, where it may be interrupted by dike rocks.

MAN THE PRESENT
Y

At Middletown, however, the first rock encountered is the upper sandstone, and this rock is believed to be successively underlain by trap sheets and by other sandstones that extend for several thousand feet down to the crystalline rocks. A few exceptions to the regular succession of the beds may be found in localities close to the fault zones, where blocks of the different rocks have been broken off and shifted from their normal positions. Such displacement and crushing may explain the presence of trap rock in the Worthington School well, at Berlin village (Berlin well 46, p. 31), though the geologic structure at this place (section C–D, Pl. III) indicates that the trap is several hundred feet below the surface. It is probable also that there are minor faults whose presence has not been detected.

The wooded areas were mapped incidentally (see Pl. IV, in pocket) because they affect to some extent the storage of ground water. The maps in this report also show certain changes in the roads and other cultural features that have taken place since the area was mapped topographically by the United States Geological Survey.

GEOGRAPHY.

The State of Connecticut may be divided into three physiographic provinces—the central lowland, the eastern highland, and the western highland. (See Pl. I.)

The area described in this report is in the south-central part of the State, and is chiefly in the central lowland, or Connecticut Valley, but its southeastern end lies in the eastern highland. From Connecticut River, which borders it both on the north and the east, the highland area rises in steep slopes that culminate in hills more than 600 feet in elevation. The surface of the lowland to the west is also broken by numerous hills and ridges, but the greater part of it is less than 300 feet above sea level, and it is dotted with lakes, ponds, and marshes.

In the part of the central lowland here considered the hills and ridges trend uniformly north-northeast. The most prominent ridge in the entire lowland area of the State is that which forms the Hanging Hills (Pl. V, *A*) 2 or 3 miles northwest of Meriden and which attains its maximum height, 1,007 feet above sea level, in West Peak.

Connecticut River is a quarter of a mile in average width where it borders the Meriden area, and it is affected by the tide for some distance farther upstream, to the city of Hartford. Mattabesset River, which drains most of the area and enters the Connecticut near Middletown, is also affected by the tide for several miles above its mouth. Quinnipiac River, which crosses the southwestern corner and receives the drainage of the southwestern part of the area, falls 60 feet in the 10 miles between South Meriden and the tidal limit at Quinnipiac.

About 30 per cent of the Meriden area is wooded (see Pl. IV, in pocket), chiefly with chestnut, oak, and maple. Practically all the woods consist of second or later growths, the mature trees having long ago been cut for timber or for fuel. Numerous wood lots in the farming areas furnish fuel and posts for local use, but the lower lands, originally heavily wooded, have been cleared and are given over to agriculture.

The cities of Meriden and Middletown—the principal centers of population—are in the towns of the same names in the southwestern and southeastern parts, respectively, of the area. Each of the other four towns—Berlin, Cromwell, Middlefield, and Rocky Hill—contains a village named for the town, and a few other communities are scattered throughout the area. Meriden and Middletown are manufacturing cities, carrying on factory and foundry industries. At most of the villages there are also factories and mills, but hay farming, fruit raising, and dairying occupy a large part of the population.

Transportation facilities in this part of Connecticut are good. The main line of the New York, New Haven & Hartford Railroad passes through the city of Meriden and the village at Berlin station; the Valley division follows the western bank of Connecticut River and passes through the city of Middletown and the villages of Cromwell and Rocky Hill; and the Air Line division passes through Middlefield and Middletown. Trolley lines connect Middletown, Meriden, and Berlin stations and neighboring villages. The Connecticut still affords transportation between river towns, but navigation on this old trade route has become of minor importance.

The climate of the region is not severe, the latest killing frost usually being in the last part of April,[1] and the earliest in the last part of October.[2] The mean annual temperature is about 47° F.[3]

The average precipitation is about 48 inches and is fairly evenly distributed throughout the year, as shown in figures 1 and 2.

These average figures of temperature and precipitation are believed to represent closely the conditions throughout the greater part of the Meriden area. In the lowlands bordering Connecticut and Mattabesset rivers and on the higher ridges the winter temperatures are probably somewhat lower, however, and on the ridges the precipitation is doubtless somewhat greater than at Middletown, the only station in the area for which a long record is at hand.

GEOLOGY.

The [illegible] shales, and lavas of the Meriden area are Triassic [illegible] the [illegible] crystalline rocks are the altered equivalents of [illegible] and [illegible] which during Paleozoic time occupied [illegible] the close of the Paleozoic era the previously [illegible] were [illegible] folded and uplifted into mountains. [illegible] the long period of erosion that followed the ranges [illegible] of these Paleozoic mountains were worn into [illegible] separated by shallow valleys. It is believed that at the close of the Paleozoic era central Connecticut was one of these [illegible] valleys near sea level or perhaps submerged. Into this valley was carried rock waste—sand, gravel, and mud—from the surrounding uplands. During the early part of the Triassic period the bottom of the valley was not much lower than its rim, but while sediments were being deposited the floor of the valley was broken and its east side was dropped much lower than the border. This great displacement deepened the valley and the thick deposits of sand and mud were gradually hardened to sandstone and shale. At three periods during the deposition of Triassic sediments molten rock made its way to the surface and spread widely as lava flows. As a result of sedimentation and igneous activity the Triassic deposits between the surface and the floor of the ancient valley form the following sequence:

1. Sandstone and shale (surface).
2. Lava.
3. Sandstone and shale.
4. Lava.
5. Sandstone and shale.
6. Lava.
7. Sandstone and conglomerate.

At the end of the Triassic period, or perhaps early in the succeeding Jurassic period, a mountain-making uplift took place in Connecticut. The sandstones and lavas in the Connecticut lowland were broken by faults and tilted into a series of ridges with steep westward and gentle eastward slope. A period of erosion, very long even in geologic time, then followed. Rivers on the land and the waves of the sea wore down the surface of the entire region—ancient highlands and uplifted lowlands alike—to an undulating plain, above which scattered hills rose a few hundred feet.

During the Tertiary period the region was again uplifted, and though the earth movements were not so great as those of earlier times, they increased the slope and activity of the streams and thus gave new impetus to erosive processes that have carved the whole region into the prominent hills and valleys that now form its main features. Triassic rocks have been worn down much more than the nore resistant ancient crystalline rocks on each side, so that a lowand, comparable with the greater depression of Triassic time, has igain been formed, bounded by an eastern and a western highland, is indicated in Plate I. Where the edges of the hard layers of trap rock were brought to the surface by the extensive faulting late in Triassic or early in Jurassic time, they have resisted erosion more than the softer shales and sandstones with which they are interbedded, and they now stand out in many places as prominent ridges in the lowland.

During the Pleistocene or glacial epoch all Connecticut probably was covered several times by great sheets of ice, which in its slow movement southward scoured off the soil that had been formed by the weathering of the rocks. When the last of the ice sheets melted, however, it deposited large quantities of gravel, sand, and clay that it had gathered up and thus formed a new coating of loose material over the bedrock; otherwise the greater part of the region would to-day consist of bare, rocky slopes on which agriculture would be practically impossible.

Since the disappearance of the ice there has been little change in the surface features of the Meriden area. The greater part of the area is included in the area of Triassic deposition, and the most prominent ridges in it are formed by the broken and tilted edges of the thickest of the three trap sheets.

These three sheets of trap rock, which have become known as the "Anterior" or lower sheet, the "Main" sheet, and the "Posterior" or upper sheet, have in this area thicknesses, respectively, of about 250 feet, 400 to 500 feet, and 100 to 150 feet. The "Posterior" and "main" sheets are separated by about 1,200 feet of sandstone and shale. Between the "Main" and "Anterior" sheets the sedimentary rocks are considerably thinner, but the series of trap sheets is both underlain and overlain by several thousand feet of sandstone and shale. The manner in which the rocks have been faulted and the prominent ridges have been formed is indicated in the structure sections (Pl. III, in pocket).[1]

Only one noteworthy dike has been found in the area. This dike is exposed along the hillside south of the city of Meriden and seems to have a maximum width of 15 or 20 yards.

The southeastern part of the area is underlain by the ancient gneisses and other crystalline rocks of the eastern highland. It is

[1] The delineation of bedrock areas and fault lines on this plate is reproduced from the map accompanying a detailed report by W. M. Davis on the region (U. S. Geol. Survey Eighteenth Ann. Rept., pt. 2, pl. 19, 1898), modified slightly in accordance with the preliminary geological map of Connecticut, prepared by H. E. Gregory and H. H. Robinson (Connecticut Geol. and Nat. Hist. Survey Bull. 7, 1907). The structure sections are patterned after the section by W. M. Davis (U. S. Geol. Survey Eighteenth Ann. Rept., pt. 2, pl. 20, 1898) and one by Joseph Barrell (Central Connecticut in the geologic past: Connecticut Geol. and Nat. Hist. Survey Bull. 23, fig. 1, 1915).

in area of rugged hills, or the change from the sedimentary lowland to the crystalline highland is not markedly shown by the surface features in this part of the boundary zone.

Although the ice sheet did not materially change the main features of the region, it caused numerous minor changes and produced a few new features, chiefly drumlins, or rounded hills of till and sand plains. In a few places eskers, or long, low ridges of stratified drift like that shown in Plate VI, A, were made by material that was probably deposited along stream channels that were formed beneath the ice sheet.

The most notable changes, however, were due to the diversion of drainage by the blocking of the former stream channels, either by the ice itself or by its deposits of gravel, sand, and clay. The drainage of the main part of the Meriden area by Mattabesset River to the Connecticut was probably substantially the same for some time prior to the glacial epoch as it is now. The course of Quinnipiac River, however, from Southington to New Haven is believed to have been more direct in Tertiary time than it is now. Some geologists consider that its present course through southwestern Meriden was adopted after the glacial epoch because of obstruction of its preglacial channel farther west by deposits left by the melting ice. The theory that Quinnipiac Gorge has been cut since the glacial epoch has been questioned by Ward,[1] who believes that the river cut this gorge in preglacial time. He suggests that relatively slight upwarping of the bedrock along an axis trending N. 70° W. may have diverted the river eastward from an earlier, more direct course.

The unstratified glacial material, or till, covers nearly all the higher lands. Along the stream valleys the glacial materials were to some extent sorted by water from the melting ice, and the gravel, sand, and clay were redeposited in more of less stratified layers, as is shown in Plate VI, *B*. This stratified drift and the till have been separately shown on the map of the surface geology (Pl. II, in pocket) because of their different characteristics as water-bearing formations.

The glacial material completely covered the region, but in general the layer of unconsolidated deposits is only a few feet thick. Over most of the higher lands it is too thin to be of value as a water carrier, the underlying rock being visible at numerous points. The localities at which the bedrock was seen by the author are indicated on Plate II by distinctive colors for the sandstone and shale, the trap rock, and the ancient crystalline rocks; doubtless there are other rock outcrops that he did not observe. In many places the outcrop is only a few feet in extent, and the size of the area of exposure is neces-

B. STRATIFIED DRIFT NEAR HARBOR BROOK, MERIDEN, CONN.

sarily exaggerated on the map. The principal rock exposures indicated on Plate II mark the prominent cliffs of the trap ridges, and the distribution of the minor exposures shows that in many places the glacial deposits covering the bedrock are very thin over large areas. Many of the bedrock exposures shown on the maps are along roads, where, of course, they are more readily observed, though the glacial material is in many places so thin that the bedrock is exposed by the road cuts and grades. On the higher lands the till is so thin that it is not easy to delineate the boundaries of the actual rock exposures. This is particularly true of the trap ridges; and the author's mapping of the exposures of trap rock on those ridges, shown on Plate II, might be modified considerably by another investigator carrying on a similar study of the region.

GROUND-WATER SUPPLIES.

WATER IN STRATIFIED DRIFT.

Stratified drift, which covers the lowlands of the Meriden area, consists chiefly of more or less definitely bedded deposits of clay, sand, and gravel, and the material as a whole offers conditions for the storage of water that are similar to those of the deposits of present-day streams, but the stratified drift contains a greater proportion of clay than is contained in those deposits, and in many places it is not so good a water bearer. The more sandy beds of stratified drift readily absorb rain, however, and are therefore important as water-bearing material.

WATER IN TILL.

The deposits of till that cover most of the Meriden area vary in character from relatively loose masses containing stones and some clay and sand to hard, compact masses of stones, sand, and clay cemented into a hardpan. The till contains large quantities of water, most of which is derived directly from precipitation, but its value as a source of supply differs according to its texture. The loose sandy or gravelly masses may yield fairly large and permanent supplies of water to wells, but the areas of sandy material are small, and those in which clay predominates are relatively large, so that till as a whole is a rather poor water-bearing material. In many places water is encountered in till at shallow depths because the clay in the till does not allow water to penetrate far below the surface, but the clay also prevents the rapid inflow of water to wells. Wells in till, therefore, usually furnish only scanty supplies, and many of them are likely to fail during periods of drought.

the [illegible] of the water-bearing material: in gravel or coarse sand, which [illegible] its water freely, fewer wells will be required [illegible] than in deposits of fine sand, which yields water [illegible]. The most efficient spacing of wells ranges from about [illegible] feet in fine sand to [illegible] feet in coarse gravel. It is usually advisable to sink wells to the full depth of the water-bearing strata in order that as large yields as possible may be obtained. Wells that are drilled or bored in loose materials must be cased, usually with iron or steel pipe, to prevent caving, and the casings must be perforated or sections of perforated casing must be used in place of the casing in the water-bearing beds in order that the water may enter. In coarse sand and in gravels the casing may be satisfactorily perforated by drilling many holes one-fourth or three-eighths inch in diameter in it or by slitting the casing after it is placed in the well by means of a powerful cutting device lowered inside the casing. In fine sands various patterns of slotted and wire-gauze screens are used. A satisfactory screen for use in fine material is also sometimes made by winding heavy wire closely around casing in which a great number of holes one-fourth or three-eighths inch in diameter have been drilled. After a well has been finished in unconsolidated material it is usually advisable to pump it strongly in order to remove the fine sand around the casing. The coarser material that remains will form a protective strainer around the casing that will lessen the tendency of the screen or perforations to become clogged and thus increase the yield of the well. Some screens that become clogged by fine sand against the outside, which can not be removed by strong pumping, can be cleaned by turning air, water, or steam under high pressure into the well.

Some waters deposit mineral matter, usually calcium carbonate or a compound of iron, on the meshes of fine screens and in time seriously reduce the yield. These materials can rarely be loosened while the screen is in the well. In localities where such difficulty is encountered, the diameter of the wells should be sufficiently large so that the sections of screen can be lowered inside the casing and be easily removed for cleaning. If the water level is at so great depth that a cylinder pump, an air lift, or other raising device must be installed in each well, casing 6 or 8 inches or larger in diameter should be used. If the water level remains during pumping within the practicable suction lift of about 25 feet, pumps may be installed at the surface and the water raised by suction, either by a pump on each well or by a pump that is connected by air-tight suction mains to several wells. Centrifugal pumps are extensively used for lifting water from shallow depths, and they are employed for lifting water from greater depths by installing them in pits.

QUALITY OF GROUND WATER.

Twenty-four samples of water were collected by the author on May 18 and 19, 1915, and were analyzed under contract for the United States Geological Survey by S. C. Dinsmore.

These analyses, except those of three waters which were probably contaminated (Berlin well No. 85, Cromwell well No. 41, and Middlefield well No. 26), are grouped in the following table according to the geologic source of the waters—whether stratified drift, till, sandstone, or trap. The springs, although probably they derive their water chiefly from the sandstone or the trap, may also contain water from the overlying glacial materials, and hence their analyses are not grouped with those of the well waters. The analyses are too few to warrant broad deductions as to the quality of the waters, but they seem to indicate certain general differences in the waters from different kinds of material.

The analyses show a range in total dissolved solids from 80 parts per million parts of water in one of the wells ending in till to 367 parts per million in one of the wells ending in trap, the average being 181 parts per million. The lowest average of total solids (104 parts per million) is shown by the analyses of the spring waters, but the lowest amount was found in the water from a well ending in till (Berlin well No. 107). In general the waters from the rock formations (sandstone and trap) are noticeably more highly mineralized than those from the glacial drift (stratified drift and till), the higher total contents being due chiefly to greater amounts of the scale-forming constituents—calcium, magnesium, bicarbonate, and sulphate.

Nearly all the waters are of the calcium-carbonate type. The average amounts of calcium and magnesium are distinctly higher in the waters from the rock than in those from the glacial drift. The average ratio of magnesium to calcium is nearly 1 to 3. In about half the waters the ratio is fairly constant, but in the others it ranges from 1 part of magnesium to 10.95 parts of calcium (Meriden well No. 52), both extremes being found in waters from sandstone.

The content of sodium and potassium is low in all the waters. Only traces of these elements are reported in five of the waters, and they form less than 1 per cent of the total solids in three others. They are highest in a sandstone water (Meriden well No. 52), in which, however, they amount to only 24 parts per million. So far as these few data show, the rock waters contain lower average amounts of these constituents than the waters from the glacial drift.

The average content of sulphates is higher in the rock waters than in the waters from the glacial drift. In only two of the samples, however (Berlin well No. 53 and Meriden well No. 52), does the sulphate radicle exceed 50 parts per million.

Chlorides form only a small percentage of the total dissolved solids, although the quantity shown by most of the analyses much exceeds that indicated by the isochlors that have been drawn for the State.[1] The percentage is higher for the waters from the stratified drift and till than for the waters from the sandstone, but this may be due to the fact that wells ending in drift, many of which are shallow dug wells, are more exposed to pollution than those ending in sandstone, most of which are drilled and are deeper.

[a] Calculated.

Nitrate is reported to be absent from one spring water and two sandstone waters. It reaches a maximum amount in the water

[1] Jackson, D. D., The normal distribution of chlorine in the natural waters of New York and New England: U. S. Geol. Survey Water-Supply Paper 144, p. 20, 1905.

from Cromwell well No. 6, which ends in stratified drift. The high nitrate content of this water and of some of the other waters may be due to the presence of considerable organic matter, but it is evident that pollution exists in a number of the waters. Although the evidence is based on mineral and not sanitary analyses, any water that contains more than 25 parts per million of nitrate and an amount of chloride much higher than the average should receive a bacteriologic examination before being used for drinking.

Some of the waters analyzed are rather hard and poor for use in boilers, but on the whole their quality compares favorably with that of ground waters in other parts of the country.

The use of drilled wells drawing water from the rock for domestic supplies is advisable in many places, even though the rock water may be somewhat harder than the water from the glacial deposits, because more dependable supplies are assured and the danger of contamination is reduced.

Further discussions of the ground waters and statements pertaining to their economic value[1] are presented in the descriptions of the towns from which they were obtained.

DESCRIPTIONS OF TOWNS.

BERLIN.

HISTORICAL SKETCH.

The town of Berlin occupies the northwestern part of the Meriden area. The first white settler in the present town was Sergt. Richard Beckley, a planter from New Haven, who about 1660 established his home on 300 acres of land in the valley of Mattabesset River, near the present village of Beckley. Within the next few decades a settlement known as Beckleys Quarter was built up in the vicinity, and another settlement, which was known as the Great Swamp, in the lowland to the west. In 1705 these early settlements were organized as a society of the community of Farmington, which originally embraced also the town of New Britain, to the north. This society was for a time known as Farmington Village, but in 1722 the western part adopted the name of Kensington. In 1754 the northern part organized as the society of New Britain, and by 1785 the population had so increased that additional organization was warranted. The three societies of New Britain, Kensington, and the original settlement, then known as Worthington, accordingly incorporated as the town of Berlin. At the time of incorporation and for many years after Worthington (now East Berlin) was the principal place of business. In 1850 the town was again divided, the societies of Kensington and Worthington retaining the original

[illegible] New Britain [illegible] town of New Britain.

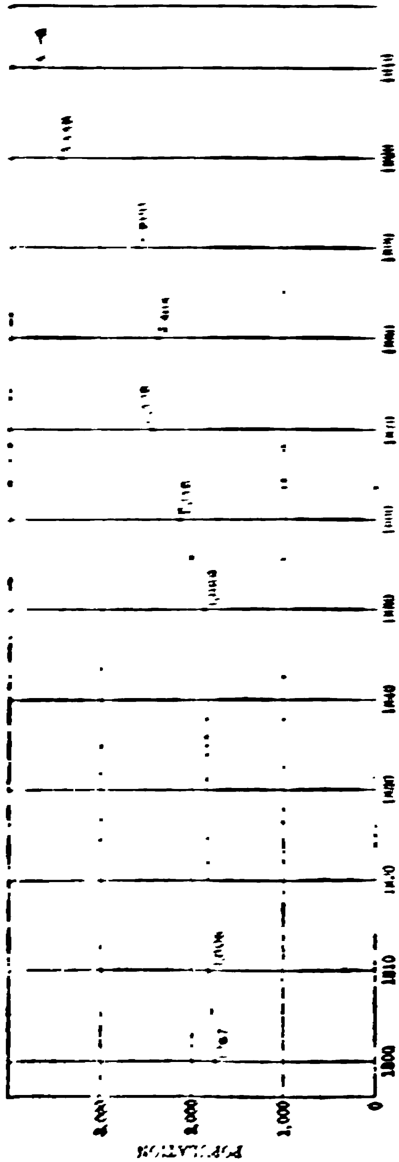

FIGURE 4.—Curve showing population of the town of Berlin, Conn.

The town of Berlin now contains the villages of Berlin, East Berlin, Beckley, and Kensington and covers an area of about [illegible] acres, according to planimeter measurements on the Meriden and Middletown topographic maps.[1] About 36 per cent of the total area is wooded. (See Plate ?.) Nearly 5 per cent is marsh land, comprised almost entirely in a tract between the villages of Berlin and East Berlin. Several ponds and reservoirs in the town cover an area of about [illegible] acres.

POPULATION AND INDUSTRIES.

Records of the early population within the present limits of the town have not been found by the author. From about 1660 until a number of years after the incorporation of the town in 1785, growth must have been fairly rapid, for in 1800 Kensington had a population of 764 and Worthington 1,0?6. During the following decade Kensington lost 8 and Worthington gained 47 people;[2] but 40 years later, shortly after the incorporation of New Britain as a separate town, the total population of Kensington and Worthington (forming the town of Berlin) had gained only 60. Since 1850 the growth has been more rapid, as is shown in figure 4.

[1] The assessor's returns for 1915 give a total of 15,1?? acres. The area given on p. 41? of the Connecticut State Register and Manual for 1915—10,516 acres—is evidently in error.

[2] Camp, D. N., History of New Britain, with sketches of Farmington and Berlin, Conn., p. 19?, New Britain, 1889.

This increase has been due largely to the railroads that were built through the town from Meriden in 1839 and from Middletown about 1845, for these transportation lines began in a few years to attract manufacturing industries.

The manufacture of tinware in Connecticut was begun in Berlin about the time of the American Revolution, and a number of other industries were early developed, water power being used for factories as well as for gristmills. At present the chief industries are the manufacture of iron bridges and other structural iron work at Berlin station, jewelry at East Berlin, and envelopes, paper bags, and other paper articles at Kensington.

The uplands of the town are noted for fruit raising, and the lowlands have long been devoted to hay raising and to pasturage. In the lowland near Beckley and near Berlin station brickmaking has also been carried on extensively for many years.

SURFACE FEATURES.

The highest points in the town of Berlin are the crest of South Mountain, on its southwest border, at an elevation of 790 feet, and the crest of Ragged Mountain, on its northwest border, at an elevation of 754 feet. The Hanging Hills, in the southern part of the town, and Lamentation Mountain, in its southeastern part, form prominent highlands that trend east of north. From these prominent ridges the surface slopes northward through rolling hills down to extensive lowlands along Mattabesset River. Where this stream leaves the town and swings eastward its channel is only a few feet above the tide.

The higher parts of the town are densely wooded with second or later growths of chestnut, oak, and other trees, and numerous wooded patches dot the lower hills. The open valley lands are, however, practically free from timber. (See Pl. IV, in pocket.)

STREAMS.

Practically the entire town is drained by Mattabesset River and its tributaries, the only exception being a small area on the southern border, which drains southward through Cathole Gorge. The western and southern boundaries of the town represent approximately the limits of the Mattabesset drainage basin in those directions. In conformity with the main topographic features, the tributaries of the Mattabesset flow in a fairly direct course east of north to the major stream, which winds eastward through the lowland of the northern part of the town, and then, after flowing southward, forming the town line for 3 miles, it turns east and southeast to Connecticut River.

orm Willow Brook, which flows for more than a mile eastward and outhward across the lowland and joins the Mattabesset 1½ miles elow the mouth of Belcher Brook. In the saturated lowland Villow Brook is a sluggish stream whose average flow is difficult to letermine, and near its mouth the probable accession of water from he New Britain sewage beds renders measurements of the flow of he stream unreliable. The natural flow in its lower course seems to e only 1 or 2 second-feet. Webster Brook, a small, sluggish stream hat comes from the north and drains only lowlands, also enters the Mattabesset near the sewage beds.

A fairly straight brook that drains a narrow basin heading in the own of Rocky Hill enters Berlin near its northeast corner and joins the Mattabesset where that river turns from an easterly to a southerly course. The lower mile of this brook has a fairly uniform and steep grade, the fall being nearly 100 feet. Its narrow basin is only 2½ miles long, and its average flow is less than 1 second-foot. Two other streams of about the same size enter the Mattabesset from the Berlin side. One of these streams heads in Middletown on the northeast slope of Lamentation Mountain, flows first northward through a large marshy area between the villages of Berlin and East Berlin, then swings eastward and joins the Mattabesset opposite the Rocky Hill-Cromwell town line. The other stream drains the lower slopes east of Lamentation Mountain and only the lower half mile of its course is in Berlin. It joins the Mattabesset 300 or 400 yards above the Berlin-Middletown town line.

In the southern part of Berlin much of the drainage of the Mattabesset is collected in three reservoirs—Merimere, Hallmere, and Kenmere—for the water supply of the city of Meriden.

Harts Ponds in the northwest and a large pond in the southeast portion of Berlin are in part formed by dams. Ice is harvested from the southeastern pond in winter, but Harts Ponds serve chiefly as storage supplies for the mill ponds farther downstream. Chief of these ponds is that of the American Paper Goods Co., a mile southwest of Berlin station, and a newer pond that is formed by another dam half a mile below.

GEOLOGY.

The Triassic bedrock in the town of Berlin has been greatly displaced from its original position by extensive faulting. The blocks between the fault zones, which trend generally northeast, have been tilted eastward or southeastward at angles of 10° to 20° from the horizontal. The several blocks have also been offset by movements that have in general shoved the rocks on the western side of each fault southward with respect to the rocks on the eastern side. This extensive faulting has brought to the surface the broken edges of the three trap sheets in the manner shown in the cross sections C–D and E–F of Plate III (in pocket).

The rock of the "Anterior" or lower trap sheet has been brought to the surface only near the southeast corner of the town and at one place on its west border. In these places the "Anterior" trap forms only a few small exposures, as is indicated in Plate II (in pocket). The main trap sheet is well exposed in several cliffs in the southern and western portions of the town and also forms the bedrock beneath considerable areas in those portions. (See Pl. III.) The "Posterior" or upper trap sheet has been brought to the surface and forms several bands or zones in the northern and northeastern portions of the town. Three or four of the bands formed by this trap sheet are low but distinct ridges, but the others are so inconspicuous that the courses of the broken edges of the trap sheet are very largely hidden by the overlying glacial deposits.

The beds of sandstone with which the trap sheets are associated have been so displaced from their original position that the "Posterior" sandstone (which underlies the "Posterior" trap sheet) and also the sandstones beneath the other trap sheets, now form the uppermost rock beneath considerable parts of the town, although the original upper sandstone remains as the uppermost rock beneath most of the northeast part of the town. In deep drilling in the areas where the upper sandstone forms the uppermost rock the entire series of sandstones and three trap sheets would therefore be penetrated if the drill hole were continued to sufficient depth.

In the lower lands of the town, which are along the valley of Mattabesset River and its main tributaries, the bedrock is overlain by stratified glacial drift, as shown in Plate II (in pocket). Beds of brick clay are found in these deposits along the Mattabesset and appear to have been laid down in a lake that occupied the river valley for some time after the retreat of the Pleistocene ice.[1]

In a few places the stratified drift forms characteristic features other than flat lowland areas. In the lowland one-half mile to 1 mile southwest of Beckley there is a long, narrow curved ridge or esker (Pl. VI, *A*) composed of sand and gravel that was deposited along the course of a glacial stream that flowed beneath the ice sheet. A small area 1½ miles southeast of Turkey Hill and a few hundred yards west of the railroad contains several depressions that are probably kettle holes, formed by the melting of great blocks of ice that were left with other glacial débris as the main ice front melted and retreated northward.

The higher lands, which form the greater part of the town, are overlain by glacial till. On the higher slopes this loose material is

[1] Loughlin, G. F., The clays and clay industries of Connecticut: Connecticut Geol. and Nat. Hist. Survey Bull. 4, p. 24, 1905.

in many places very thin, however, and the underlying rock, which is chiefly trap on these slopes, is laid bare at numerous points.

Distinct evidences of glaciation are shown by glacial scratches at several places on the exposed rock surfaces, both in the ridges and in the lower rolling hills. A number of the lower hills are also rounded and elongated in a general northerly direction and are probably drumlins or masses of till (unstratified glacial drift), which were formed beneath the ice sheet in somewhat the same way that sand bars are formed in sluggish streams.

WATER SUPPLIES.

Surface water.—In the southern part of the town of Berlin a few families near the Meriden water main from Kenmere to Elmere reservoirs obtain domestic supplies from that source. In 1914 in the village of Berlin 113 customers were supplied by a line extending southward from the New Britain Water Co.s system.[1]

The Berlin Water Co., organized about 1912, has planned to supply the village of Berlin with water pumped from Mattabesset River, but in the summer of 1917 construction on its system had not been begun.

Except for the families in Berlin village that are supplied by the New Britain Water Co., and those in the southern portion of the town that are supplied from the Meriden main, the people of the town of Berlin depend for water on individual wells, though a few of them obtain their supplies from springs.

Water in stratified drift.—By far the greater number of wells in Berlin are dug in the unconsolidated glacial deposits. Relatively few wells have been dug or drilled into the underlying rocks. The deposits of stratified drift occupy most of the lowland areas in the town, and also cover some of the adjacent hillsides, as is shown in Plate II (in pocket). Of the 87 dug wells[2] in the town that obtain water from the glacial deposits. 35 are in the stratified drift, and although some of them get low and even fail completely during the later part of the summer, they furnish water at relatively shallow depths during most of the year. The depth of the wells differs considerably, the maximum that was noted being 43 feet in well 105 early in May, 1915. The depth of water in the wells ending in stratified drift that were measured in this town differs markedly according to the topographic position, and, as is shown in figure 3 (p. 16), the ground water stands about twice as deep on the hillsides as in the lowlands. The average depth to water in the three wells examined on hilltops was

---

[1] Connecticut Public Utilities Commission Rept., 1914, p. 661.

[2] Wells 33 and 56 are omitted from this enumeration, as they obtain water from the underlying sandstone.

over three times as great as in the lowland wells. In one lowland well (No. 41), however, the depth to water was greater than in two of the hilltop wells. The analysis of the water of the deepest recorded hilltop well in drift (well 20, p. 32) shows it to be a water of moderate concentration, in which calcium and bicarbonate predominate, making it a moderately hard water for this area, although the amount is not excessive and No. 107 is the only Berlin water analyzed that contains less hardening constituents.

The detached area of stratified drift in the vicinity of Harts Ponds (see Pl. II, in pocket) is thin, and although water is obtained at shallow depths, the wells are liable to fail in summer. The stratified drift in the valley of Belcher Brook and in the stream valley between Berlin and East Berlin is also rather thin, and some of the dug wells in these localities likewise fail. In the lowland north of Mattabesset River there are extensive deposits of clay, and dug wells there do not obtain satisfactory supplies of water.

On the south side of the Mattabesset near the mouth of Belcher Brook, dug wells obtain more reliable supplies of water, for the drift there is more sandy. Large quantities of ground water probably can be developed in this locality by shallow wells drilled or bored to the bottom of the principal water-bearing strata. Wells sunk in this area should be cased to keep out fine sand, and properly screened to allow the rapid inflow of water. Ample supplies of water of good quality for domestic consumption and industrial use could probably be thus developed in this lowland area at a relatively small cost for the neighboring communities of Kensington, Berlin station, and Berlin. Below Beckley the stratified drift is clayey, and consequently good supplies of water are not so commonly obtained there as near the mouth of Belcher Brook.

Water in till.—The greater part of the town of Berlin is covered with glacial till. Over the higher lands the till is too thin to serve as a water-bearing formation, however, and both the underlying trap and the sandstone are exposed in many places. (See Pl. II, in pocket.) The average depth to water in the 52 till wells that were measured was 14.5 feet, or practically the same as in the 35 wells in stratified drift. (See fig. 3, p. 16.) The average depth to water in the wells in till on hills and slopes was noticeably less than in wells in stratified drift in the same topographic positions, however. In the lowlands, on the contrary, the average depth to water was nearly 50 per cent greater in the wells in till than in the wells in stratified drift.

The analyses of water from dug wells 51, 85 (p. 30), and 107 (p. 31), the first two being hilltop wells in till and the last on a slope in the same material, illustrate the marked differences in character in well waters obtained from the till. The water from well 51 is a moderately hard calcium-carbonate water, whereas that from well 107 is unusually free from mineral salts in solution. The high content of calcium, magnesium, and bicarbonate in the water from well 85 shows that it is a very hard water for this area. This well is in a barnyard, and the unusually large amounts of chloride and nitrate indicate that the water is contaminated by the barnyard wastes.

Water in sandstone and trap.—Records were obtained of the water level in only 13 drilled wells in Berlin. These wells range in depth from 50 to 300 feet, the average depth being 120 feet. Most of these wells are drilled into the sandstone and obtain dependable supplies of water sufficient for domestic use. Well 23, however, which is drilled at a brickyard in the lowland near Beckley, probably is sunk its entire depth in the stratified drift and obtains its water from a sandy layer below the clay deposits. Trap was penetrated in wells 46 and 77, but their main water supplies are from the overlying sandstone. Well 70 is of unusual character, as it has an artesian flow. Its natural yield of 100 gallons a minute is much larger than is usually obtained from drilled wells. The trap rock of the posterior sheet is exposed near the well, and the bottom of the well, which is reported to be 117 feet deep, may be a short distance below the bottom of the trap sheet, and the artesian flow may come from the sandstone beneath the nearly impervious trap rock.

The analyses of water from drilled wells 31, 46, and 83 (p. 32) show them to be waters of moderate concentration, in which calcium and bicarbonate, the usual constituents in this region, predominate. The water from well 83 is notable for its high content of sulphate in addition to bicarbonate. It is a rather hard water, but the low content of chloride and the absence of nitrate indicate that it is probably free from contamination. In this respect it is a better water than many others in the town.

Springs.—Only five springs were noticed in the town, and only one of these was used as a domestic supply. Three of the springs issue directly from sandstone. The other two issue from the glacial deposits that overlie the sandstone, but possibly have their principal source also in the water that is stored in crevices in the sandstone. All are of small but perennial flow.

RECORDS OF WELLS AND SPRINGS.

The locations of a number of wells, scattered throughout the town, are indicated on Plate II (in pocket), together with the depth to water in each early in May, 1915. Additional data concerning these wells and the springs that were noticed are given in the following tables and their discussion. The depth to water in the wells listed, and the relative capacity and permanence of their supplies, are believed to be typical of the many other wells in the town.

CROMWELL.

HISTORICAL SKETCH.

The town of Cromwell forms a rudely triangular area that is bounded on the east by Connecticut River and on the west by Mattabesset River. On the north a straight boundary line separates Cromwell from the town of Rocky Hill.

The first settlement within the limits of the present town was in 1650, when several families from the vicinity of the present city of Middletown moved to the lowland along Connecticut River near the mouth of the Mattabesset, which was early known as Little River. Provision in the allotment of land was originally made for only 15 families, but in 1670 there were 52 families in the locality. In 1704 the settlement, which had become known as Upper Houses, was organized as Upper Middletown parish. The parish remained a portion of Middletown until 1851, when it was incorporated and named after Oliver Cromwell as a separate town, with its present boundaries.

One post office, at the village of Cromwell, supplies the present needs of the town, as the population is largely concentrated at this village in the southeast, near Connecticut River. North Cromwell, a mile away, is a separate community, though homes are closely spaced along the main highway northward from Cromwell village.

In the western part of the town a small community has grown up, about half a mile northwest of Westfield station, but in the main the houses in the western portion of the town are scattered.

The Valley division of the New York, New Haven & Hartford Railroad passes along the eastern border of the town and through the village of Cromwell. A trolley line extending northward from Middletown parallels the railroad to Cromwell village and thence continues northward along the main highway. The western border of the town is crossed by the trolley line between Middletown and Berlin station.

The area of the town, taking the middle of Connecticut River as its eastern boundary, is about 8,700 acres, according to planimeter measurement on the Middletown topographic map, but 400 acres of this total is the water surface of Connecticut River.[1] The lower course of Mattabesset River is affected by the tide and adds perhaps 20 acres to the total water surface, and half a dozen small ponds add about 20 acres more.

A wide lowland area along Mattabesset River and a smaller area beside Connecticut River comprise a total of fully 600 acres of marsh land, or 7 per cent of the total area of the town.

Originally the town was very largely wooded, in the lowlands as well as in the hilly portions. From the greater part the timber was long ago removed for fuel and for building, but a large acreage in the northeast is still covered with second and later growths. Numerous small wood lots (see Pl. IV, in pocket) increase the total woodland to about 1,850 acres, or fully 21 per cent of the entire area.

POPULATION AND INDUSTRIES.

Early records of the population of Middle Houses are included in those of Middletown, so that definite figures of the growth of the newer settlement do not seem to be available. It is known, however, that from a population of about 250 in 1704, when the parish was formed, Middle Houses increased to a total of 754 persons in 1776.[2] During the first half of the nineteenth century commerce with the West Indies afforded a substantial industry and growth. In 1850 the proposed town of Cromwell had a population of 1,275, and in the succeeding 20 years the town's population increased nearly 50 per cent. From 1870 to 1880 there was a notable loss, owing to migration to neighboring towns where manufacturing was being more

[1] The area is given as 8,455 acres in the Connecticut State Register and Manual, p. 419, 1915.

[2] Adams, J. C., History of Middletown Upper Houses, p. 57, New York, 1908.

actively developed and to the movement of farmers to lands farther west. A considerable increase in population was attained during the next 10 years, however, and since 1890 there has been a slow but fairly uniform growth. The available records of population of the area embraced by the present town are shown in figure 5.

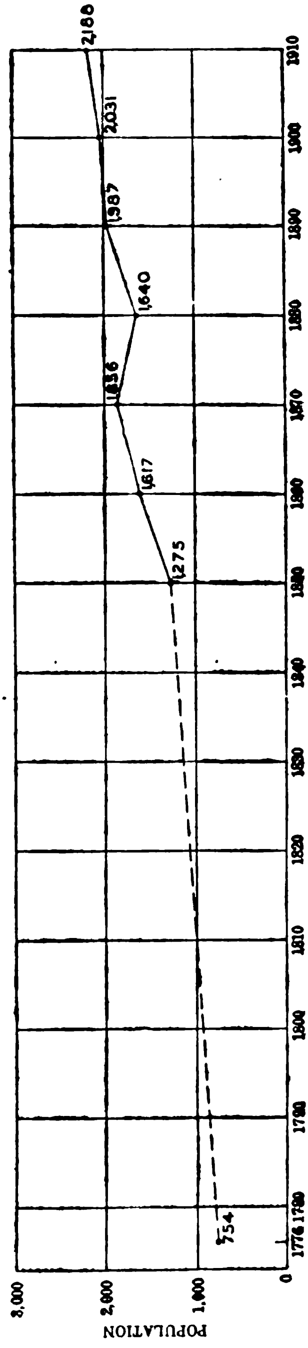

FIGURE 5.—Curve showing population of the town of Cromwell, Conn.

The principal industry in the town is agriculture. Hay and corn are the main crops, but much tobacco is grown in the northeast. A number of dairy farms have also been established within recent years at scattered points throughout the town. Employment to a number of people in the town is afforded by a few long-established factories, the principal ones being a factory for toys and light hardware and a hammer works. Within recent years extensive greenhouses near Cromwell village have also given local employment.

GEOLOGY.

Faulting, which has produced complex structure in the rock formations in Berlin, is not so pronounced in Cromwell, and the upper sandstone is the first rock penetrated in by far the greater portion of the town. The western part of the town is traversed by at least four faults, however, and the "Posterior" or upper trap sheet has thus been brought to the surface. The areas immediately underlain by this trap have been painstakingly worked out by Davis,[1] as is shown on Plate III (in pocket), but the trap rock is actually exposed at only a few places, as indicated on Plate II (in pocket). The great fault that passes between Lamentation and Higby mountains extends northeastward through Cromwell, but in this town the displacement of the rocks along the fault has been sufficient to bring the upper trap sheet to the surface only near the

[1] Davis, W. M., The Triassic formation of Connecticut: U. S. Geol. Survey Eighteenth Ann. Rept., pt. 2, pl. 19, 1898.

southern border of the town. Farther north, although the displacement of the beds is several hundred feet, the upper sandstone forms the rock immediately underlying the trap on each side of the fault. In the western part of the town an extensive fault west of the belt of upper trap rock has brought beds of the "Posterior" sandstone along its eastern side up into juxtaposition with beds of the upper sandstone along its western side. Deep wells drilled between this fault and the belt of trap rock will therefore penetrate the main trap sheet as the first trap, whereas deep wells drilled west of the fault will first penetrate the upper trap sheet. The approximate position of the several trap sheets and sandstone formations beneath the town of Cromwell is shown in the structure section C–D on Plate III (in pocket).

The lowlands along Connecticut and Mattabesset rivers are covered by stratified glacial drift. The central and northeastern portions of the town are also covered by sandy stratified deposits, which are believed to have been spread out as a plain by water from the glacial ice front at a period when ice that still lingered farther south partly dammed up the valleys of Mattabesset River and of Connecticut River near Middletown.[1] Over the sand plain and in the marsh lands along the Mattabesset and the Connecticut, the drift is probably deep, but on the western border of Cromwell village the underlying sandstone is exposed in a large abandoned quarry. Other outcrops of the sandstone in the vicinity show that the drift is only a few feet thick on the slopes near Cromwell village, and the rock has also been exposed in trenches dug for water mains.

The higher portions of the town are formed by rounded hills that are covered by glacial till and are probably, in part at least, molded into drumlin forms by thick layers of the glacial débris. In one locality in the northwest the covering of till is very thin, however, and numerous ledges of sandstone are exposed.

SURFACE FEATURES.

The central and northwestern portions of the town constitute a hilly area whose greatest elevation is reached in a hilltop in the northwest, nearly 300 feet above sea level. A number of other hills are more than 200 feet high, but the area is deeply incised by several streams, and the slopes also drop rapidly to the west and south to Mattabesset River.

In the northeastern portion of the town lies a sand plain that has a mean elevation of about 180 feet, but it has been dissected from the north and from the south by the headwaters of minor streams. On the east the plain drops rapidly to Connecticut River. On the south-

[1] Loughlin, G. F., The clays and clay industries of Connecticut: Connecticut Geol. and Nat. Hist. Survey Bull. 4, p. 24, 1905.

east the surface slopes down to a wide expanse of lowland extending to the river.

The southeast corner of the town is occupied by an extensive marsh land between the Connecticut and the Mattabesset, and this marsh extends up the Mattabesset for nearly 3 miles above its mouth. Connecticut River along the entire eastern side of the town and the Mattabesset to at least the upper limit of the marsh land are within the influence of the tide. All the lowlands of the town are therefore only slightly above sea level.

Most of the hilltops and adjacent slopes have long been cultivated, and only detached areas of woodland remain in the central and western portions of the town. The largest remaining wooded areas are along stream valleys on the northern border, and on the slopes from the sand plain down to the Connecticut.

STREAMS.

Connecticut River has a fairly uniform width of about a quarter of a mile where it forms the eastern boundary of Cromwell. It is navigable from its mouth to the city of Hartford, 15 miles above Cromwell village, and formerly was the principal means of transportation for the region. Since the construction of railroads, however, the river transportation has became of minor importance.

The eastern portion of the town drains fairly directly to Connecticut River through a few small brooks. Dividend Brook, which has its course mainly in Rocky Hill, swings southward and then sharply northeastward to the Connecticut. The southernmost part of its course crosses the Rocky Hill-Cromwell boundary and drains the northeastern border of Cromwell. Its average flow at the road crossing at the southernmost point of its course is probably less than 1 second-foot. On May 6, 1915, it carried 0.6 second-foot of water.

A small tributary that parallels the north border of the town has been locally called Peat Swamp Brook. Peaty deposits in its marsh-land course were intermittently prospected for many years, but the material does not seem to be of commercial value.

A smaller perennial stream drains a portion of the eastern slopes of the town directly to the river.

The greater part of the sand plain in the north-central part of the town is drained by a brook that flows southeastward through North Cromwell village to the Connecticut. In its upper portion this stream is ponded in three places, the upper two ponds regulating the flow to the lowest, which furnishes power to one or more factories. Below North Cromwell the brook flows for nearly a mile across the lowland to Connecticut River. Because of the several ponds and the mill dam at and above North Cromwell a satisfactory estimate of the normal flow of the brook was not obtained. It seems, however, to have a considerably larger discharge per unit drainage area than Dividend Brook. Its upper course is intrenched 60 feet or more in the sand plain, hence it probably receives considerable water by seepage inflow from the deep sandy deposits and perhaps also by springs that issue close to its channel.

The southern and western portions of the town are drained by a number of small brooks that flow directly to Mattabesset River, which forms the town boundary on the south and west. The Mattabesset itself is affected by the tide for half its course along the Cromwell border. Above the limit of the tide it is a sluggish stream, so polluted by factory wastes and sewage that few fish inhabit it. Its average flow during the low water of summer and autumn is about 50 second-feet at the northwest corner of the town. Half a mile above its mouth it is joined from the south by Coginchaug River, and it enters the Connecticut with a mean low-water discharge of about 70 second feet.[1] The stream receives a normal low-water accession of only about 2 second-feet between the northwest corner of Cromwell and the mouth of the Coginchaug. Several of the individual brooks that enter this portion of the Mattabesset both from the south and from the north at times carry more than 2 second-feet, however. On May 5, 1915, the brook that enters the north side of the Mattabesset one-third of a mile west of Westfield station had a discharge of 3.7 second-feet, at a time when the Mattabesset shortly above the mouth of this brook carried 42 second-feet.

The brooks that drain the southern and western slopes of Cromwell are at present almost unused for the development of power, but in former times the largest ones were of some importance for this purpose. A grant to a mill site on Chestnut Brook[2] was obtained in 1655, but of late years this stream has been used little if at all for the development of power.

WATER SUPPLIES.

Surface water.—A few years ago a pumping plant was established shortly below the power dam at North Cromwell, and water from the brook was delivered to consumers in Cromwell village. In 1915 this plant, owned by the Cromwell Water Co., a private corporation, comprised an electrically driven centrifugal pump, lifting water from the brook below the power dam to two standpipes in the highest part of the village. (See Pl. IV, in pocket.) The distribution system comprised 8 miles of mains. The pump was run three to eight hours each night to supply the average daily use of about 175,000 gallons.

[1] Report on the investigation of the pollution of streams, p. 45, Connecticut State Board of Health, 1915.

[2] Adams, J. C., Middletown Upper Houses, p. 15, New York, 1908.

In 1915 the Cromwell Water Co. supplied about [illegible]00 people,[1] or about two-thirds of the population of the town. The remaining third, scattered throughout the town, depend chiefly on shallow dug wells for water supply. A few drilled wells have been put down in the western part of the town in places where the glacial material is thin, and a few springs are used.

Water in stratified drift.—As the greater part of Cromwell is covered by stratified drift, most of the dug wells obtain water from this material. The average depth to water in the 23 wells in stratified deposits that were measured early in May, 1915, was 12.5 feet. The water level differed greatly in the individual wells, but as shown in figure 5 (p. [illegible]) the average depth on hills, slopes, or lowlands in the stratified drift did not differ greatly. In general the depth to water in the eastern part of the sand plain that occupies the north-central part of the town was greater than in the western portion of the plain and indicated a marked eastward slope of the water table, caused, presumably, by the deeply intrenched drainage course of the brook that flows through North Cromwell. Although the wells in the sand plain obtain ample supplies of water for individual families, the greatest available supplies of ground water in the town are probably stored in the lowland east of Cromwell village and in the more marshy land in the southeast corner of the town. Wells were not seen in either area, and no test borings were reported which might show the character of the stratified drift in either place. It is probable that the lowland along the Mattabesset is underlain by clay beds similar to those of the brick-clay pits near Newfield, and hence large yields of water could not be obtained from wells sunk in these lowlands. The area east of Cromwell village is, however, probably underlain by more sandy material, in which there may be large supplies of water that could be developed by shallow wells and pumping plants for the use of neighboring industrial establishments.

Analyses of water from three dug wells in the stratified drift (see table, p. 40) show that some of the wells, of which Nos. 6 and 7 are examples, yield very soft and pure water. Other domestic wells, however, which are situated adjacent to kitchens or to outhouses may become dangerously polluted by organic wastes, resulting in abnormally high amounts of chloride and nitrate. Well 41 is an example of such a well; the chloride and nitrate radicles constitute more than half of the total solids, which they have increased to an extent that is abnormal for this area.

Water in till.—The records of 10 dug wells in the till, chiefly in the western portion of the town, indicate that the water level is there on an average about three-quarters as deep as in the stratified drift of the lower areas. There is, however, as marked a variation in the

---

[1] Connecticut Public Utilities Commission Rept. 1915, p. 649.

water level in individual wells in till as there is in the wells in stratified drift.

Water in sandstone.—Four drilled wells were observed in the town. All are in the western part, in localities where the glacial drift is too thin to serve as a reliable water-bearing formation. The wells are drilled 63 to 142 feet deep, the depth to water in them being 20 to 30 feet in May, 1915. In the deepest well (No. 26) the "Posterior" trap sheet was drilled through and a dependable water supply was obtained from the underlying sandstone. In the other three wells only sandstone was penetrated below the till.

Springs.—Three of the four springs noticed in the town are used for domestic supply. Each of these three springs issues from the stratified drift and yields only about half a gallon a minute, but each is said to have a perennial flow. The fourth spring issues from the trap in a small road-metal quarry and supplies a roadside trough.

RECORDS OF WELLS AND SPRINGS.

The wells and springs indicated on Plate II (in pocket) and tabulated in the following list are believed to be typical and to show the ground-water conditions in different portions of the town.

MERIDEN.

HISTORICAL SKETCH.

The town of Meriden occupies the southwestern part of the area considered in this report. The area was first organized as a parish of the town of Wallingford, which adjoins Meriden on the south.

The parish is generally considered to have been named from Meriden, in Warwickshire, England, but doubt as to this source of the name has been raised in favor of a farm near Dorking, in Surrey County, England.[1]

In 1730 the population of the parish was only about 250, for immigration was not rapid, and after the French and Indian War migration was westward rather than into the Meriden region. By the close of the American Revolution the population of the parish of Meriden was probably about 500, and in 1806, when the settlement was incorporated as a separate town, it contained about 1,100 people.[2] The present population is concentrated in the center of the town, in the city of Meriden, which was chartered in 1867. South Meriden and East Meriden are communities about a mile beyond the corporate limits of the city.

The area of the town is close to 15,000 acres, according to planimeter measurement on the Meriden and Middletown topographic maps.[3] Nearly 24 per cent of the total area is wooded (see Pl. IV, in pocket) with small second and later growths of chestnut, oak, maple, and other native trees. There is only about 200 acres of marshland in the town, and this land consists largely of strips along the principal brooks. Nearly 300 acres, or 2 per cent of the total area, is covered by the water surfaces of several ponds.

POPULATION AND INDUSTRIES.

During the first few decades after incorporation Meriden gained only slowly in population. The development of manufactures, which were early started in and near the city, soon gave impetus to settlement, however, and between 1840 and 1850 the population nearly doubled. An even greater increase took place in the succeeding decade, and since 1860 the growth has continued at a rapid rate, Meriden being now one of the most important manufacturing cities in the State. The accompanying diagram (fig. 6) shows the growth in population of the town since its incorporation, and of the city since 1880, when the population of the city as distinct from the town first appears in the census reports.

The principal industry of Meriden is the manufacture of sterling silverware and plated ware, on which account it is sometimes called the "silver city." Other important industries are the manufacture of nickel and granite ware, of Britannia ware, cut glass, electric and other lamps, clocks, furniture trimmings, and many minor articles. Cutlery and other small articles are made at South Meriden, and several small factories are located in East Meriden

---

[1] Curtis, G. M., and Gillespie, C. B., A century of Meriden, p. 46, Meriden, 1906.

[2] Idem, p. 333.

[3] The area of 10,483 acres, given on p. 432 of the Connecticut State Register and Manual, 1915, is evidently in error.

The rolling slopes outside the city are extensively cultivated, field crops being raised chiefly, though there are numerous small orchards of apples and other deciduous fruits.

The double-track line of the New York, New Haven & Hartford Railroad passes through the city of Meriden and gives easy access both to New Haven, on tidewater, 18 miles to the south, and to Hartford, the State capital, at the head of navigation on Connecticut River, 18 miles to the north. Interurban trolley lines connect Meriden with villages to the east and to the west, and the principal

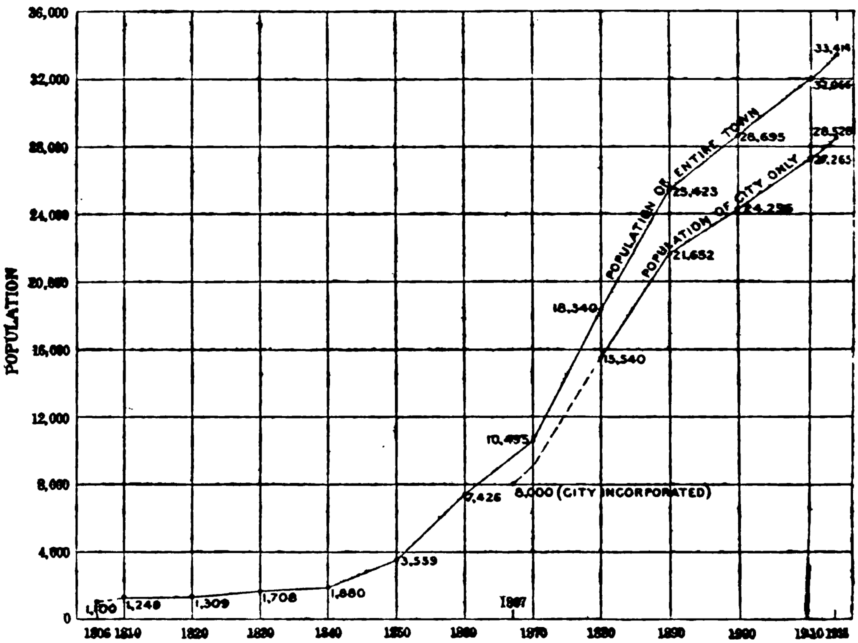

FIGURE 6.—Curves showing population of the town and city of Meriden, Conn.

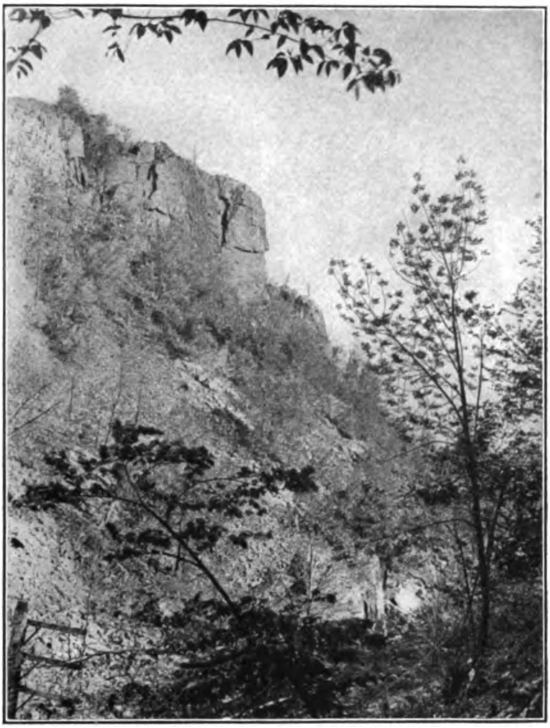
highways are either concreted or metaled, affording easy means of communication by automobile.

GEOLOGY.

The geologic structure in the town of Meriden is largely determined by two extensive faults that cross it in a northeast-southwest direction. (See Pl. III, in pocket.) Of these major faults the western one is believed to have caused a displacement of not less than 2,000 feet and the eastern one of not less than 1,300 feet.[1] Along these two great fault zones uplift and offset of the rocks has taken place and the "Main" trap sheet has been broken and

[1] Davis, W. M., The Triassic formation of Connecticut: U. S. Geol. Survey Eighteenth Ann. Rept., pt. 2, p. 96, 1898.



A. CLIFF OF TRAP IN CATHOLE GORGE, MERIDEN, CONN.

B. BOULDER-STREWN FIELD NEAR HARBOR BROOK, MERIDEN, CONN.

uptilted, so that its edges now form the cliffs of Hanging Hills, Lamentation Mountain, and the Higby-Beseck mountain mass. A near view of one of these cliffs is shown in Plate VII, *A*. The manner in which repeated faulting has caused the "Main" trap sheet to form the extensive cliffs of the Hanging Hills is shown in the structure section E–F on Plate III. The uplift was so great that the "Anterior" or lower trap sheet is also exposed along the bases of the mountains, as shown on Plate III. This lower trap sheet forms a prominent shelf or bench below the main cliffs of the Hanging Hills, as shown in Plate V, *A*. At the base of Lamentation Mountain it also forms a minor ridge, but along Higby and Beseck mountains it does not appreciably affect the topography. The apparent secondary bench of Beseck Mountain, south of Black Pond, that is shown in Plate V, *B*, is a more distant portion of the cliff formed by the "Main" trap sheet.

In the northern and eastern portions of Meriden the successive rock formations from the lower sandstone upward to the "Main" trap sheet are exposed. The lower sandstone is the uppermost rock in the greater part of the town, and in drilling wells in these areas, except for the remote possibility of penetrating a dike, no trap rock will be met. One dike of diabase rock, which is similar to the trap rock of the several sheets, is exposed at several points south of Meriden, but it is believed to be the only dike of note in the region. A small dike near Baileyville, in Middlefield, has been described by Griswold.[1] The northernmost exposure of this dike that was noticed is in the unpaved roadway of Prospect Halls Avenue. The dike there appears to be only 2 or 3 feet wide, but half a mile southward, in the western portion of Walnut Grove Cemetery, it has a width of 15 feet or more. At this locality it is best exposed in a small quarry or pit, which is probably the Golden Parlor mine, where prospecting for copper was carried on many years ago. Farther south the dike rock is well exposed as a very low rocky ridge. Its surface exposures terminate at a road cut, 4 feet deep, where the dike is about 40 feet wide. The eastern contact between the dike and the sandstone is well shown in this cut.

The lands along the principal streams in the town are covered by stratified drift. The bedded character of this material is shown in numerous gravel banks, such as the one illustrated in Plate VI, *B*. Well records show that in many places this drift is shallow, but along the lower course of Harbor Brook the deposits are deep. Through the center of the city of Meriden the western border of the lowland along Harbor Brook is probably marked by a steep, buried bedrock slope; for it is said that whereas the western portion of Winthrop

[1] Griswold, L. S., A basic dike in the Connecticut Triassic: Harvard Coll. Mus. Comp. Zool. Bull., vol. 16, pp. 239–242, 1893.

Hotel is built on sandstone, the eastern portion rests on piles driven into unconsolidated materials.

South Meriden is situated on a sand plain that extends from Quinnipiac River westward to the hills that limit the river valley and southward down the river valley for several miles. This plain was probably formed by the reassorting and redeposition of sand and finer materials by water that was produced by the melting of the glacial ice and that spread over the valley before a definite channel had been established. In these porous sand-plain deposits the city of Meriden has constructed very successful filter beds a short distance below the town line.

In the southeastern portion of the town there is a low but well-developed esker in the upper part of the valley of Harbor Brook. A road makes use of this low, narrow ridge, which forms a well-drained thoroughfare through the meadow land on each side.

Rolling hills occupy considerable portions of the town. Most of these hills are elongated in a uniform direction east of north. They are drumlins, but around their bases and even on some of the higher slopes the till is very thin. Unstratified material also occupies some of the lower lands and in the lee of the prominent trap ridges occasionally forms boulder-covered areas, like that shown in Plate VII, *B*. In numerous places, especially in road cuts, the underlying sandstone is well exposed for distances ranging from a few yards to several rods. The observed areas of such exposures are necessarily exaggerated on Plate II, in order that they may be shown on the map. Doubtless the sandstone is exposed in many other places that were not seen by the writer.

SURFACE FEATURES.

The highest points in the town, and by far the most prominent elevations in the central lowland of Connecticut, are the Hanging Hills, which reach a maximum elevation of 1,007 feet in West Peak, on the northwest border. East Peak, on which an observation tower 38 feet high has been erected, and South Mountain and Cathole Mountain, farther east, are also prominent though lower summits of the Hanging Hills. In the northeast part of the town Lamentation Mountain proper and its southern extension, known as Chauncy Peak, also form prominent cliff-bordered masses. These higher areas are practically all wooded and have the usual second and later growths of the native trees.

The central portion of the town comprises a belt of lowland extending from the headwaters of small streams in the northeast to the valley of Quinnipiac River in the southwest, the lowest point in the town being where this stream crosses the southern border, at an elevation of about 55 feet.

The lowland of the town is bordered on each side by rolling hills, which form the greater part of the surface.

STREAMS.

Quinnipiac River enters the town of Meriden through a gorge cut 200 feet deep in sandstone and crosses the southwest portion of the town, receiving the drainage from nearly all of it. In its upper portion the stream is used for power development at a number of places, and at South Meriden the Meriden Cutlery Co. obtains power at the outlet of Hanover Pond, a water body of about 35 acres that is formed chiefly by a dam across the river. Mr. Harold T. Burgess, civil engineer, of Meriden, has furnished the curve of discharge of the river at the outlet of Hanover Pond, which is presented in figure 7.

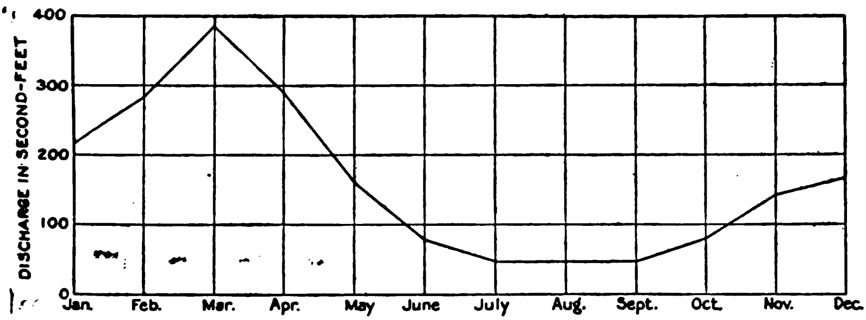


FIGURE 7.—Diagram showing monthly discharge of Quinnipiac River at outlet of Hanover Pond, Meriden, Conn.

This record shows that the maximum flow, which is usually attained in March, is about eight times the minimum flow of the summer months. Storage ponds, however, regulate the flow of the stream sufficiently to make it fairly dependable for the development of power throughout the year.

Harbor Brook, which empties into Hanover Pond, drains the eastern part of Meriden through its North Branch, which heads in marsh land at the base of Chauncy Peak, and through its other branches it drains the southeastern part of the town. In their upper portions these streams are fairly pure, and shortly below their junction they supply a chain of ice ponds, but below these ponds the main stream flows through the city of Meriden and is polluted by factory wastes. The daily flow of the stream is affected by the opening and closing of the pond gates, but the average discharge into Hanover Pond is probably about 10 second-feet.

Cathole Brook drains the slopes on each side of the mountain of the same name, and flows southward through a small valley. Its western branch has been dammed and a small pond has been formed at the entrance to Cathole Gorge. This branch normally carries perhaps 1 second-foot of water, and the main or eastern branch carries somewhat more. About 1 mile above Hanover Pond Cathole Brook joins Sodom Brook, which heads in the slopes of South Mountain. Shortly below the junction of these two streams Crow Hollow Brook, which heads near the base of West Peak, also enters, and the combined discharge into Hanover Pond averages perhaps 5 second-feet of water.

Meetinghouse Brook and its tributary Spruce Dale Brook are small streams that drain a southern portion of the town southward to the Quinnipiac.

WATER SUPPLIES.

Surface water.—The municipal water supply of the city of Meriden is furnished by several reservoirs, which are shown on Plate IV (in pocket). Merimere reservoir, which was constructed in 1888 in the gap between East Peak and South Mountain, has an available capacity of about 341,000,000 gallons and furnishes a gravity water supply. Kenmere reservoir was later built on another stream, and the water is being pumped from it to Elmere distributing reservoir. In 1895 Hallmere reservoir was constructed, higher up on the same stream, for storage of water. Excess water from Elmere reservoir is also diverted into Hallmere reservoir by a ditch across the low divide between the two drainage courses. With the rapid growth of the city the reservoir supply has proved inadequate during the late summer, and emergency pumping stations at Hanover Pond (Hanmere station) and at Baldwin Pond (Baldmere station) have been used for short periods. The quality of the water from these two ponds is poor, however, and in order to provide for a better and more adequate supply, Broad Brook reservoir, in the town of Cheshire, was constructed in 1915. This reservoir has a capacity of 1,200,000,000 gallons. From it the water is lifted by electrically driven centrifugal pumps to a distributing reservoir on Johnson Hill. Thence the water is supplied to the mains by gravity under a head of about 250 feet in the business section of the city. Pollution of this new supply has been guarded against by the purchase of farms adjacent to the reservoir and the removal of the buildings.

In excavating for the foundations of the Broad Brook dam well-preserved glacial scratches were found on the sandstone underlying the till. An average thickness of 28 feet of sandstone was removed until diabase was reached, evidently dike material, containing copper stains. This rock was uncovered at a depth of about 44 feet, entirely across the dam site. Similar dikes a few miles to the south have long been prospected for minerals.

In addition to the people within the city limits, a few families in the northern part of the town of Meriden and in the southern part of Berlin, near whose houses the city mains pass, are supplied with water from this system.

Several industrial establishments in the city have sunk wells to supply their factories. These wells have been only partly successful, however, for the water obtained is too hard to be satisfactory for boiler use, and the factories depend on the city supply for water for this purpose.

The community of East Meriden and the numerous farmhouses throughout the town depend on individual wells for a water supply.

Water in stratified drift.—Only a small part of the town of Meriden is covered by stratified drift and only 11 of the 55 dug wells observed that obtain water from the glacial materials are sunk in stratified drift. Wells 6, 9, 26, 35, and 106 obtain water from the sandstone, and hence are not included in the present discussion. The average depth to water in the 11 wells in stratified drift was 15 feet early in May, 1915, but the water level in the several wells ranged from 7 to 24 feet. (See fig. 3, p. 16.) The stratified drift along the stream valleys above Hanover Pond seems from the available records neither to be very deep nor to contain extensive layers of good water-bearing sand and gravel. In the plain south of Hanover Pond, however, the stratified drift seems to contain extensive water-bearing layers of sand, and ground-water development on a large scale in the town could probably be best undertaken in this lowland. The Meriden sewage beds discharge into the sand a short distance south of the town line, but it is not probable that the effluent seeps northward and contaminates the beds within the town of Meriden.

The average depth to water in the 44 wells in till that were measured was nearly 2 feet greater than in the wells in drift, being 16.7 feet as compared with 15 feet, and a greater range in depth was also found in the wells in till. Both the least depth (1 foot) and the greatest depth (43 feet) to water in dug wells were noted in wells in till on the hillsides.

Water in sandstone.—A large proportion of the dug wells fail in summer, and hence of late years many of them are being improved by drilling deeper, or else the dug wells are abandoned and drilled wells are sunk to furnish better and more permanent domestic water supplies.

Deep wells have been drilled in the city of Meriden by several industrial concerns, in order to obtain supplies for their factories. In general these wells yield moderate amounts of water, but it is only fair for use in boilers, and the softer surface water of the municipal system has been again utilized for making steam. The chemical character of the water from three of the drilled wells is shown by the analyses of water from wells 7, 41, and 52, given on page 52.

The water from well [illegible] is fairly soft and contains only small amounts of mineral matter in addition to the calcium and bicarbonate radicles, which, combined as calcium bicarbonate, form with the silica the principal constituents of the scale that results from the use of this water in boilers. The water from well 52 contains nearly twice as much mineral solids and is noticeably harder. Well 52 was drilled in [illegible] by the Charles Parker Co. to a depth of 1,000 feet in an attempt to obtain a large supply of water suitable for industrial use. A pumping test of about [illegible] gallons a minute is said not to have overtaxed the well, and the water is used for some purposes in the factory. This well water forms a very hard white scale in boilers, however, and the city water is used for making steam. The analysis shows that in addition to the relatively high calcium and bicarbonate the water contains a rather large amount of scale-forming sulphate.

Five wells drilled in the grounds of the Edward Miller Co. (well group [illegible]) in [illegible] are said to be the first deep wells sunk in Meriden. Three of the wells are 300 feet deep, the other two being respectively [illegible] and [illegible] feet in depth. The deepest well was not successful and has been abandoned. The shallowest well is said to have the greatest yield. It and the three 300-foot wells supply the needs of the factory except for making steam, for which purpose the softer municipal water is used. The amount of well water that is pumped varies according to the factory needs, but a supply of 75,000 to 100,000 gallons a day of [illegible] hours is said to have been obtained at times from the four wells.

The factory of the Meriden Curtain Fixture Co. and the factory of Foster, Merriam & Co. each have a well about 300 feet deep. The well of Foster, Merriam & Co. is said to have a capacity of about 170 gallons a minute, but that of the Meriden Curtain Fixture Co. yields only about 25 gallons a minute. Like the other deep wells of the town, these also yield water that is too hard to be satisfactory for boiler use, but they have supplied other needs of the factories.

The records of the drilled wells in Meriden show that in the sandstone, which throughout most of the town is below the "Anterior" or lowest trap sheet, never-failing domestic supplies can be obtained from wells about 100 feet deep. Supplies of less than 10 gallons a minute are usually developed at this depth, however. The 300-foot wells of the Edward Miller Co. do not seem to have obtained appreciably larger supplies than shallower drilled wells in the town. A 562-foot well drilled by the International Silver Co. did not obtain water that was suitable for their factory needs. The deepest well that was reported is that of the Charles Parker Co. (No. 52). By drilling to 1,000 feet a supply of more than 50 gallons a minute was obtained, but it was not learned whether the main water supply was truck near the bottom of the well in a porous sandstone or whether ; was obtained from numerous joints and crevices in the fairly solid andstone. Although this one well, 1,000 feet deep, is capable of ielding fully 50 gallons a minute, other wells, sunk to equal depth n the sandstone, may not be equally successful in tapping a fairly arge supply of water.

Springs.—A number of springs in Meriden have been developed or domestic use, and water from Redrock, Hillside, and Live Oak prings (Nos. 33, 39, and 68) is bottled and sold locally for table ise. The analyses of water from Hillside Spring (No. 39, p. 52) hows that it has a fairly low total solid content. Calcium and bicaronate, two of the substances that render water hard and form scale n boilers, are the principal constituents in this spring water, as in he well waters of the region. Most of the springs issue directly from the sandstone. Spring 4, however, issues at the base of a steep slope in which trap is exposed, and spring 99 seems to derive its supply from the till-covered slopes above it.

RECORDS OF WELLS AND SPRINGS.

The following lists give data concerning certain wells, scattered throughout the town of Meriden, that are indicated on Plate II and are believed to be typical of their respective localities. Data concerning certain springs are also listed. Several of these springs have been developed commercially, and their waters are locally sold for table use.

MIDDLEFIELD.

HISTORICAL SKETCH.

The town of Middlefield, which occupies the south-central part of the area under discussion, was settled about 1700 by three families, who took up their homes respectively in the lowland in the southern portion, in the highland in the north, and near the center of the town.

The principal village is at Rock Fall, which had a population of about [illegible] in 1915. Middlefield Center and Baileyville are communities of about [illegible] people each. The remainder of the population resides mainly near Coe Hill in the northern part of the town, and near Middlefield railroad station in the southern part.

The area of the town is about [illegible] acres, according to planimeter measurement on the Middletown and Guilford topographic maps.[1] About 2,700 acres in the town, or nearly one-third of the total area, is wooded. The woodlands are very largely contained in one body covering uplands in the western part of the town, however, and only four or five areas of more than a few acres each are situated in the eastern two-thirds of the town. A large area of marsh occupies the south-central portion of the town, along the valley of Coginchaug

[1] The area is given as [illegible] acres on p. 432 of the Connecticut State Register and Manual for 1915, which probably is exclusive of the water surface.

River, and together with a smaller area in the northeast makes a total of fully 400 acres of marsh land.

Higby Mountain reservoir of the Middletown city water supply is in the northern part of the town, and Laurel Brook reservoir, of the same system, lies mainly within the eastern border. Black Pond (Pl. V, *B*) on the west border, Beseck Lake in the west-central portion, and a power pond in the east make, together with the two reservoirs, a total water surface nearly equal to that of the marsh land.

POPULATION AND INDUSTRIES.

In 1744, when Middlefield community was organized as a parish, it contained about 50 families, or possibly 350 people. At this time the community was given its present name, signifying that it was a rural portion of Middletown. By 1815 the population had increased only to about 450, but in 1866, when the parish was incorporated as a separate town, its population was more than double this number.

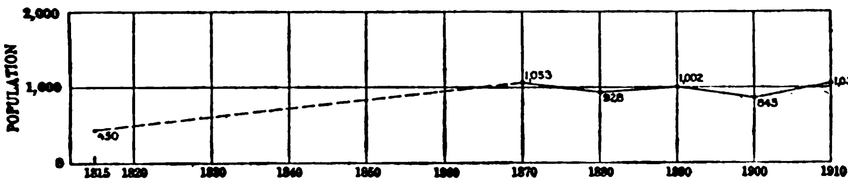

FIGURE 8.—Curve of population of the town of Middlefield, Conn.

Since the incorporation of the town its population has fluctuated somewhat with the activity of factories within its borders, but it has not risen above the figure of the first census after the town was formed. The diagram (fig. 8) shows the fluctuation in population, so far as it is given by the records of the census, taken at 10-year intervals.

The available water power was early utilized by gristmills and other mills, and the manufacture of various small articles was early undertaken. At present factories near Rock Fall and Baileyville produce cording, suspender webbing, and cotton cloth. Other industries in these settlements are the manufacture of gun sights, pistols, and novelties made of ivory and bone.

The greater part of the town is devoted to agriculture. Hay and other field crops are raised on the lower lands, and orchard fruits, especially peaches, are extensively grown in the higher areas. A number of dairy farms have also been established within recent years.

The town is crossed by the Air Line division of the New York, New Haven & Hartford Railroad, which gives direct outlet southward to New Haven and northeastward to Middletown. A trolley line [illegible] to Middlefield Center, and the main [illegible] form a good means of communication with the neighboring settlements.

GEOLOGY.

The town of Middlefield is not traversed by any extensive faults, and the rock structure is therefore simple. The series of Triassic sandstones and [illegible] dips gently eastward, as is shown in the [illegible] of structure section G–H on Plate III [illegible].

In the northwest corner of the town the "Anterior" or lower trap sheet is well exposed [illegible] in the bed of the brook between East Meriden and [illegible] and in a very low ridge at the west side of the road (see Pl. III). This trap sheet is apparently broken and offset by a small fault in the [illegible] corner of the town, for it is there [illegible] by the overlying "Anterior" sandstone, as shown on Plate III. This sandstone forms the uppermost rock along most of the western border of the town, at the base of Higby and Beseck mountains. This northward-trending mountain ridge is formed by the "Main" trap sheet, but this trap dips eastward beneath the "Posterior" sandstone, which forms the uppermost rock through the central part of the town. Eastward this sandstone is succeeded in turn by a band of trap rock of the "Posterior" or upper sheet, which is overlain in the southeastern part of the town by the upper sandstone.

East of the valley of Coginchaug River the upper trap sheet is so far below the surface that it probably would be penetrated only by wells more than 1,000 feet deep. The liability of striking trap rock, which is tough and hard to drill, in wells sunk in the region east of Coginchaug River is therefore remote. The "Posterior" trap sheet, however, immediately underlies portions of Middlefield Center and Rock Fall and the intervening lands, as well as less thickly settled lands to the north and to the south. Wells that are drilled within the area which is shown on Plate III as underlain by the "Posterior" trap will therefore reach the trap immediately beneath the glacial deposits. This trap sheet is 100 to 150 feet thick, but it is probable that by drilling through it into the "Posterior" sandstone, fairly large supplies of water can be developed. The lands underlain by the "Posterior" trap are for the most part lower than the area of "Posterior" sandstone to the west. It seems possible, therefore, that artesian flows can be obtained from this sandstone beneath the confining layer of trap rock at some places in the trap area.

Except along its western border the area of "Posterior" sandstone west of the "Posterior" trap sheet is underlain at depths of

500 to more than 1,000 feet by the "Main" trap sheet. There is therefore little liability that trap will be encountered in wells drilled near Coe Hill and near the outlet of Beseck Lake.

Stratified glacial drift fills the valley of Coginchaug River and the adjacent lower lands, but the greater part of the town is covered by deposits of till. Over the slopes in the southeast the material seems to be fairly thick, and throughout the central portion it forms several drumlin hills. Over Higby and Beseck mountains the till is thin, however, and the trap rock is exposed on their eastern slopes, probably at many points in addition to those indicated on Plate II, as well as in the cliffs that form the western fronts of these ridges.

SURFACE FEATURES.

Middlefield is divided topographically into three fairly distinct belts that trend northward. Along the western side Higby and Beseck mountains constitute a prominent ridge whose crest attains an elevation of about 925 feet on the northwest border of the town. Westward the ridge drops abruptly to rolling land along the edge of the town. Eastward the slope is less abrupt, though steep, to a narrow lowland in part occupied by Beseck Lake and Higby Mountain reservoir. East of this lowland a series of narrow, elongated hills constitutes an area that slopes in the main eastward to the valley of Coginchaug River. The lowest point in the town, where this river crosses the northeastern boundary, lies at an elevation of about 80 feet.

The eastern portion of the town constitutes a gently rolling surface that rises less than 200 feet above the river.

STREAMS.

Coginchaug River drains practically all the town except about 2 square miles in the northwestern part, which is tributary to Higby Mountain reservoir. The Coginchaug has its headwaters in Durham and Guilford towns, several miles south of the Middlefield boundary. For fully half its course through Middlefield it is a sluggish stream, flowing through marsh land half a mile wide. The open valley ends near Middlefield Center, however, and thence eastward the stream has a steeper gradient. The drainage of the west and southwest portions of the town is received by Beseck Lake, which discharges directly eastward to the Coginchaug. In the southeast a portion of the drainage is received by Laurel Brook reservoir. This reservoir overflows northward through Laurel Brook, which joins the Coginchaug half a mile below the Middlefield town line. The drainage basin of Coginchaug River above the northeast border of Middlefield comprises about 33 square miles. The [illegible] that of Quinnipiac River and it has [illegible]. It seems probable, therefore, that the unit runoff from the two basins is approximately the same. On this assumption the discharge of the Coginchaug would appear, by comparison of its drainage area with that of the Quinnipiac and its discharge curve with that of the Quinnipiac (fig. [illegible], p. [illegible]), to be about [illegible] second-feet during the spring high water and [illegible] or 15 second-feet during the summer low-water flow. The daily flow of the Coginchaug and its various tributaries is greatly influenced by mill ponds, however.

A gristmill built near Rock Fall in the eighteenth century, was replaced about [illegible] by a sawmill and below this a fulling mill was constructed shortly afterward. A snuff mill, a powder mill, and other small factories were early established near Rock Fall and near Baileyville. A cotton factory, constructed near the same place in [illegible], was burned in [illegible] and was replaced by a larger structure.

A storage dam was built about [illegible] at the outlet of Beseck Lake by those interested in manufacturing along the lower Coginchaug, and the dam was in later years increased in height. The original pond has thus been greatly increased in size and still furnishes an important supply of water for power development during the lowest stages of Coginchaug River. The drainage area tributary to the lake is about 1,400 acres, of which the lake covers about 35 acres.

GROUND-WATER SUPPLIES.

Water in stratified drift.—So far as was learned by the writer, all the residents in Middlefield obtain their water supplies from individual wells or springs.

In Middlefield only the lowland along the valley of Coginchaug River is covered by stratified drift, and as the larger part of this area is marsh land, few wells have been sunk in it. In the six wells ending in stratified drift that were examined by the writer in May, 1915, the average depth to water was 12 feet, the extreme depths being 7 and 21 feet. (See fig. 3, p. 10). The deepest well is said to fail in summer, but the others yield perennial supplies. An analysis of water from one of the shallowest drift wells (No. 11), given in the table on page 59, shows this water to be comparatively low in total mineral content, calcium and bicarbonate being the chief constituents.

The most promising part of the town for the development of large quantities of ground water is probably in the marshy valley of Coginchaug River, for sandy layers that would yield good supplies to shallow drilled wells, properly screened, probably are present beneath the surficial layers of soil and silt.

Water in till.—The greater part of Middlefield is covered with lacial till, and most of the domestic water supplies are obtained rom wells dug in these unstratified deposits. The average depth water, in May, 1915, in the 27 wells in till that were measured, as 14.3 feet. (See fig. 3, p. 16.) The average depth to water in ells in till on hillsides and in lowlands was only slightly greater han the average depth in the six wells in drift that were observed, ut in several wells in till on the tops of hills and knolls the average epth to water was nearly 21 feet.

The analyses of water from two wells in till (Nos. 6 and 26, p. 59) how larger mineral contents than the water from the well in stratied drift (No. 11), and it is probably true that the waters in the ill as a rule contain more mineral matter than the waters in the tratified drift. This condition is indicated by the average mineral ontents in all the waters of wells in till and drift that were nalyzed. (See table of analyses, p. 59.) The water of well 6 conains rather large amounts of chloride and nitrate, and it is possible hat a portion of these substances is due to contamination by the vastes from the adjacent house. Well 26 is dug beside a house and is situated so that it may receive polluted water both from the kitchen and from the adjacent barnyard. Serious contamination of this sort appears to be shown by the large amounts of chloride and nitrate that were found in the water. This water also is noticeably hard, as it contains relatively large amounts of calcium and bicarbonate.

Water in sandstone and trap.—Five drilled wells were noted in the town in localities where the glacial till is too thin to furnish a reliable water supply. Two of these wells penetrate the "Posterior" trap sheet, their total depths being 60 and 106 feet, and they obtain supplies of soft water sufficient for domestic needs. The other three wells are drilled in sandstone, to total depths of 65, 125, and 150 feet. These wells also yield sufficient water for domestic use, though the capacity of each is probably less than 5 gallons a minute.

Springs.—Three springs (Nos. 4, 15, and 16) were noted in the town. All have slight flow, however, and are little used. Other small springs probably issue on the higher slopes of Beseck and Higby mountains, but no springs were reported to be used for domestic supply.

RECORDS OF WELLS AND SPRINGS.

The following lists contain data concerning certain wells and springs whose locations are indicated on Plate II. They are believed to be representative of the ground-water conditions throughout the town.

MIDDLETOWN.

HISTORICAL SKETCH.

Middletown occupies the central and southeastern portions of the area treated in this report.

The first white settlers established their homes in 1650 in or near the area at present occupied by the city of Middletown, which stands on the site of an Indian village, Mattabesset or Mattabesec, on slopes overlooking Connecticut River. The name Mattabesset is the corruption of a phrase signifying "at the mouth of a large brook." The community was organized in the year following its settlement and was known as Mattabesset until 1653, when the present name was adopted, from the position of the settlement midway between the upper river towns and Saybrook, at the mouth of the Connecticut.

Since the first settlement the population has been concentrated in the city of Middletown, but small communities have also been built up at Westfield, Newfield, and Highland, in the western part of the town, and in the vicinity of Maromas railroad station, in the eastern part.

The town originally included the area that now comprises Chatham and Portland, east of Connecticut River, and also Cromwell, Middlefield and a portion of Berlin. The present area of the town, considering the center of Connecticut River as its eastern boundary, is about [illegible] acres, according to planimeter measurement on the Middletown, Guilford, and Meriden topographic maps.[1] A relatively large part of the town—[illegible] per cent—is wooded, the main wooded area being in the southeast, as shown on Plate IV (in pocket). As in other parts of the State, practically all the trees of the original forest have been cut, and the woods now consist almost entirely of small trees of later growth. About [illegible] acres, or 2 per cent of the area, may be classed as marsh. This area consists largely of land adjacent to Mattabesset River, along the northeast border of the town, but there are also marshy areas of considerable extent near the southern border of the city and in the southern and southeastern portions of the town. The western half of Connecticut River, which is included within the town, constitutes its greatest water body and covers about [illegible] acres. Several ponds and reservoirs cover a total area less than one-third as great, or only about [illegible] acres.

POPULATION AND INDUSTRIES.

In 1673 the entire town of Middletown contained only 52 families, and for the next few decades the growth in population was slow. An actual decrease took place in some years, for the country is rough, markets are distant, and the heavily timbered farm lands offered little inducement to immigration. During the half century preceding the American Revolution, however, the town increased notably in population and in prosperity, owing chiefly to the development of trade with the West Indies, where cotton cloth and other finished products were exchanged for rum, molasses, and tropical goods.

The development of industries and the location of institutions near the original settlement have caused the population of the town to remain concentrated near this place. The city was incorporated in 1784 and, as is shown in figure 9, more than half the total population of the town is within the corporate limits. A considerably greater percentage of the total population than is indicated by the diagrams is located within 2 miles of the city hall, for there are built-up districts to the south and southeast, beyond the city limits.

At the time of the Revolution the city of Middletown had become an important shipbuilding and commercial center, and manufacturing was also becoming important. The first steam-driven factory in the State was built in 1812 by the Middletown Woolen Manufacturing Co.[2] The industrial activity of the city continued to increase

[1] The area is given at 27,287 acres on p. 433 of the Connecticut State Register and Manual for 1915.

[2] Encyclopaedia Britannica, 11th ed., subject Connecticut.

until, in the middle of the nineteenth century, it was one of the principal cities in the State. The development of the rival cities of New Haven, Hartford, and Bridgeport into railroad centers, as well as seaports, gave them a great advantage over Middletown, and beginning about 1850 this city declined in commercial activity for several decades. Within recent years, however, Middletown has shown renewed activity as a manufacturing center. The principal industries at present include the manufacture of pumps and other hydraulic machinery, hardware, automobiles, typewriters, cutlery, and other small articles, and wooden, cotton, rubber, silk, and web goods. Agriculture and dairying are carried on throughout the lower lands of the town. Brickmaking is an extensive industry at Newfield and near Westfield, and feldspar and building stone have been produced in great amounts from pegmatite and granite gneiss in the

The central portion of the town is underlain by the upper sandstone, beneath which the three trap sheets presumably have their usual relative positions. In the vicinity of Staddle Hill the upper surface of the "Posterior" trap sheet is probably about 500 feet below the surface, and at other points nearer the eastern border of the zone of "Posterior" trap, this rock is of course nearer to the surface.

The Triassic rocks dip eastward at an angle that decreases from about 15° to about 10° from the horizontal. This eastward dip probably carries the "Posterior" trap sheet to a depth of 1,500 feet or more below the city of Middletown, provided this upper trap sheet, the thinnest of the three trap sheets, persists as far eastward as the city.

The central area of upper sandstone is bounded on the east by the great fault zone that forms the eastern border of the central lowland of the State. The ancient crystalline rocks east of the fault have been uplifted with respect to the Triassic rocks. No definite contact of rocks of the two classes has been found at any point along the fault zone in Middletown, but the existence of faulting is shown by the presence of crushed, laminated phases of the sandstone in the transition zone from unaltered sandstone to the granite gneiss and pegmatites.

The belt of lowland nearly a mile wide that extends from the city of Middletown nearly to Mattabesset River is covered by stratified drift. Narrower areas of drift also extend up the valleys of Sawmill and West Swamp brooks, and the lowlands along Coginchaug River and along the main branches of Sumner Brook likewise contain deposits of stratified drift. In the lands along the lower portion of Mattabesset River this drift seems, from the records of wells, to be in some places more than 50 feet in thickness. It contains extensive beds of clay that have long been used for brickmaking. Over parts of the lowland the drift is very thin, however, and the underlying bedrock of sandstone or of trap crops out at a number of places, as is indicated on Plate II (in pocket).

The greater part of the town is overlain by deposits of till, though on the higher lands the till is only a few feet thick and the underlying rocks are exposed in many spots. In Lamentation and Higby mountains the lava rock of the main trap sheet that forms these ridges is well exposed in their cliffs. On their eastern slopes the trap is also exposed over considerable areas beneath the very thin covering of till. On these slopes the trap is doubtless exposed in many places a few yards in extent that can not well be shown on a map of the scale of Plate II. Over the highland area in the southeast the till is [illegible] of the granite bedrock and [illegible] of pegmatite are exposed in many places. There are also [illegible] many exposures of the bedrock in [illegible] Plate II.

SURFACE FEATURES.

Middletown has an irregular shape, being bounded on the north and east by streams—the Mattabesset and the Connecticut—and having a large reentrant in the southwest, caused by the incorporation of the former parish of Middlefield as a separate town.

The southeastern portion of the town is occupied by a rugged, hilly area that forms part of the eastern highland of the State. Within the town Bear Hill and Chestnut Mountain are the highest points of this highland, but their respective elevations are only 650 and [illegible] feet. Near its western border the town includes portions of Lamentation and Higby mountains, the highest point in the town being on the crest of Higby Mountain at an elevation of about 925 feet. Between the two hill areas in the east and in the west the surface is rolling or hilly, and the drainage is developed along narrow northward-trending valleys.

There is a wide area of lowland in the northern portion of the town, in the vicinity of Mattabesset River and along its tributary, Sawmill Brook. Near the city of Middletown there are also lowlands to the west along Coginchaug River and to the southeast along the main branches of Sumner Brook. East of the city, along the Connecticut, the slopes come down rather abruptly to the river, but there is a narrow lowland extending westward from Maromas railroad station and a meadow a quarter of a mile wide at the mouth of Hubbard Brook.

STREAMS.

Connecticut River, the master stream of the region, borders the eastern side of Middletown for 9 miles. In this portion of its course the stream has a width of one-eighth to three-eighths of a mile and a depth of channel sufficient for small seagoing vessels. The limit to the draft of ships that traverse the river is chiefly determined by a bar at its mouth, 30 miles below Middletown city. The influence of the tide is felt in the river for a number of miles above Middletown.

The drainage from the different parts of Middletown flows in fairly direct lines to the Connecticut. Mattabesset River, which forms the northern border of the town, receives several northward-flowing brooks that drain the northern and western lands. Sawmill Brook, the principal one, heads near the western boundary of the town. Early in May, 1915, it was carrying nearly 2 second-feet of water in its lower course, but its normal summer flow probably is less than half that amount. A considerable part of its flow also sinks in the lowland near Mattabesset River before uniting with that stream.

The flow of Fall Brook, which joins Sawmill Brook near Westfield, is in large part stored in Higby Mountain reservoir. At the falls of the brook, where it cascades across the main trap sheet near Westfield, it had, in May, 1915, a flow of about 0.5 second-foot, but nearly all this water was absorbed by the gravel of the lowland in the half mile between the falls and Sawmill Brook.

The slopes between Westfield and Newfield are drained by West Swamp Brook, which joins the Mattabesset a mile below Westfield station, and by a brook that enters the main stream one-quarter of a mile above the station. Neither of these streams normally carries more than 0.2 or 0.3 second-foot of water.

Coginchaug River, which flows from the southwest through Middlefield, is ponded both in Middletown and in Middlefield, and its daily flow is greatly affected by the storage or release of water at the mill ponds. On May 5, 1915, the discharge of the Coginchaug 1 mile above its junction with the Mattabesset was 52 second-feet, but its average flow during the six months of low water has been given as about 18 second-feet.[1]

The Coginchaug unites with the Mattabesset in the marsh lands half a mile from Connecticut River. The current of the Mattabesset apparently is so checked by its entrance into the larger, more sluggish stream that it deposits a considerable portion of the sediment carried during freshets. Willow Island seems to have been thus built up in the Connecticut opposite the mouth of the Mattabesset.

Sumner Brook drains the southern portion of Middletown and enters Connecticut River at the eastern border of the city. Its western branch, sometimes called Pameachea Brook, drains only slopes that are within the town, but the eastern branch, early known as Sanseer Brook, rises on the border between Durham and Haddam, 2 miles south of the Middletown boundary. Measurements of the west and east branches short distances above their junction three-quarters of a mile from the Connecticut, on May 5, 1915, showed discharges respectively of 20 and 7 second-feet. Both streams are used for power at storage dams short distances above their junction, and these measurements may represent the approximate amounts of water that are normally used during factory hours. Storage dams at Dooley Pond, on the upper course of the west branch, and at a

[1] Report on the investigation of the pollution of streams, p. 45, Connecticut State Board of Health, Hartford, 1915.

similar reservoirs on the east branch aid in controlling the flow for factory use.

The average low-water flow of Sumner Brook probably is proportional to that of Coginchaug River, which has a total drainage area of about 39.7 square miles and an average summer flow at its mouth of 18 second-feet.[1] The entire drainage area of Sumner Brook is about 12.4 square miles, so its mean summer supply to the storage dams along its branches is presumably 5 or 6 second-feet.

The highland area in the eastern part of the town is drained mainly by brooks that flow eastward to the Connecticut. Hubbard Brook and another stream that crosses the southeast border of the town are the largest of these brooks, but each carried only about three-quarters of a second-foot early in May, 1915.

The northwest portion of the highland is drained by two small brooks, whose headwaters have been dammed to furnish a water supply for the State Hospital at South Farms.

WATER SUPPLIES.

Surface water.—In 1866 the city of Middletown constructed Laurel Brook reservoir for a municipal water supply. This reservoir has a mean depth of 1[illegible] feet and a capacity of 220,000,000 gallons. Its watershed has an area of 1.05 square miles (672 acres). The growth and increased needs of the city rendered the supply from this reservoir inadequate about 1897, and Higby Mountain reservoir was constructed, with a maximum depth of about 27 feet, a capacity of [illegible] gallons, and a drainage area of 2.06 square miles (1,318.4 acres).[1] The total safe daily supply from the two reservoirs, estimated at 2,300,000 gallons, was nearly reached during 1913, it being estimated that in the later part of that year 15,000 people were served, the average daily consumption being 2,000,000 gallons, or 133 gallons per capita. By complete metering of the system and the reduction of all wastes to a minimum, however, it has been estimated that the present supply will suffice for the needs of the moderately growing city for a number of years longer. On the basis of an average daily consumption of 90 gallons per capita and the present rate of growth, the supply has been figured as sufficient until 1940. Beseck Lake is considered by hydraulic engineers to offer an available source when an additional supply is needed.

During the summer months some trouble is experienced from a taste and odor developed by algae in the open reservoirs, but treatment with copper sulphate has very appreciably reduced this un-

[1] Connecticut State Board of Health Rept., p. 45, 1914. See also estimate on p. 37, based on discharge of Quinnipiac River.

avorable condition. The following partial analyses show the eneral quality of water in the two reservoirs. The low figures or dissolved solids and hardness indicate waters suitable for inustrial use and domestic supplies. The water from Laurel Brook eservoir has a higher content of dissolved solids, owing, it is said, o the greater effect of evaporation during this reservoir's longer eriod of use.

[a] From report of a consulting engineer. Name of analyst not given.

In 1880 a 2,500,000-gallon impounding reservoir was constructed on a branch of Pameachea Brook by an earthen dam 300 feet long, as a water supply for the State Industrial Home for Girls. One or more drilled wells on the grounds have within recent years augmented this surface-water supply.

The State Hospital for the Insane, situated at South Farms, is supplied by five storage reservoirs, as shown on Plate IV (in pocket). Three mains, 6, 8, and 16 inches, respectively, in diameter, conduct the water to the grounds. The two reservoirs that are not thus directly connected contain additional storage supplies that can be turned into the adjacent reservoirs.

The only other surface-water supply reported in the town is a system that pumps water from Laurel Brook to a private estate on a knoll one-third of a mile west of Long Hill.

The available records indicate that in 1915 about 15,000 people were supplied from the Middletown municipal water system and about 3,000 from the systems of the Industrial School and the State Hospital.

As is shown in the preceding paragraph, about 18,000 people, or 82 per cent of the entire population of Middletown, are supplied with surface water. The remaining 4,000 people depend on individual wells and springs.

Water in stratified drift.—The areas of stratified drift in the northwestern part of the town are to a large extent underlain by clay, and although supplies of water sufficient for domestic purposes may be obtained, the fine-textured sediments do not readily yield water. Detailed study of the stratified drift as a water bearer was not made, but so far as was observed it seemed that the stratified deposits in the valley of the main branch of Sumner Brook were more sandy than in the areas farther west and north and offered the most favorable conditions for the development of ground water on a large scale for industrial or municipal use.

The average depth to water early in May, 1915, in the 21 dug wells that obtain water from the stratified drift was 13.1 feet (see fig. 3, p. 16), but the water level ranged in individual wells from 3 feet in a hillside well to 26 feet in a well in the lowland.[1] Only one of these wells (No. 20) is said to go dry in summer.

Water in till.—As the greater part of the town is covered by deposits of till, the majority of the domestic wells obtain supplies from this material. There is marked difference in the depth to water in different wells, owing to the diversity in the surface features of the town, which includes crystalline highlands thinly covered with till in the southeast, sandstone hills in the south, and trap ridges in the northwest, as well as rolling lands more deeply covered with till throughout the central portion. The extremes of water level in the 55 wells in till that were measured were 2 and 36 feet, both extremes being in wells on slopes. The average depth to water in the hillside wells in till was 16.1 feet, early in May, 1915, and 10.3 feet and 12.3 feet, respectively, in wells in lowlands and on hilltops. The fact that the shallowest average depth in wells in till was on hilltops may have been because the relatively thin layer of till and consequent shallow depth to bedrock on the higher lands kept the water table nearer the surface than in localities where the till is thick.

Water in bedrock.—Many of the wells in till go dry in summer, and in localities where these glacial deposits are too thin to furnish reliable water supplies, wells drilled into the bedrock have of late years come into favor. The 16 drilled wells that were noted in the town (see p. 71) range from 57 to more than 200 feet in depth, averaging about 113 feet, and the average depth to water in May, 1915, was about 25 feet. One well (No. 102) furnishes water at the rate of about 20 gallons a minute. So far as was learned, the other drilled wells have smaller capacities, though careful pumping tests might show that they are capable of yielding more than the amounts with which their owners credit them. The lower half of one well (No. 24) is drilled in the "Main" trap sheet but furnishes a supply of about 5 gallons a minute from this rock. The trap here is probably fractured and fissured to a greater extent than usual, as the locality is

[1] In the preparation of figure 3 Middletown dug wells Nos. 17, 70, 72, and 84 were omitted, for they obtain water from the sandstone.

close to one of the largest faults or breaks in the rock structure. (See Pl. III, in pocket.)

The quality of water in the drilled wells is indicated by the analyses of water from three of them included in the table on page 72. They are waters of moderate mineral content, in which the principal constituents are the usual calcium and bicarbonate. These constituents are largely responsible for the rather high hardness of the waters. This hardness would be somewhat objectionable in washing, for soap would be wastefully consumed, and in steam-making, for the formation of scale would gradually lower the efficiency of the boilers and eventually necessitate cleaning them.

Springs.—Several springs in Middletown furnish domestic water supplies, and in 1915 water from three of them (Nos. 35, 37, and 87) was sold locally for table use. Two other springs (Nos. 27 and 103) also were formerly developed commercially. Water from a spring near the southwest border of the town has long been piped southward as a supply for the village of Durham, but in 1915 the spring was not accessible to the writer. The analyses of three of the spring waters given on page 72 show that they contain notably less mineral matter in solution than the average well waters, but the principal dissolved substances in the springs also are calcium and bicarbonate.

RECORDS OF WELLS AND SPRINGS.

The following lists of wells and springs through the town are believed to represent typical conditions in their respective vicinities. The locations of the several wells and springs are indicated on Plate II.

ROCKY HILL.

HISTORICAL SKETCH.

The town of Rocky Hill forms the northeast corner of the area discussed in this paper. It embraces the land that lies between Connecticut River on the east and Mattabesset River on the west, and between the towns of Newington and Wethersfield on the north and of Cromwell on the south.

The name Rocky Hill first appears in the records of Wethersfield in 1649, and a grant of land at Rocky Hill was made to Samuel Boardman in the same year. Historical records indicate that a small community existed at Rocky Hill in 1680, the immigrants being the sons of settlers in Wethersfield who started a new community at the convenient landing place 4 miles farther south, on the west bank of the Connecticut, where the river swings over to the base of the rocky hill from which the town is named. It is probable that not more than half a dozen families constituted the first settlement, and it was not until 1720 that it was organized as a parish of the town of Wethersfield. The name "Stepney Parish" was adopted in 1723, but the local name of Rocky Hill clung to the community, and this name was formally adopted in 1826.[1] The present town was incorporated from Wethersfield in 1843. The original settlement has remained the principal village, but the population has also spread along the main highway extending to the north and to

[1] The hill has been locally known as Shipmans Hill, from the tavern of Samuel Shipman, early built at its western base.

the south, and a number of farmhouses also dot the western portion of the town.

The area of the town, taking its eastern boundary as the center of Connecticut River, is about 9,100 acres, according to planimeter measurement on the Middletown topographic map.[1] About 240 acres of this total is covered by the river surface, however. There are only three or four small ponds in the town, and their combined area is only 10 or 15 acres, but four areas of marsh in the northern part, near the headwaters of small brooks, cover a total of about 120 acres. About 23 per cent of the town, or 2,100 acres, is wooded. (See Pl. IV, in pocket.) The woods occupy lands that are chiefly in the southern and eastern portions of the town. These wood lots have been repeatedly cut over, so that very few large trees are left.

POPULATION AND INDUSTRIES.

Shipbuilding and maritime commerce, to which the parish had access through Connecticut River, early became the principal industries. In 1779, during the industrial depression caused by the Revolution, the parish had a population[2] of 881, and during the succeeding 30 or 40 years it developed, chiefly as a shipbuilding center, until it probably had greater industrial importance than it has at present. About 1820 shipbuilding at Rocky Hill began to decline, owing to its more favorable development at other river points, and since that time the population of the town has not changed much. The normal increase due to excess of births over deaths has been about balanced by the excess of those who have moved away over the number of newcomers. The maximum population was reached in 1872–1874, immediately after the construction of the New York, New Haven & Hartford Railroad through the town. This development led to an increase of perhaps 150 in the number of inhabitants, but within a few years this temporary gain was lost. Although the population has remained nearly stationary, its character has changed considerably in the last half century, owing to the emigration of the descendants of the English settlers and the incoming of an increasingly large proportion of Irish. Figure 10 shows the population of the town for the periods for which the figures are available.

Transportation by water on Connecticut River and by rail over the Valley division of the New York, New Haven & Hartford Railroad, which traverses the western border of the river valley, afford easy outlet for produce. A trolley line also gives frequent service between Rocky Hill village and other settlements to the north and to the

[1] The area is given as 9,111 acres on p. 444 of the Connecticut State Register and Manual, 1915.

[2] Stiles, H. R., History of ancient Wethersfield, Conn., p. 952, New York, 1904.

south. The main highway, paralleling the trolley line, is metaled and also affords easy transportation to and from the principally settled portions of the town.

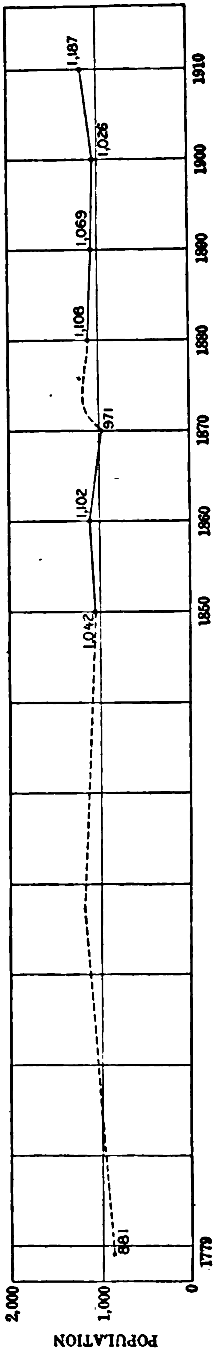

FIGURE 10.—Curve of population of the town of Rocky Hill, Conn.

Since the decline of shipbuilding the chief manufacturing industries in the town have been the making of machinery and of iron castings and forgings. Agriculture and dairying probably are the chief industrial pursuits in the town, however. The northeastern part, between Goff Brook and Connecticut River, is meadow land that is too moist for the successful raising of crops other than the native grasses, but the greater part of the remainder of the town is tilled. Corn and hay are staple crops, though a considerable acreage in the southern portion is devoted to tobacco growing.

GEOLOGY.

Both of the great faults that traverse the region in a southwesterly direction cross the town of Rocky Hill. The eastern fault crosses only the southeast corner of the town, but the western fault extends through its central portion. Several minor faults also displace the rock beds, and the structure within the town is complex. From the northwest portion of the town the successive Triassic rock beds, from the "Main" trap sheet upward to the upper sandstone, inclusive, form the surficial rock eastward through the northern portion of the town. Southeastward, however, the series of beds is traversed before the western of the two major fault zones is reached, and east of this zone the beds above the "Main" trap sheet are repeated. (See Pl. III.)

The most remarkable feature of the bedrock structure is the manner in which the rocks have apparently been rotated by horizontal movement along the major faults, so that in the block between these two great zones of displacement the exposed belts of "Posterior" trap are swung far from the normal north and south trend. The surficial distribution of the several members of the Triassic system that has resulted from the faulting is shown on Plate III (in pocket), and the method by which the faulting has accomplished this distribution is in part indicated by structure section A–B, on the same plate.

The lower lands in the town are covered by stratified glacial drift. Near Mattabesset River, in the southwest corner of the town, and along the branches of Goff Brook, in its northern portion, the stratified deposits are not very prominent, but in the south and southeast they form a sand plain that has an elevation of about 180 feet above sea level. The method of formation of this plain is not clearly understood, but it was probably produced by water from the glacial ice front at a period when the main front of the ice sheet was just north of it and the drainage southward was partly obstructed by glacial débris and remnants of the ice sheet in the lower valley of the Mattabesset and of the Connecticut at Middletown.[1]

The central and western portions of the town are covered by unstratified glacial deposits or till. On the higher hills this material appears to be thick, and some of the hilltops probably are drumlins, but over much of the surface the till is very thin, and the underlying rock is exposed in many road cuts and small cliffs, as is indicated on Plate II.

SURFACE FEATURES.

The most prominent natural feature in the town is the ridge that extends northwestward from the village of Rocky Hill nearly to the town line. It is formed by the "Posterior" or upper trap sheet, which also forms the bedrock immediately below the glacial deposits in other portions of the town. (See Pl. III, in pocket.) Eastward from this rocky ridge a wide, flat meadow only slightly above sea level, extends to Connecticut River. South and west from the ridge the surface is rolling or hilly. In the north-central part of the town the general rolling surface is modified by small marshy areas, and in the south-central portion a sand plain, which continues southward into Cromwell, forms a considerable area of level land.

Although the ridge known as Shipman Hill, near Rocky Hill village, is the most prominent surface feature in the town, it is not the highest, for the slopes on the northwest border reach an elevation of about 310 feet, or fully 100 feet higher than the ridge. Most of the hilltops throughout the rest of the town also attain elevations between 200 and 300 feet. The relief of all these other hills is considerably less, however, as Shipman Hill rises practically from sea level to a height of 200 feet. The lowest portion of the town is of course along Connecticut River, where the influence of the tide is felt.

---

STREAMS.

The western portion of Rocky Hill, comprising about 2,775 acres, or 30.5 per cent of the total area, drains southwestward to Mattabesset River through three or four small brooks that rise in the town. The largest of these brooks has its course entirely within Rocky Hill and joins the Mattabesset three-eighths of a mile above the southwest corner of the town. Its basin has an area of about 1,250 acres and its normal discharge is perhaps half a second-foot. In the last half mile of its course the stream flows through lowlands and in no portion of its course does it offer possibilities of development of power. The greater part of the remainder of the town is drained by several branches of Goff Brook, which first flows northward across the town line and then returns, flowing southeastward along the eastern base of Shipman Hill to the Connecticut. Throughout most of its course it is a sluggish stream, and it is affected by the tide for its last mile or more. The meadow area that forms the northeast part of the town has no well-defined drainage channels other than Goff Brook, and the precipitation on this land finds its way to the Connecticut, either directly or by way of the brook, chiefly through seepage. The southeastern part of the town is drained by two streams. Hog Brook flows northeastward and enters the Connecticut on the southern border of Rocky Hill village. Although this brook usually flows throughout the year, in May, 1915, it was a stream only a foot wide and an inch deep, in its lower course. Dividend Brook drains the area farther south. It rises in the south-central part of the town at the northwest border of the sand plain, and after flowing east for 1¼ miles it turns southward and continues in this direction across the town line before swinging sharply northeast back into Rocky Hill. From the town line it continues northeastward to the lowland along the Connecticut. About three-eighths of a mile above its mouth Dividend Brook falls over a small ledge. A gristmill was built at this site in 1669, and the small available water power has nearly ever since been used by mill or factory.

WATER SUPPLIES.

Water in glacial deposits.—The domestic water supply throughout the town is obtained from individual wells and from a few springs.

Stratified drift covers the extensive meadow in the northeast corner of Rocky Hill, the sand plain in the southern portion, and the lower lands along its eastern, northern, and western borders. The northeastern area is too wet for habitation or cultivation, as water stands nearly at the surface over the greater part of it. This land could be improved by drainage, and it could doubtless furnish large amounts of shallow ground water, but the water from this saturated land may be of unsuitable quality for many purposes. The depths to water in four wells (Nos. 40, 41, 42, and 43) in the sand plain in the southern part of the town indicate that the ground-water level deepens eastward, toward the main channel of Dividend Brook, in the same way that in the southward continuation of the plain in Cromwell the underground drainage is toward the main surface stream. In the other drift-covered portions of Rocky Hill few records of dug wells were obtained, but the shallower water levels seem in general to be found on the lower slopes. The average depth to water in the 10 drift wells measured in May, 1915, was 13 feet (see fig. 3, p. 16), or slightly less than the average depth to water in all drift wells observed in the six towns that were studied.

In the till-covered portions of Rocky Hill the depth to water was measured in 22 dug wells that obtain water from this material. Dug well 28 has been omitted because it probably obtains water from trap rock. The depth in May, 1915, ranged from 7 to 21 feet, both the maximum and minimum depths to water being approximated in individual wells on hilltops, on slopes, and in lowlands. The average depth to water in the 22 wells was 13.7 feet, as compared with 13 feet in the measured wells of the town that end in drift.

Water in sandstone and trap.—Many of the dug wells, especially those sunk in till, go dry in summer. Within recent years, therefore, deeper wells have been put down by drilling machines at a number of places. These drilled wells yield unfailing supplies of water, though the capacity of some of them is very small. Two of the 11 drilled wells that were observed yield small artesian flows. One of these (No. 5) is only 55 feet deep, and only the lower 9 feet is in sandstone, from which rock a flow of half a gallon a minute is obtained. The artesian pressure is very probably due to the chance intersection of a favorable arrangement of fissures in the rock and not to an extensive artesian condition; for in well 4, only 200 or 300 yards to the north, little or no artesian pressure was encountered. Well 23, drilled to a depth of 65 feet in the trap at the southern end of Shipman Hill, has an artesian flow about equal to that of well 5. The artesian pressure in well 23 is apparently furnished by water in fissures in the trap that compose the hill, and the well is doubtless supplied by water that reaches it along the system of fissures and crevices in the trap. The following analysis of water from this well shows that it is noticeably more highly mineralized than the usual shallow-well waters of the region. Calcium, magnesium, and bicarbonate predominate, but the chloride and nitrate constituents are also higher than the average and indicate the possibility of contamination.

Chemical composition and classification of water from drilled well 23 at Rocky Hill.

Chemical character	Ca-CO_3

Another well (No. 12), drilled at the base of Shipman Hill, penetrated the trap sheet and draws part of its water from the underlying sandstone. This well, by means of an electrically operated pump and a small storage tank on the hillside, supplies water to six families near by.

Springs.—Two springs (Nos. 26 and 44) were noticed in Rocky Hill that are used for domestic supply. Each issues near a stream channel from the mantle of stratified drift overlying the sandstone, and though their yields are small they are said to be perennial. No other springs were seen in the town, but similar ones probably issue near the courses of other brooks.

RECORDS OF WELLS AND SPRINGS.

Data concerning a number of wells and springs in the town of Rocky Hill are given in the following table. The locations of these sources of water are indicated on Plate II. The wells listed are believed to be typical of those in the several portions of the town.

GEOLOGY AND WATER RESOURCES OF THE GILA AND SAN CARLOS VALLEYS IN THE SAN CARLOS INDIAN RESERVATION, ARIZONA.

By A. T. SCHWENNESEN.

INTRODUCTION.

In recent years the Indian farmers in the valleys of Gila and San Carlos rivers, in the San Carlos Indian Reservation (Pl. I and fig. 1), have been seriously handicapped by an inadequate supply of water for irrigating their crops. A shortage of water at times when it is most needed has tended to discourage those Indians who are making an earnest effort to farm and has done much toward neutralizing the efforts of the reservation officials to interest others in agriculture. The water shortage has been due to a lack of water in the streams at certain times of the year and to the difficulties of keeping diversion dams and ditches in operation on account of washouts caused by sudden floods in the rivers and by torrents in the tributary arroyos during heavy rains. In the river valleys many tracts of good land now lying idle could be made productive if sufficient water were obtainable. An extension of the present system to include these lands, however, would be likely to fail, from the same causes that contribute to the inadequacy of the present system.

Several officials of the United States Office of Indians Affairs, who are familiar with conditions in the reservation, have suggested the use of ground water for irrigation, and in response to these suggestions the Indian Office requested the United States Geological Survey to make an investigation of the ground-water conditions. The purpose of this investigation, as expressed in the letter of authorization, was "to determine the feasibility of drilling for an irrigation water supply, the examination to be restricted to land not included within the proposed San Carlos reservoir."

The field work covered a period of three months and was completed in December, 1914. Soon after its completion a report was made to the Indian Office containing (1) a brief description of the geologic conditions which influence the occurrence of ground water in this

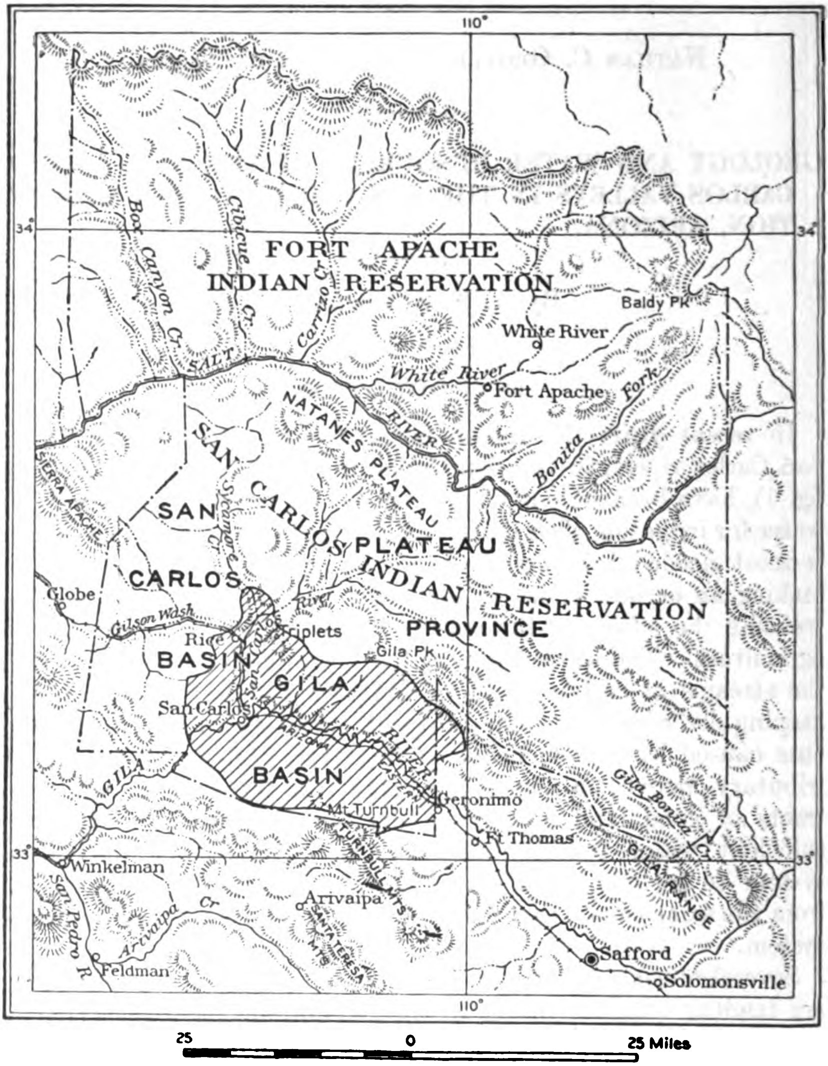

FIGURE 1.—Map of San Carlos Indian Reservation, Ariz., and adjacent regions, showing physiographic provinces.

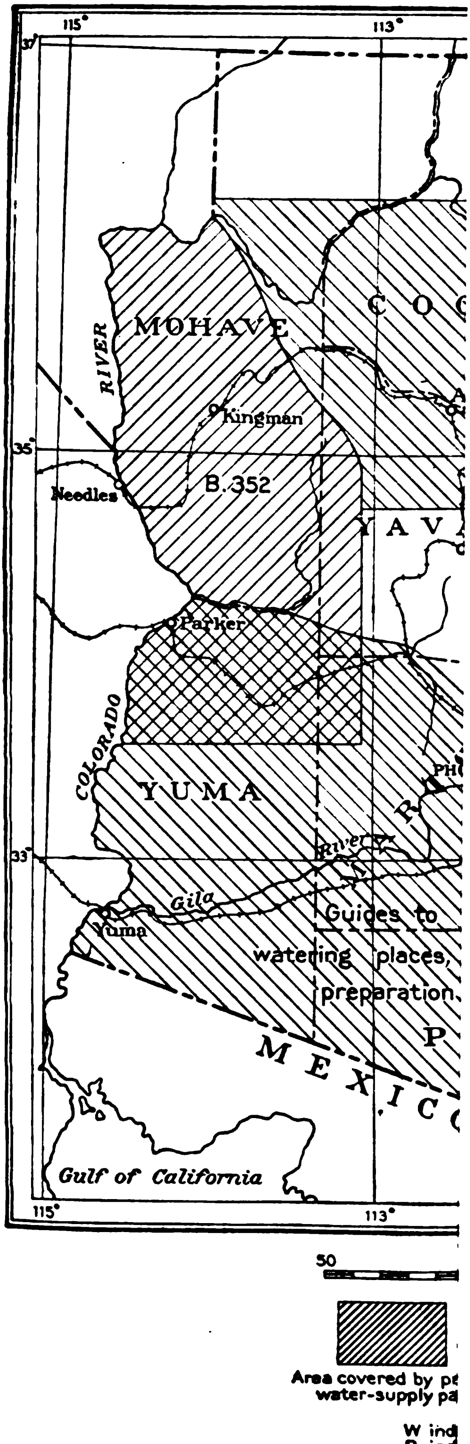
region, (2) a discussion of the available pumping supplies in the Gila and San Carlos valleys, (3) a discussion of the artesian possibilities, and (4) a summary of conclusions, with certain definite recommendations as to the mode of procedure to develop a sufficient



MAP OF ARIZONA SHOWING AREAS COVE
SURVEY REL

ground-water supply and to increase the irrigated acreage in the reservation. The work was done under the direction of O. E. Meinzer, geologist in charge of the Survey's investigations relating to ground water.

To determine the available supplies for pumping from wells in the river valleys a study was made of the valley sediments with reference to their water-bearing capacity. To determine the quality of this supply for irrigation water samples were collected from representative wells and sent to the University of Arizona for analysis.

The artesian problem required the mapping of the geologic formations in the Gila and San Carlos basins and a study of their structure. The results are shown in Plate II and figure 2. Before recommending the development of either a pumped or artesian water supply it was

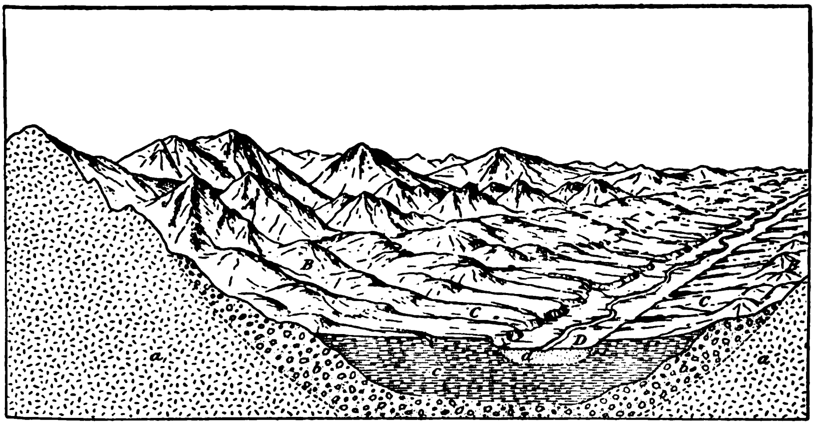


FIGURE 2.—Generalized view and cross section of Gila Basin, San Carlos Indian Reservation, Ariz., showing physiography and geology. *A*, Mountains; *B*, hilly belts, produced by erosion of older alluvial material (*b*); *C*, dissected ancient lake bottom; *D*, valley of Gila River, produced by erosion of lake beds (*c*) and later deposition of alluvium (*d*); *a*, pre-Quaternary igneous and sedimentary rocks; *b*, Gila conglomerate; *c*, lake beds; *d*, Recent alluvium.

important to know whether the amount of arable land in the San Carlos and Gila valleys above the proposed reservoir site was sufficient to warrant the drilling of deep wells or the construction of pumping plants. For this purpose a plane-table map on a scale of 2,000 feet to the inch was made of the portions of the San Carlos and Gila valleys above the proposed site (Pls. III and IV).

It was originally planned to include the results of this investigation in a more comprehensive paper on parts of southeastern Arizona. On account of the writer's resignation from the Geological Survey and the changes produced by the war the publication of such a paper has been indefinitely postponed, and it appears desirable to publish the present brief report, not only to make the local data more accessible but also because of the bearing of these data on the geologic history and ancient lakes or other bodies of standing water that have been observed in the fill of other parts of Gila Valley, in the fill of San Simon and San Pedro valleys, and, with less certainty, in the fill of Sulphur Spring and San Bernardino valleys.[1] These deposits in Gila, San Pedro, and San Simon valleys are no doubt related to one another and have an important bearing on the late geologic history and also on the water supply of the region.

Acknowledgments are due to the superintendent of the reservation, Mr. A. L. Lawshe, and to others for assistance in conducting the field work and for many courtesies; to Mr. C. H. Southworth, engineer of the Indian Office, for furnishing water analyses and for extending the hospitality of his camp; and to the University of Arizona and Mr. A. E. Vinson, of the university staff, who made analyses of the well waters that were collected.

PHYSIOGRAPHY AND DRAINAGE.

GENERAL FEATURES.

The San Carlos Indian Reservation can be divided into two parts—a plateau area, characterized by mountains and lava plateaus, and a basin area, characterized by broad intermontane basins or valleys underlain by river and lake deposits.

The plateau area covers most of the northern and eastern parts of the reservation, including the Ash Flat and Natanes plateaus. Its southern margin is formed by the Gila Range, and its western boundary by a line drawn approximately northward from the Triplets to the Salt River divide. (See fig. 1.)

The basin area includes the Gila Basin, an intermontane trough traversed by Gila River, which flows westward through the southern part of the reservation, and the San Carlos Basin, a similar trough traversed by San Carlos River, which flows southward through the western part of the reservation to San Carlos, where it discharges into the Gila. The basin area is bounded on the south by the Turnbull Range, on the west by the eastern ridges of the Mescal, Pinal, and Apache mountains, and on the north in part by the Gila Range. (See fig. 1.)

With the exception of a narrow strip of country south of Salt River, all of the reservation drains through a gorge which the Gila has cut in the Mescal Range and which is known as the box canyon. The southern part of the reservation, between the Gila and Turnbull ranges, drains directly into Gila River, which crosses the east boundary 2 miles west of Geronimo and flows west-northwestward for 25 miles to its junction with the San Carlos and thence southwestward for 10 miles to the southern boundary of the reservation.

Mex.: U. S. Geol. Survey Water-Supply Paper 425, pp. 1–35, 1917.

A large territory extending from the vicinity of Globe eastward nearly to Gila Bonita Creek and northward as far as the Salt River divide drains into San Carlos River, which at San Carlos enters the Gila from the north.

GILA BASIN.

The surface of the Gila Basin can be divided into sharply contrasting belts that run parallel to its axis. (See fig. 2.)

On the north and south sides of the basin, adjacent to the mountains, are belts of hilly country which stand higher than the middle of the basin and which have evidently been produced by the erosion of what were at one time smooth alluvial slopes extending from the mountains toward the middle of the basin. Inside these hilly belts are belts of lower country which are the remnants of a lake bottom that once extended across the axis of the basin. This lake apparently came into existence after the alluvial slopes had been considerably eroded. As a result of the large amount of sediment deposited in the lake its bottom became smooth and had only gentle slopes toward the middle of the basin. Although this former lake bottom has been eroded since the disappearance of the lake, it still forms a strong contrast to the more anciently dissected marginal belts.

Inside the belts formed by the remnants of the ancient lake bottom is the valley of Gila River, which was cut by the river after the lake disappeared. The parts of the ancient lake bottom adjacent to the river valley have become much dissected, and with reference to the valley they form a rugged upland.

The river valley in its course within the reservation has an average width of 1 to 1½ miles. Farther up the river, between Solomonville and Fort Thomas, the valley is much wider, in some places reaching a width of 4 or 5 miles. The floor of the valley is formed of sediment deposited by the river in the trough channeled out of the lake beds.

The river valley may be divided into river channel, flood plain, and terraces. The valley contains a series of low terraces at successive levels, each bordered by a steep bank. (See section C–C′, Pl. II.) These terraces have been formed by the continued lateral cutting and shifting of the river, together with slight downward cutting. The lowest flats, which are only 2 to 4 feet above the stream channel, are flooded during high stages of the river and therefore may properly be called the flood plain.

SAN CARLOS BASIN.

The San Carlos Basin, though not so well defined as the Gila Basin and of more irregular outline, has the same general types of topography.

The valley of the San Carlos, like that of the Gila, has been channeled out of the older sediments that filled the rock basin and is boredge of the Turnbull Range, and along the east side of the Range. (See Pl. II.) It is carved into a great number of ro ridges that are separated from one another by deep gorges, fo a foothill belt that contrasts sharply with the rugged ranges and also with the intricately dissected but generally even surf the long, sweeping slopes that extend from the lower limit of the hills to the edges of the river valleys.

The conglomerate belt that skirts the Gila Range on the nort of the basin extends across the east boundary of the reserva Within the reservation it has an average width of about 3 mile stretches from the east boundary northward about 15 miles and appears beneath the lava flows centering about the Triplets.

The conglomerate belt adjacent to the Turnbull Range is 2 miles wide and extends westward from a locality 4 miles south of the box canyon to a point south of Bylas. Beyond this po was not traced, but it was seen to narrow considerably and to s southward along the eastern flanks of Mount Turnbull. At the margin it laps up against the range at an average altitude of a 4,200 feet. Its general surface slopes at the rate of about 450 to the mile, and its lower limit corresponds approximately to 3,300-foot contour.

The conglomerate area on the west side of the San Carlos B extends northward from the box canyon along the flanks of eastern ridges of the Pinal Mountains. From the box canyon conglomerate is easily traced northward for 5 miles by its charac istic topography. Farther north the topographic distinction beco less marked, and the contact between the conglomerate and the o lapping sandstone is not easily traced.

As no complete sections were exposed the thickness of the form tion could not be determined, but on the basis of the position a slope of the rock floor as determined in some of the canyons, and the position and slope of the original upper surface of the formati as determined by the ridges of conglomerate, the maximum thickn of the Gila conglomerate in the middle of the Gila Basin is estimat to be not less than 1,000 feet. (See sections, Pl. II.)

LAKE BEDS.

Upon the eroded surface of the Gila conglomerate was deposited series of sandstones, tuffs, limestones, and marly clays which will b referred to collectively as the lake beds, for they were evidentl deposited in a body of standing water. This formation underlie the central and intermediate parts of the Gila and San Carlos basins, where it is at the surface except in the river valleys. (See Pl. II.)

The sandstone member of this formation is a soft, fine-grained, well-stratified buff sandstone, interbedded with thin layers or partings of a hard indurated sandstone of similar composition but usually

ALLUVIUM.

The youngest sedimentary deposit in the area is the allu
the Gila and San Carlos valleys. It consists of sand and gra
down in troughs channeled out of the lake beds. Most of
material has been deposited by the rivers and resembles the
that forms the bottoms of the present channels. The grave
the most part been brought down through the arroyos open
the valleys from the sides.

QUATERNARY HISTORY.

The Quaternary history of the region can be outlined as fol

1. Aggradation in the rock troughs, resulting in the depos about 1,000 feet of gravelly alluvium and the construction o steep alluvial slopes.
2. Erosion of the alluvial slopes.
3. Submergence of the lower parts of the alluvial slopes by Deposition of sand, tuff, and other sediments in the lake to a ma depth of probably 800 feet. Continued erosion of the parts slopes that were not submerged.

Volcanism, resulting in the outpouring of basalt, the deposit tuff, and minor faulting and folding, at least chiefly, in the lat of the period covered by epochs Nos. 1, 2, and 3, but may no been confined to No. 3.

4. Disappearance of the lake. The cause of the formation o lake and that of its disappearance are not known. Excavati the valleys by Gila and San Carlos rivers in the old lake bottom intricate dissection of the lake bottom near the river valleys.
5. Partial refilling of the river valleys through deposition b streams, followed by slight changes in stream grade that result the formation of a series of low terraces. Continued erosion o lake bottom.

Erosion of the older alluvial slopes was practically continuous epoch No. 1; the erosion of the mountain ranges continued thro out the period, and the erosion of the lava beds began immedi after their extrusion and continued without interruption.

CLASSIFICATION OF LANDS.

The lands of the Gila and San Carlos valleys may be classe arable or nonarable on the basis of their suitability for farming irrigation if a water supply is provided. Their suitability for purpose depends in part on their topography and the quality of t soil.

SERVOIR SITE
ion

San Carlos River is ordinarily dry for a considerable part of each year, but if the total run-off during normal years could be economically stored it would probably be sufficient to irrigate several thousand acres of land. It is doubtful, however, if feasible storage sites exist on this stream.

The following tables give the essential results of measurements of stream flow on Gila River in the vicinity of San Carlos and on San Carlos River that have been made by the United States Geological Survey. The records of flow on Gila River at San Carlos from 1899 to 1905 are of exceptional value and interest, in that they cover a period of the most severe drought that has been experienced in the history of modern agricultural development in Arizona.

GILA RIVER AT SAN CARLOS, ARIZ.

LOCATION.—Half a mile south of San Carlos Indian Agency at San Carlos, Gila County, half a mile below San Carlos River, and about 7 miles above dam site in box canyon.

RECORDS AVAILABLE.—July 11, 1899, to November 27, 1905 (incomplete). From August 17, 1910, to February 5, 1911, a station was maintained just below the Arizona Eastern Railroad bridge and half a mile above San Carlos River. Because of insufficient data discharges have not been computed for this station. For discharge measurements and gage heights see Water-Supply Papers 289 and 309.

GAGE.—Inclined staff on right bank.

DISCHARGE MEASUREMENTS.—Made from cable a short distance above gage.

CHANNEL AND CONTROL.—Sandy and badly shifting.

EXTREMES OF DISCHARGE.—Discharge varies from zero flow to enormous floods, probably exceeding 100,000 second-feet. No accurate measurements of extreme floods have been made.

DIVERSIONS.—Water for irrigating several thousand acres was diverted above the station for use in the Solomonville and Duncan valleys. A small amount of water (probably not exceeding 5 second-feet at any time) was also diverted just above the gage for irrigating lands within the reservation.

ACCURACY.—Results liable to considerable error, particularly during low stages, on account of shifting channel and control.

NOTE.—No record for the periods Oct. 19, 1899, to Apr. 3, 1900, and Jan. 12 to May 13, 1905.

GILA RIVER NEAR SAN CARLOS, ARIZ.

LOCATION.—One mile above dam site in box canyon, in San Carlos Indian Reservation, about 6 miles below San Carlos Indian Agency, Gila County.

RECORDS AVAILABLE.—April 29, 1914, to September 30, 1917.

GAGE.—Stevens water-stage recorder on left bank about 1 mile above dam site.

DISCHARGE MEASUREMENTS.—Made by wading near gage or from cable about 1 mile above gage.

CHANNEL AND CONTROL.—Channel composed of sand, gravel, and boulders. A semi-permanent control is formed by rapids over heavy boulders just below gage. Control shifts somewhat because of sand filling in and washing out from crevices between the boulders.

EXTREMES OF DISCHARGE.—1914–1917: Maximum stage 25.5 feet January 20, 1916 (approximate discharge, determined from extension of rating curve, 92,000 second-feet); minimum stage 0.15 foot, July 1, 1914 (discharge, 1 second-foot).

DIVERSIONS.—Water for irrigating about 30,000 acres is diverted from river in valley just above station. At times this diversion reduces the low flow practically to zero at the station. About 7,000 acres is irrigated from this stream above the station at Guthrie.

ACCURACY.—Results fair except for extremely high or low stages or for estimated periods. (See footnote to monthly discharge table.)

NOTE.—Mean discharge for May and December, 1914; January to September, and December, 1915; January to March, and December, 1916; and May and September, 1917 estimated or partly estimated by comparison with records at other stations on this stream.

SAN CARLOS RIVER AT SAN CARLOS, ARIZ.

LOCATION.—Opposite railroad station at San Carlos, Graham County, in San Carlos Indian Reservation, about half a mile above junction with Gila River.

DRAINAGE AREA.—Not measured.

RECORDS AVAILABLE.—August 17, 1910, to January 12, 1911,[1] and April 1, 1914, to September 30, 1915, when station was discontinued.

[1] Discharge not computed from Aug. 17, 1910, to Jan. 12, 1911. For discharge measurements and gage heights see Water-Supply Papers 289 and 309.

Gage.—Stevens water-stage recorder on left bank. The original gage, which was used from August 17, 1910, to January 12, 1911, was a vertical staff fastened to right pier of railroad bridge, downstream end.

Discharge measurements.—Made by wading or from cable at gage.

Channel and control.—Sand, badly shifting at all stages. Section flat and nonsensitive.

Extremes of discharge.—Stream dry a part of each year. July 26, 1915, a heavy flood occurred, covering the surrounding lowlands. Discharge not determined.

Diversions.—No record of any diversions, although a small amount was probably diverted above the gage for irrigation.

Accuracy.—Results poor because of shifting control and insufficient discharge measurements.

Monthly discharge of San Carlos River at San Carlos, Ariz., from Apr. 1, 1914, to Sept. 30, 1915.

[a] Estimated.

Note.—Floods above the limit covered by the rating curve occurred during the period Dec. 19-30, 1914, Jan. 29-31, Feb. 20-22, and July 26-31, 1915. Discharge Dec. 31, 1914, 150 second-feet. Mean discharge Feb. 23-28, 1915, 15.7 second-feet.

PRESENT IRRIGATION.

All irrigation on the reservation in 1914 was done with water from the Gila and San Carlos rivers, diverted into the main canals by brush and earth dams thrown across the channels. These dams are temporary affairs that wash out at each flood and must be rebuilt at the beginning of each irrigating season and perhaps several times during the season. They are necessarily low and are too frail to impound the water and raise it much above its natural level, so that the intake of the ditch can be little higher than the bottom of the channel. This condition allows little opportunity for the silt to settle before the water is taken into the canals. Consequently the canals, especially those on the Gila, become choked with silt and must frequently be dug out. Flood waters discharging into the canals through gullies from the sides of the valley also deposit much silt and often destroy sections of the canals by cutting across them.

Permanent dams that could withstand the floods would save much expense and also relieve the present water shortage to some extent, for much water is now lost by seepage through the temporary dams, even when the rivers are low. On account of the unstable character of the bottom and sides of the channels, however, permanent dams may not be practicable on Gila River. On the upper San Carlos a suitable site for a permanent dam could probably be found, but whether the additional land that could be irrigated with the water saved by a permanent dam would warrant its construction is not certain.

The enlargement of the present irrigation system on Gila River to include more of the arable lands in the valley would require the construction of canals at higher levels than those now in use. If permanent dams are not practicable the construction of high-level canals would necessitate either carrying the ditch head much farther up the river and outside of the reservation, or else pumping from the river into the high-level canals.

The most serious drawback to the present irrigation system is the inadequacy of the water supply during certain months of the year. Gila and San Carlos rivers are usually lowest in May, June, and July, the months during which water is most needed. It is not unusual for these streams to dry up entirely at times during these months, so that it becomes necessary to scrape out holes in the sand and gravel of the channels to provide water for stock. According to the stream-gaging records of the United States Geological Survey for 1914 no water passed the gaging station on San Carlos River at San Carlos during April and May, but in June 125 acre-feet and in July 762 acre-feet passed the station. At the gaging station above the box canyon on the Gila the average flow for the first 22 days after the automatic gage was in operation, from May 27 to June 17, was 18 acre-feet per day. As these records were obtained below the irrigated districts of the reservation they do not show the amount of water taken out by ditches.

The yearly cost of keeping up the ditches and diversion dams on the reservation is from $1,800 to $2,000. In 1913 the expenditure in preparation for the season's irrigation was $1,908, according to the statement of the superintendent, A. L. Lawshe. The total area irrigated, according to Mr. Lawshe, was 1,428 acres, of which 421 acres was in the Bylas district, 469 acres in the San Carlos district, and 538 acres in the Peridot district. The cost per acre was therefore $1.34.

SHALLOW GROUND WATER.

OCCURRENCE AND QUANTITY.

Water is found at shallow depths in the Recent alluvial fill of the Gila and San Carlos valleys. Most of the wells are on the low terraces above the stream channels. Most wells dug by the Indians for domestic water supplies are not more than 15 or 20 feet deep, but several constructed by white settlers on higher ground are deeper. The Rice school well, at the base of the bluffs on the north side of San Carlos Valley (No. 3, Pl. IV), is 36 feet deep and has a depth to water of 32 feet. Two large dug wells at the flour mill at San Carlos are 30 and 32 feet deep. The well at the railroad station at Calva, near the foot of the bluffs on the south side of Gila Valley (No. 13, Pl. III), is 75 feet deep, and the water table here is 45 feet below the surface.

The shallow wells on the level arable terraces end in sand and fine gravel similar to the material in the present stream channels. The general correspondence of the water level in the wells with the level of the water in the streams indicates that the alluvium is saturated about to the stream level.

The water is supplied by percolation from the rivers, by water discharged into the valleys through tributary arroyos, and by direct rainfall on the valleys. The principal contributions are probably made by percolation of stream water into the bottoms and sides of the river channels. Second in importance are contributions made by tributary arroyos, a part of whose water sinks into the gravel near the edges of the valleys. The amount of water contributed by direct rainfall is relatively small. The rapidity with which water withdrawn from wells is replenished depends on the porosity and continuity of the water-bearing beds and the location of the wells with respect to the streams. Wells close to the stream channels will probably yield more freely than wells farther back, at a greater distance from the principal source of supply. Where large quantities of water are required it is therefore generally not advisable to sink wells at very great distances from the streams.

The lake beds, which underlie the Recent alluvium, yield some water but do not constitute good water-bearing material. The large dug wells at the San Carlos flour mill, on the gently sloping ground above the San Carlos bottoms, penetrate about 15 feet of coarse sand and gravel and then pass into the lake beds. The upper sands and gravels are above the water level and are therefore dry, and the water is said to come out of thin "clay" seams in soft fine-grained sandstone. The wells are about 30 feet deep and have an aggregate cross-sectional area of about 1,400 square feet. In summer about 50,000 gallons of water is pumped from them during a 10-hour day.

At this rate these large wells are soon pumped down, and in order to continue pumping it is necessary to put into operation a syphon connecting the large wells with a well on the terrace of San Carlos River. When pumping is continuous this well, which is only 10 feet deep and 8 by 8 feet in cross section and which ends in Recent alluvium, furnishes most of the water.

A number of years ago two wells were drilled from the bottom of the larger of the two wells at the flour mill in the hope of getting an increased supply from a deeper stratum. One of these wells reached a depth of about 115 feet, and the other was sunk to a depth of 385 feet below the surface. Both wells were failures, although in the 385-foot well a small supply of water was obtained at 85 feet. All the way down these wells were in the same fine-grained sandstone—probably belonging to the lake beds—found in the lower parts of the dug wells.

QUALITY.

The mineral character of waters from wells and from Gila River is shown in Tables 1 and 2. The samples whose analyses are given in Table 1 were collected by the writer in the course of the field investigation. Table 2 gives the results of analyses of waters from a number of shallow test wells put down in the Gila Valley several years ago under the direction of James W. Martin, superintendent of irrigation for the Indian Office.

In samples 1, 9, 12, 13, and 14 (Table 1), which represent waters from shallow wells in the Gila Valley above the proposed San Carlos reservoir site, the amount of total solids ranges from 1,330 to 2,412 parts per million. Samples 9, 12, 13, and 14 are very high in their content of chlorine, one of the constituents of sodium chloride or common salt, ordinarily referred to as one of the "white alkalies." These waters are practically worthless for irrigation under ordinary conditions. Sample 1 contains less sodium chloride but contains a prohibitive amount of sodium carbonate or "black alkali," which is even more harmful than white alkali. The sample of water from Gila River at the canal intake is representative of the water now used for irrigation on the reservation. Comparison with the well waters shows that it contains less than half as much white alkali. The fact that it has been used successfully for many years for the irrigation of crops in the Gila Valley is sufficient proof of its value as an irrigating water. The effects of its continued use, however, are shown by the alkali spots that appear in the alfalfa fields, and it is questionable whether the crops could endure a much greater amount of these salts. A doubling of the amount of alkali, which would result from the use of well waters such as the analyses represent, would probably prove fatal to most crops, even under the most favorable conditions of soil and drainage.

The sample from the pumping plant at San Carlos (Table 1) is a mixed water from wells at the flour mill and a well about 500 feet northeast of the flour mill, on the San Carlos River bottoms. This water contains less soluble salts than any of the other well waters that were analyzed. It contains a moderate amount of white alkali and a small amount of the more injurious black alkali. As an irrigating water it may be classed as fair, and in its probable effects on crops it is comparable to the water from Gila River.

Unfortunately no analyses of well waters from the San Carlos Valley are available. A sample thought to be fairly representative of well waters in the San Carlos Valley was obtained from a driven well near the river at the new steel bridge across the San Carlos. The sample was too small for a complete analysis, however, and therefore no report on this water was obtained.

TABLE 1.—*Chemical composition of water from wells and from Gila River in San Carlos Indian Reservation, Ariz.*

[Samples collected by A. T. Schwennesen; analyzed by A. E. Vinson at the laboratories of the Arizona Agricultural Experiment Station.]

TABLE 2.—*Chemical composition of water from test wells in Gila Valley in the San Carlos Indian Reservation.*

[Analyses made at laboratories of Arizona Agricultural Experiment Station under direction of R. H. Forbes. Results of analyses taken from report of J. W. Martin, superintendent of irrigation, United States Indian Office, furnished by C. H. Southworth, engineer, United States Indian Office.]

Designation.[a]	Source.	Quantitative analysis (parts per million).			Qualitative analysis.				Classification for irrigation.[b]
		Total solids at 110° C.	Chlorides in terms of NaCl.	Alkalinity in terms of Na_2CO_3.	Sulphate.	Magnesia.	Lime.	Bicarbonates.	
A	Dug test well southeast of Black Point.	884	343	97	Moderate	Very slight	Moderate	Moderate	Objectionable on account of black alkali.
B	Dug test well on north side of river opposite Navajo Bill Point.	11,774	10,180	762	Very strong	Strong	Very strong	Very strong	Objectionable on account of extreme amounts of total soluble solids.
C	Dug test well 1,500 feet south of river bank, 1½ miles east of Dewey Flat.	1,584	970	359	Moderate	Moderate	Strong	Strong	Not desirable on account of large amount of total soluble solids.
D	Dug test well on north side of Gila River 1¼ miles northwest of Cowboy Camp.	2,380	1,590	212	Strong	do	do	do	Not desirable on account of high sodium chloride content.

[a] Approximate location shown on map (Pl. III).

[b] Comments by R. H. Forbes in report to J. W. Martin.

USE FOR IRRIGATION.

Although no definite tests have been made there is reason to believe that the recent alluvium would yield enough water, if pumped from shallow wells, to irrigate all the arable lands. As the principal contributions to the ground-water supply are received from seepage of the streams into the bottoms and sides of the stream channels, wells should be located as near the channels as possible if large yields are desired. Wells and pumping plants should, however, be placed where there is no danger that they will be washed out, for the streams are continually changing their courses and wearing away the lands adjacent to their channels.

Irrigation with water pumped from wells would have an important advantage over irrigation with surface water in that the supply would be nearly uniform throughout the year, whereas surface supplies are most abundant when irrigation is not needed and least abundant in the dry season. Its cost would be considerably higher than the present cost of irrigating with surface water, but this higher cost would be compensated to a large extent by an increased crop yield made possible by an assured water supply in the dry season, during which the crops often suffer.

The principal objection to the use of water from wells is the poor quality of the water. The waters of the Gila Valley are so heavily impregnated with mineral matter as to require extraordinary precautions to prevent the accumulation of an injurious amount of alkali in the soil, and it is doubtful whether they could be successfully used for any length of time even under the most favorable conditions of soil and drainage. The data as to the quality of the ground waters of the San Carlos Valley are meager, but there is reason to believe that these waters are better than those of the Gila Valley.

Final judgment as to the availability of the shallow ground waters may well be deferred until practical tests have been made and their effects on crops noted under actual working conditions. Experiments of this kind should be carried on at the Bylas farm, in the Gila Valley, where a small pumping plant has lately been installed, and similar experiments should be made in the San Carlos Valley.

To the extent that the shallow ground water is found to be good enough for irrigation, it can be used advantageously on the tracts now under cultivation to supplement the inadequate surface water supply, and also on the arable tracts that lie above the present ditch system.

ARTESIAN WATER.

The principles upon which artesian flows from sedimentary rocks depend are explained in textbooks on geology and in many of the publications of the United States Geological Survey. The necessary conditions are concisely stated by T. C. Chamberlin[1] as follows: (1) A pervious stratum to permit the entrance and the passage of the water; (2) a water-tight bed below to prevent the downward escape of the water; (3) a like impervious bed above to prevent escape upward, for the water, being under pressure from the fountain head, would otherwise find relief in that direction; (4) an inclination of these beds so that the edge at which the waters enter will be higher than the surface at the well; (5) a suitable exposure of the edge of the pervious stratum, so that it may take in a sufficient supply of water; (6) rainfall adequate to furnish this supply; (7) absence of any means of escape for the water at a lower level than the surface at the well.

In the Gila Basin and in the lower part of the San Carlos Basin the essential conditions for an artesian flow as stated above are believed to be fulfilled, the Gila conglomerate serving as the pervious stratum for the entrance and passage of the water, the rock floor upon which it rests serving as the lower impervious stratum, and the lake beds serving as the upper impervious stratum. (See section D-D', Pl. II.)

Wherever the Gila conglomerate is exposed it has the appearance of a good water-bearing material. Its outcrops along the flanks of the ranges, several hundred feet above the river valleys, provide a large intake area for the absorption of direct rainfall and run-off from the mountains above. If the conglomerate extends to the axes of the basins and is of the same character as at the outcrops, it fulfills the first requisite given above. Its character near the axes of the basins, where it is hidden beneath the overlying formations, can only be conjectured. It probably contains less coarse material there than where it crops out, but there is no reason to believe that it is entirely devoid of water-bearing gravels.

The rock basins in which the Gila conglomerate lies appear to be sufficiently tight to prevent the escape of ground water. At their lower ends the Gila and San Carlos basins are closed by mountains that allow the escape of surface water through a narrow gorge (the box canyon), but are believed to hold back effectively the deep ground waters. The rock floor of the basins is likewise believed to be sufficiently impervious to prevent the escape of ground water downward and out of the basins.

The lake beds occupy the middle parts of the basins and extend far up on the sides, blanketing the Gila conglomerate to elevations several hundred feet above the river valleys. On the whole they seem to be an effective artesian cover, comparatively free from fractures and sufficiently impervious in themselves to prevent, at

[1] U. S. Geol. Survey Fifth Ann. Rept., pp. 134-135, 1885.

least in part, the upward escape of water imprisoned beneath them. Along the north side of the Gila Valley, opposite Navajo Bill Point and at several other places farther east, small springs issue near the base of the bluffs. A group of springs occurs in the large arroyo which enters the Gila from the north opposite Bylas siding. There is another spring in Kelly Wash, on the south side of the basin, 2 miles southeast of San Carlos. (See Pl. II.) If these springs represent leakage from the artesian reservoir, as seems probable, the lake beds are not perfectly water-tight, but apparently the amount of water lost in this way is not great. At a number of places there are also evidences of a possible disturbance of the artesian cover, as indicated by lava intrusions and slight folding and faulting.

In the Gila Basin favorable artesian conditions exist along the north side of the basin for 15 miles from the east boundary of the reservation to a point 8 miles east of the Triplets. Farther west the Gila conglomerate is not exposed and consequently the artesian prospects are not so good. On the south side of the Gila Basin favorable artesian conditions are found for a distance of 20 miles below Bylas and a point 4 miles east of the box canyon.

In the San Carlos Basin artesian structure exists along the west side for 5 miles northward from the box canyon. Beyond that point the structure may be less favorable on account of possible serious disarrangements of the strata as a result of volcanic disturbances, which are indicated by numerous lava flows. On the east side the absence of outcrops of the Gila conglomerate makes conditions unfavorable.

As the structure is favorable to artesian conditions on one or both sides of the Gila Basin between the east boundary of the reservation and San Carlos, there are prospects that artesian water can be obtained in the river valley between these points by drilling through the recent alluvium and lake beds into the Gila conglomerate.

As the structure is favorable to artesian conditions on the west side of the San Carlos Basin for 5 miles north from the box canyon, there are also prospects that artesian water can be obtained in the river valley from San Carlos north to the new San Carlos steel bridge. All this part of the valley, however, is inside the proposed reservoir site. In the part of the San Carlos Valley above the steel bridge conditions do not appear to be favorable for obtaining an artesian supply.

According to the writer's estimates, based entirely on the probable relative positions of the formations as represented graphically in the cross sections in Plate II, the average thickness of the lake beds near the middle parts of the basins does not exceed 700 feet. However, as no complete sections are exposed, this estimate may be much too low. As the lake beds were laid down on an eroded and somewhat hilly surface, their thickness probably varies from place to place. In some places it may be necessary to drill 1,000 or even 1,500 feet to reach the Gila conglomerate, and as much as 2,000 feet to penetrate the conglomerate deep enough to make a conclusive test.

It is impossible from data obtained in a geologic investigation to predict definitely the presence or absence of artesian water, for the reason that unfavorable conditions may exist underground which do not appear at the surface. However, the investigation that has been made shows that the conditions, in so far as they can be observed, are sufficiently favorable to warrant the drilling of a test well.

As no wells have been drilled into the Gila conglomerate, the quality of the water which it contains is not known. The source of the water is the rain on the outcrop and the run-off from the hard igneous and sedimentary rocks of the mountains above. The water as it enters the Gila conglomerate is therefore probably only moderately mineralized. In passing downward to lower levels through the conglomerate it dissolves more or less mineral matter, but, to judge from the character of the materials in this formation as revealed in its outcrops, the amount of soluble matter is not large. There may, however, be buried saline beds along the axes of the valleys. In view of the source of the water contained in the Gila conglomerate and the character of the formation, there is reason to believe that the water is good enough for use.

SUMMARY AND CONCLUSIONS.

1. The part of the Gila Valley within the reservation and outside of the proposed reservoir site contains about 4,595 acres of arable land. In 1913 only 421 acres, or less than 10 per cent of this arable land, was irrigated and farmed.

2. The San Carlos Valley, all of which lies within the reservation, contains 1,840 acres of arable land above the proposed reservoir site. In 1913, 538 acres, or a little more than 30 per cent, of this arable land was irrigated and farmed.

3. On account of the lack of sufficient water in Gila and San Carlos rivers during a certain period in summer when irrigation is most needed and on account of the difficulty of maintaining diversion dams and canals, the system of irrigation in 1914 was inadequate.

4. In the river valleys water in sufficient quantities for irrigation can probably be obtained by pumping from shallow wells in the alluvium.

5. The principal source of the water in the valley alluvium is believed to be seepage from the rivers. Consequently the largest yields may be expected from wells near the river channels.

6. In 1913 the cost of irrigating under the present system was $1.34 an acre. The cost of pumped well water would probably be higher.

7. The waters from shallow wells in the Gila Valley are heavily mineralized. They are so high in chlorine, which is one of the constituents of common salt, that they are of doubtful value for irrigation, and if used continuously they would require extraordinary precautions to prevent an excessive accumulation of alkali in the soil.

8. The shallow ground waters in the San Carlos Valley are believed to be better than those of the Gila Valley and comparable to the water from Gila River, which is now successfully used for irrigation.

9. Final judgment on the suitability of the shallow ground waters for irrigation should be deferred until their effect on crops has been determined by actual experiment.

10. To the extent that the shallow ground waters are found to be good enough for irrigation they can be advantageously used on the tracts already under cultivation to supplement the surface-water supply and on arable tracts that lie above the ditches.

11. In the Gila Basin structure favorable to artesian conditions exists on one or both sides of the valley between the east boundary of the reservation and San Carlos, and it is believed that artesian water can be obtained in the river valley between these points.

12. In the San Carlos Basin structure favorable to artesian conditions exists only on the west side adjacent to that part of the valley included within the proposed reservoir.

13. To test the water-bearing possibilities of the Gila conglomerate it will be necessary to drill through the Recent alluvium and the lake beds, which, according to the writer's estimates, have an average thickness below the river valleys of not more than 700 feet. In some places it may be necessary to drill 1,000 to 2,000 feet to test the existence of water-bearing beds.

14. The structure appears most favorable on the south side of the Gila Basin, west of Bylas. A good location for a test well would be on Dewey Flat or on the 180-acre tract of arable land 1 mile east of Dewey Flat.

15. There is no direct information as to the quality of the water in the Gila conglomerate, but it is probably good enough to be used for irrigation.

16. Unfavorable conditions may exist underground that will make it impossible to obtain artesian wells, but the conditions as observed at the surface are sufficiently favorable to warrant the drilling of a test well.

GROUND WATER IN LANFAIR VALLEY, CALIFORNIA.

By David G. Thompson.

LOCATION AND GENERAL FEATURES OF THE VALLEY.

The area described in this paper lies in the east-central part of San Bernardino County, Calif. (See Pl. V.) It is mostly a large alluvial plain, which slopes southeastward with a nearly uniform grade of about 100 feet to the mile, though its continuity is at several places broken by small buttes of lava or by granite knobs. This plain is bordered on the west and north by the Mid Hills and the New York Mountains, and on the south and east by several more or less detached mountain masses, composed principally of volcanic rocks. The largest of these detached mountains are the Piute Range, on the east, and Hackberry Mountain, on the south. The plain and the adjacent mountain slopes form a nearly inclosed drainage basin, which is outlined on Plate VI. This drainage basin includes about 325 square miles. The alluvial slopes cover about 260 square miles, or 80 per cent of the basin; the mountains cover about 65 square miles. The grade of the alluvial slopes is generally so slight as not to interfere with agriculture. The basin includes no lowland tract of nearly flat land, such as is found in the Ivanpah, Mesquite, and Pahrump valleys, to the north.

This drainage basin has been called the Barnwell Sink,[1] but this name is not appropriate, because Barnwell lies on its extreme outer edge, and it is not a "sink," for that term is commonly used in the desert region of California to designate the bottom of a closed basin in which a stream disappears either because its water is evaporated or because it sinks into the ground. It is suggested that this area be called Lanfair Valley, as most of the settlements in it are near Lanfair and as that town is not far from its center.

During the last two or three years many settlers have taken up homesteads in this valley, most of them near Lanfair, and have been

[1] Tait, C. E., Irrigation resources of southern California: Conservation Comm. California Rept., p. 824, 1912.

attempting to raise crops by dry farming. In the fall of 1 than 130 registered voters were living here. The writer vi valley in November, 1917, while he was gathering data for a desert watering places,[1] and obtained information about t supply. Although very few wells have been drilled in the va very little data were available concerning the water suppl been decided to publish this brief report because a large nu settlers have already taken up land in the valley or are pla settle there.

ROADS AND SETTLEMENTS.

Lanfair Valley is traversed from north to south by the well and Searchlight branch of the Atchison, Topeka & Sa Railway, which connects with the main transcontinental Goffs, 9 miles southeast of Vontrigger. In 1917 there was service from Goffs to Searchlight six days a week, and on S a train ran from Goffs to Ivanpah. There were small settle at Lanfair, Ledge (Maruba post office), and Barnwell, and offices at the first two places. There was a small store at La at which groceries, gasoline, and oil could be obtained. P Blackburn, and Vontrigger are merely railroad sidings, not se ments. Fair automobile roads connect the valley with the rounding country. The Ivanpah and adjoining valleys ma reached by way of Barnwell. From Lanfair a road leads to C and the Valley Wells mining region, by way of Rock Springs, G ernment Holes, and Cedar Canyon. A road leads southward, pa lel to the railroad for part of the distance, to the much-trave National Old Trails Road at Goffs. Another road leads southw ward and then southward from Government Holes to the Sa Fe Railway and the National Old Trails Road at Fenner.

ELEVATION AND DRAINAGE.

Lanfair Valley stands at a high altitude, most of it 3,500 to 5,0 feet above sea level, and two extensions of the valley west and nort west of Rock Springs rise nearly 5,500 feet above sea level. The two branch valleys reach almost to the summit of the Mid Hill which form a small range in the rim between the Providence Moun tains and the New York Mountains. At one place the almost fla surface of the southern branch valley has been slightly dissected by drainage lines that lead to Cedar Canyon. This canyon, which drains westward, has cut entirely through the former divide of the Mid Hills and is tapping the drainage of the eastern side of the mountains.

---

[1] Thompson, D. G., Routes to desert watering places in San Bernardino County, Calif., and adjoining areas: U. S. Geol. Survey Water-Supply Paper — (in preparation).

The surface of Lanfair Valley has a gentle and nearly uniform outheastern slope from the head of these elevated valleys, above which the mountains, except one or two peaks, rise not more than ,000 feet.

The valley is drained at several places, principally through a wide ass 6 miles east of Blackburn, but partly through two narrow asses on the east and west sides of Hackberry Mountain. Nearly ll the drainage moves southward to a large valley that extends from Goffs southwestward to a closed basin several miles south of Cadiz (see Pl. V), the bottom of which is about 600 feet above sea level. A drainage line extends continuously from a point near Barnwell to a point several miles south of Cadiz, a distance of more than 75 miles.[1] This is one of the longest drainage lines in any closed basin in the desert region of southern California. A very small part of the drainage of the valley goes toward Colorado River by way of two canyons at its extreme eastern edge (see map, Pl. VI), where the old Government road to old Fort Mohave passes south of a small hill (marked B M 3789) 10 miles east of Lanfair. These canyons drain through Piute Wash into Colorado River a few miles north of Needles, a distance of about 30 miles. As the climate of the valley is arid and the soil is porous the rain that falls in it seldom if ever reaches the basin south of Cadiz or Colorado River as surface run-off.

GEOLOGY.

The geology of the region has not been studied in detail. The main mass of the New York Mountains and the Mid Hills is composed of granite, which is flanked on the north and northeast by metamorphosed limestone, quartzite, gneiss, and schist, into which it is intruded. The sedimentary rocks are shown on the geologic map of the State of California as of Cambrian age,[2] but Larsen has found one or two fossils in them which he believes to be Carboniferous.[3] At the south end of the Providence Mountains, near the edge of the area shown on Plate VI, the granite is intruded into limestone, which has been determined as Carboniferous.[4] The granite is part of a large intrusive mass that covers many square miles, extending at least as far as Marl Spring and Kessler Spring, west and northwest of Cima. In some of the low hills east of Blackburn and Vontrigger, granite, diorite, and altered limestone are found.[5]

Volcanic rocks, mostly of Tertiary age, are abundant around the edges of the valley. Purplish extrusives, probably rhyolite, occur on the road between Ivanpah and Barnwell, but their full extent there is not known. Rhyolite is found in the Castle Mountains, in the Hart mining district.[1] The Piute Range, forming an imposing steep-sided mountain on the east border of the valley, is composed of volcanic rocks, as are Hackberry Mountain and the low hills west of it. The flat-topped mesas at the east foot of the Providence Mountains are composed of similar extrusives. A prominent butte 2 miles north of Government Holes appears from a distance to be composed of the same series of light-colored rhyolites, latites, and tuffs as those seen in Table Mountain and the hills south of this mountain, which have been described by Darton as of Tertiary age.[2] The extrusive rocks of Table Mountain obviously lie on the old erosion surface of the granite which forms the main mass of the New York Mountains and Mid Hills. The volcanic rocks near Barnwell and in the Castle Mountains are perhaps of the same age as those along the east and south sides of the basin, but their erosion and weathering suggest that they are somewhat older. Buttes a short distance northwest and northeast of Lanfair were not examined but are believed to be composed of rhyolite. Part of Lanfair Valley is underlain at no great depth by lava of Tertiary or Pleistocene age, which rests on older gravel, and this lava may have covered a large area. Extrusive rocks of Pleistocene age are found elsewhere in San Bernardino County at places not far distant.

The greater part of Lanfair Valley is covered with detrital materials—sand, gravel, and boulders—washed down from the mountains on the west side of the valley. The depth of the alluvial material in the center of the valley is not definitely known, but well records indicate that in places it is not very thick and that it is underlain by volcanic material, below which at no great depth there are still other beds of gravel. Moreover, the hills of granite and lava that outcrop at many places in the valley indicate that in some places at least igneous bedrock lies at no great depth beneath the gravel floor. The gravel which has been penetrated at depths of 400 to 500 feet is older than the overlying igneous rocks, and is no doubt of late Tertiary or early Pleistocene age. This gravel may possibly be correlated with the red sandstone and conglomerate that outcrop on the Santa Fe Railway near Klinefelter and at other localities between that place and Colorado River. The sandstone and

Line of cross section, Fig. 3

conglomerate are believed by Darton[1] to be Pleistocene. One or two miles south of Barnwell several tongues of very coarse alluvial conglomerate, the boulders of which are mainly blue quartzite, extend out from the foot of the mountains. These tongues rise 15 to 50 feet above the general level of the slope. They are apparently older than the present alluvial deposits and have been exposed by faulting along the east edge of the mountains. They are probably of Pleistocene age, and may perhaps be correlated with the gravel that underlies the volcanic materials penetrated in the wells at Lanfair.

The northwestern slopes of the New York Mountains, the Mid Hills, and the Providence Mountains are much steeper than their southeastern slopes, and their rocky walls extend 1,000 to 2,000 feet lower on their northwestern than on their southeastern side. (See fig. 3.) These differences in slope might be explained by assuming that the mountain mass on the northwest side of Lanfair Valley is a large fault block that has been uplifted on its northwest edge and tilted down on its southeast edge, but not enough is known of the geology to permit this assumption.

Another explanation of the difference in the slope of the northwest and southeast sides of the mountains is based on meager

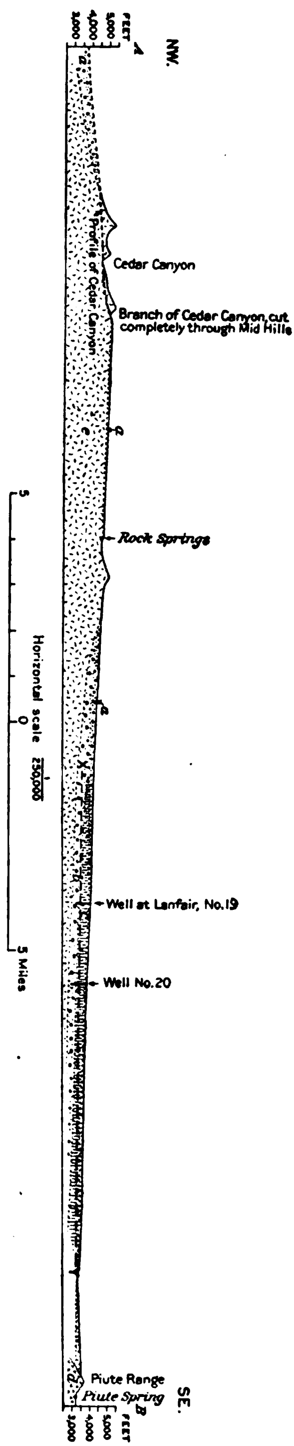

FIGURE 3.—Profile and hypothetical cross section of Lanfair Valley, Calif. *a*, Recent alluvial gravel, grading into *b*; *b*, older alluvial gravel of Pleistocene or Tertiary age; *c*, extrusives (lava, ash, etc.), Pleistocene or Tertiary, resting on *b*; *d*, volcanic rocks of Piute Range, probably Tertiary; *e*, granite of Mid Hills and New York Mountains. The volcanic rocks of the Piute Range act as a dam, west of which ground water is held under pressure. For the area east of Lanfair the dashed line X–Y marks the level to which water will probably rise in wells; for the area west of Lanfair it marks the probable depth to the water table.

[1] Darton, N. H., op. cit., pp. 146–147 and map 21.

evidence obtained from wells in Lanfair Valley. In two wells, one at Lanfair station and the other about a mile southeast of Lanfair, volcanic ash was said to have been reached at depths of 52 and 4 feet, respectively. In these wells the ash continued to depths of 520 and 410 feet, respectively, below which gravel was penetrated to a depth of 550 feet in each well. Material taken from the well at Lanfair, which was examined superficially by the writer, contained fragments of a rock that seemed to be rhyolite, although they were mixed with other materials, and there was no indication as to the depth from which the fragments of lava had come. In a well at Ledge (Maruba post office) water was reached at a depth of 365 feet and rose in the well to a point within about 100 feet of the surface. Though no information is available as to the strata penetrated in this well, the water-bearing bed is probably gravel which is overlain by a more impervious bed, perhaps volcanic rock. Volcanic rocks are abundant around the valley and form small outliers northwest and northeast of Lanfair. (See p. 32.)

These facts suggest that a thick bed of lava may occupy the valley at a comparatively slight depth below a cover of alluvial gravel, and that the lava was poured out at the time of the extrusion of the masses that form the Piute Range, Hackberry Mountain, and the buttes a short distance northwest and northeast of Lanfair. The gravel found at depths of 400 to 500 feet in the wells at Lanfair indicates that the floor of Lanfair Valley at one time stood at a much lower level, and that the southeast face of the New York Mountains and Mid Hills was probably once as precipitous as the northwest face is today. Faulting would thus not be involved in the explanation of the surface features of this large, high valley, but there has probably been much faulting in the mountains. Before the volcanic eruptions that produced the Piute Range, Hackberry Mountains, and the buttes northwest and northeast of Lanfair the area that is now Lanfair Valley was probably not so nearly inclosed as it is now. It was probably a part of a great alluvial slope that extended southeastward toward Colorado River, unbroken by the volcanic rocks that now border it on the east and south.

Lanfair Valley is limited on the east by the Piute Range, which forms a barrier that prevents the drainage from its northern part from going toward Colorado River. This range is composed of volcanic rock, is nearly flat-topped, and has almost vertical sides. It may be an uplifted fault block, or it may be a remnant of a large body of lava which was poured out on old gravel that is now deeply buried. In either case the drainage from the valley at some earlier period probably reached Colorado River. The mountains that form the southern boundary of the valley are also in large part of volcanic origin.

MINERAL RESOURCES.

A number of mines in the mountains around Lanfair Valley have een active at one time or another, but in 1917 very little mining was eing done. Gold is found in the Castle Mountains, near Hart, vhere a shaft 900 feet deep had been sunk in 1917, and about 20 men vere employed. The ore is said to be rich in spots. A mill had been uilt, but it was not being operated in the later part of 1917. Deosits of tungsten are found on the southeast side of the New York Mountains, but they have not yet been much developed.[1] Gold, coper, tungsten, and some vanadium, are found in the hills east and ortheast of Vontrigger station, and considerable mining has been lone in this district.[2]

CLIMATE.

In 1917 practically all the large number of homesteaders in Lanfair Valley were trying to raise crops by dry farming. The degree of success attained in dry farming is determined largely by natural and uncontrollable conditions of climate and soil, especially of climate. The main features of climate to be considered by the dry farmer are the average annual precipitation, the distribution of precipitation through the year, the character of the precipitation, the evaporation, and the temperature.

Unfortunately, no reliable records are available for Lanfair Valley. The United States Weather Bureau has published observations made at Jean, Nev., about 45 miles north of Lanfair; at Searchlight, Nev., 50 miles northeast of Lanfair; at Needles, Calif., about 40 miles southeast of Lanfair; and at Bagdad, Calif., about 50 miles southeast of Lanfair.[3] In addition, Mr. E. L. Lanfair kindly furnished the writer with incomplete records of precipitation at Lanfair for the period from March, 1912, to March, 1915. These records are given on page 36.

The great variation in climate within comparatively short distances in the arid regions of the Southwest, due in large measure to the influence of surface features, prevents close comparison between the climate at Lanfair and at the points mentioned above, but the records at these places afford some information of value. The average annual precipitation at these places is given in the accompanying table:

[1] Mines and mineral resources of San Bernardino County, p. 68, California State Min. Bur., 1917.
[2] Idem, pp. 11, 69–78.

[a] Based on data given in Climatological data for the United States by sections, 1914 to 1917, U. S. Dept. Agr. Weather Bur., and records for Lanfair given below.
[b] No record for one or more months in certain years. The average given is therefore probably slightly below the true facts.

A record of the precipitation at Lanfair from March, 1912, to March, 1915, furnished by Mr. Lanfair, is given in the following table:

Monthly precipitation, in inches, at Lanfair, Calif.

[Elevation about 4,040 feet.]

Year.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Annual.
1912	(a)	(a)	3.60	0.68	0.13	0.00	0.60	0.25	(b)	1.28	(b)	0.10	[e] 6.64
1913	0.39	[c] 2.98	(d)	(d)	(d)	(d)	1.29	1.43	0.63	(b)	1.56	(b)	[e] 8.28
1914	2.32	3.39	.53	1.01	(b)	.46	1.06	.19	2.29	3.16	(b)	(b)	[e] 14.40
1915	.30	5.70	(a)	(a)	(a)	(a)	(a)	(a)	(a)	(a)	(a)	(a)	......

[a] No record.
[b] It is not clear from Mr. Lanfair's record whether an absence of data for certain months indicates no precipitation or a suspension of observations; probably no precipitation.
[c] Does not include a 6-inch fall of snow on Feb. 22, which was not measured in inches of rain.
[d] It is not clear whether the absence of data for the months of March, April, May, and June, 1913, indicates no precipitation, but the nature of the record suggests that no observations were made during these months.
[e] Record for year probably incomplete.

As the record for Lanfair is not complete for any single year, it furnishes no ground for definite conclusions, but the information it gives, scant as it is, if studied in connection with the records at the Weather Bureau stations mentioned above, brings out the fact that the precipitation in Lanfair Valley is similar to that in other parts of the desert region in the following respects: (1) Most of the precipitation comes late in the fall, in the winter, and early in the spring; (2) there is great variation both in the average precipitation for any given month during a period of years and for the average annual precipitation; (3) the precipitation varies considerably from place to place on a given date. The precipitation in summer very often comes in the form of violent thunderstorms, and in one of these storms the rainfall in a few hours may be so abundant as to make up what would otherwise be a deficiency for the year, or to produce an excess of several inches above the normal annual rainfall. At another point a few miles away the storm may produce little or no precipitation. On the other hand a larger proportion of the rain seems to fall in summer at Lanfair than at the other observation stations, but this apparent difference may be due only to the fact that the record at Lanfair covers a period so short that it does not accurately represent the normal rainfall. The average annual precipitation at Lanfair, as shown by the very incomplete records given, also seems to be somewhat greater than at other observation stations within 50 miles of it.

The first table shows that in general the precipitation is greatest where the altitude is highest, and that it decreases with the decrease in altitude, a fact that accords with observations made in other parts of the United States. The moisture-laden winds, in moving across the land, rise to high altitudes in passing over mountains and other elevated regions, such as Lanfair Valley, and as the temperature of the air is decreased as it rises and its moisture-bearing capacity is therefore also decreased, its moisture is condensed and precipitated. As the winds again descend to lower levels on the leeward side of the mountains they become warmer and can absorb more moisture, so that evaporation rather than precipitation occurs. As Lanfair Valley stands at a high altitude the precipitation in it should be somewhat greater than that at the other places mentioned. Similarly, because of their greater altitude the precipitation in the New York Mountains and Mid Hills would be greater than at Lanfair, especially as the prevailing winds in the valley are from the west and as Lanfair is on the leeward side of the mountains. Settlers in the valley state that the precipitation at Lanfair is actually less than at points farther west, on the eastern slope of the mountains. In winter, especially, several inches of snow will fall in the mountains while practically no rain or snow falls at Lanfair.

Evaporation is an important element in the climate of the desert region of California, of which Lanfair Valley is a part, because of the high temperature and resulting low relative humidity and because of the frequent winds, which aid greatly in drawing moisture into the atmosphere.[1] The evaporation is very great during the summer, and is considerable even in winter. Much of the rain that falls in Lanfair Valley is doubtless evaporated within a few hours and is not available for use for agriculture.

No records of temperature at Lanfair are available, but the conditions there are probably somewhat similar to those in other parts of the desert. High temperature occurs during the day in summer, but the daily range is considerable, and the nights are cool. Because

[illegible]

of the high altitude, the maximum summer temperatures are probably not so high as those at lower levels. At Searchlight, 50 miles northeast of Lanfair, for instance, at an altitude of 3,445 feet, the maximum temperature during the years 1914 to 1917 was 104°, but at Needles, 40 miles southeast of Lanfair, at an altitude of only 447 feet, the temperature in each of the same four years reached 111° or more. The winters are comparatively mild, there being many days without frost, but low temperatures, from 10° to 20° above zero, occur occasionally. The winters at Lanfair are probably slightly colder, and frosts are probably more common than at lower levels.

The influence of the climate on the prospects of agricultural development of Lanfair Valley is considered on pages 46–48.

VEGETATION.

The vegetation of Lanfair Valley is very different from that of the Ivanpah and other valleys to the north and of the region to the south and southwest. It is characterized by an abundance of spine-bearing forms, such as the cactus commonly called cholla, which grows profusely, the yucca, known as the Spanish dagger, and the Joshua tree, or giant yucca. Arid-land grasses are also found, such as "galleta" and a form known as "grama grass." In the branch valley that lies west of Government Holes, more than 5,000 feet above sea level, there is a flourishing growth of sage brush (*Artemisia tridentata*)[1] and piñon, and probably some juniper. The creosote bush, *Covillea* (*Larrea*) *tridentata*, which is the prevailing species in most of the adjoining region, is very rare; it was noticed by the writer only on the north side of Hackberry Mountains near Blackburn and in one small tract near Ledge. Catsclaw was seen in washes just west and south of Blackburn. None of the forms indicating ground water at slight depth, such as mesquite and salt grass, were seen.

SOURCE OF GROUND WATER.

There are no permanent streams in Lanfair Valley, nor any which flow except immediately after storms. The water supply of the region is derived entirely from the rain and snow that fall in the valley and from the ground water, which is derived from precipitation. As this valley lies higher than any of the surrounding valleys it evidently receives no ground water from outside areas. The quantity of water now beneath the surface or that is now or will be available for domestic use for irrigation is limited by the amount of precipitation. No definite figures can be given to show the quantity

[1] Specimens of sagebrush collected in the field were identified by Miss Alice Eastwood, California Academy of Science, San Francisco.

of water available for use, but some significant facts may be considered.

Evaporation disposes of a large part of the rain in desert regions, such as Lanfair Valley, where much of it falls a little at a time, a few hundredths to a few tenths of an inch. The soil is usually so dry that it is seldom moistened to depths of more than an inch or two. Much of the rain evaporates soon after it falls, and only when rain falls steadily for a number of hours or when a large amount falls in a short time, as during a heavy thunderstorm, does any of it percolate deep enough to replenish the ground water.

It is only during the occasional heavy rains that some of the water becomes surface run-off. In the mountains, where there is little soil to absorb the rain and the rocks are nearly impervious, the run-off may then be considerable. On alluvial slopes, such as compose a large part of Lanfair Valley, the rather porous detrital material absorbs large amounts of water, and the run-off is relatively small. Most of the run-off from the mountains is absorbed on the alluvial slopes and even a large part of the run-off that is concentrated into definite streams eventually sinks into the alluvial material.

Only about one-fifth of Lanfair Valley is occupied by mountains. Some of the precipitation that falls on the north slope of Hackberry Mountain and the adjoining hills and the west slope of the Piute Range during heavy rains is immediately carried out of the basin as surface run-off. A number of springs in the New York Mountains and Mid Hills indicates that some of the water that is absorbed by the rocks and soil in the mountains is returned to the surface and removed by evaporation. Water is obtained at moderate depths in a number of wells in the mountains or in the wide valleys west and north of Rock Spring. Some of the precipitation in the mountains obviously does not enter the porous detrital material of the alluvial slopes but is held in pockets in the rock beneath the soil. Furthermore, water percolates into the alluvial material only when rain falls for a long time or in heavy storms, so that much of the annual rainfall does not replenish the ground-water supply.

GROUND WATER IN UPPER PART OF VALLEY.

Water is found at a number of places in the New York Mountains and Mid Hills at comparatively slight depths. At Barnwell the Rock Springs Cattle Co. has dug a well (No. 1),[1] 62 feet deep, in which water stands 48 feet from the surface. On the west side of the railroad at Barnwell there are two wells, one about 60 feet deep and the other about 90 feet deep, but the depth to water in them is not

[1] The numbers given in the text correspond to those given on the map, Pl. VI, and in the table on pp. 48–49.

known. At this station the Atchison, Topeka & Santa Fe Railway Co. in 1905 drilled a well 457 feet deep (No. 2), which is now abandoned. The depth to water in this well was 73 feet, and the supply was ample. During a pumping test of 24 hours the well furnished 20 gallons a minute. The well was probably abandoned because the water was unsuitable for use in locomotive boilers. The Lecyr well (No. 3) is dug in a sandy wash. When visited by the writer it was tightly covered and could not be measured, but the pumping equipment indicates that the depth to water is probably not great. Two miles west of Government Holes, about 200 feet northwest of the junction of the road from this place with a road leading to Cima, by way of Cedar Canyon, is a well dug in granite (No. 15). In the later part of November, 1917, the water stood 4 feet from the top of this well. A few feet west of the well was a slight depression in granite, about 15 feet in diameter, containing water about a foot deep. A mile south of this well, at the ranch of A. E. Moore, is a dug well (No. 16), 12.7 feet deep, in which the depth to water is 7.2 feet. Government Holes (No. 14) is a well 32 feet deep, dug at the foot of a granite hill. The depth to water is 15 feet. There are three shallow wells near Rock Springs, but they were not visited by the writer. The most northerly of these is the Beaty well (No. 11), which is said to be about 30 feet deep and in January, 1918, was reported to contain only 18 inches of water. The middle one of the three, called the Emdee well (No. 12), is said to be 18 feet deep and to contain 8 feet of water. The third well (No. 13) is near the shaft of the Barnett Mining Co. The depth to water is reported to be about 8 feet. The depth of the well is not definitely known but is probably about 20 feet.

The quantity of water available in any of these wells is apparently not great. The well of Mr. Moore (No. 16) yields 11 gallons a minute, and if the pumping is increased the well is pumped dry. The largest quantities pumped from the Emdee and Barnett wells are about 1,000 gallons a day each. Although the actual capacity of these wells is not known they could probably be pumped dry easily with power pumps. All the wells mentioned above that are west and southwest of Rock Springs are near the foot of granite hills, where solid rock lies close to the surface. They are apparently supplied from rain water, which percolates downward to the surface of the solid rock, along which it moves toward lower levels. If the wells mentioned were pumped heavily the water level would probably be lowered considerably, as the small tracts in which the wells are dug do not contain a sufficient supply to withstand heavy drafts.

During years of normal precipitation the water in the ground is sufficient to keep the water table rather near the surface, and in some places it returns to the surface in springs, such as Rock Springs, which are in a small canyon that heads in the wide valley west of the springs. During a series of unusually dry years the supply of ground water would probably be rapidly diminished. At the end of the dry fall of 1917, Rock Springs were practically dry, and other springs in the New York Mountains and Mid Hills were also reported to be dry.

GROUND WATER IN MAIN PART OF VALLEY.

In the main part of Lanfair Valley the depth to the water table is apparently much greater than in the marginal parts, where rock lies close to the surface and prevents the rain water from sinking to great depths. Information is available concerning only three wells drilled on the alluvial slopes that compose the surface of the greater part of the valley. As far as is known, no other wells have been drilled on these slopes. At Ledge (Maruba post office) Mrs. E. J. Jacoby has drilled a well (No. 9) 879 feet deep. Water was struck at a depth of 365 feet and rose within about 100 feet of the surface. The well furnishes about 20 gallons a minute. No log of the strata penetrated is available. At Lanfair Mr. E. L. Lanfair has drilled a well (No. 19) 550 feet deep. Gravel was penetrated to a depth of 52 feet, below which the materials encountered to a depth of 520 feet were described as volcanic ash. Fragments of the drill cuttings examined by the writer seemed to be a rhyolitic rock. A bed of water-bearing gravel was entered at a depth of 520 feet and extends to the bottom of the well. The water rose within 500 feet of the top. Mr. Lanfair has drilled another well (No. 20), also 550 feet deep, about a mile southeast of the one just described. In this well volcanic ash was struck at a depth of only 4 feet and extended to a depth of 410 feet, where gravel was found, which reached to the bottom of the well. Water was found in the gravel at 410 feet and rose 10 feet in the well.

Though the data afforded by the wells in the valley are meager they disclose three important facts:

First, the depth to water is great.

Second, the water is confined in deeply covered gravel under sufficient pressure to rise somewhat in wells when the overlying beds are penetrated, but not under sufficient pressure to rise near the surface. Unfortunately, the data available are too incomplete to suggest the heights to which the water might rise in wells drilled at different points in the valley. The conditions mentioned above, together with the occurrence of large masses of volcanic rock on the borders of the valley, indicate that a large part of the alluvial slope is underlain at a slight depth by volcanic material. (See fig. 3, p. 33.) In both of Mr. Lanfair's wells this material was reported as volcanic ash, but it may include ash, tuff, rhyolite, or other extrusive rocks.

Third, the fact that the water rose higher in the well at Ledge than in the well at Lanfair indicates that the underground conditions are not uniform throughout the valley—that some underground structure affects the ground-water level. Low hills 3½ miles northeast of Lanfair and a low ridge that extends from the Castle Mountains to a point about 4½ miles south of Hart indicate that a rock barrier may cross the deeply buried gravel in such a way as to dam the water west of these hills, so that it is held under greater pressure than the water on the lower side of the barrier.

The great depth to water in Lanfair Valley is due chiefly to the high elevation of the valley above the bottom of the basin into which it drains—the basin south of Cadiz—and to the steepness of the alluvial slope. The water in the detrital material is drained toward Goffs and thence to the basin near Cadiz. Data furnished by the Atchison, Topeka & Santa Fe Railway Co. in regard to the level of water in its wells shows that the water table in the valley both southwest and east of Goffs lies at a considerable depth. At Goffs the depth to water in 1917 was 606 feet; at Homer, in 1902, it was 608 feet; at Fenner, in 1906, it was 460 feet; and at Danby, in 1903, it was 268 feet. Thus, the conditions facilitate the draining away of any large quantity of water that might pass into the upper gravel in Lanfair Valley.

Not only is some ground water being lost by percolation toward Goffs, but some may be coming to the surface in springs. As nearly as could be ascertained Piute Spring (No. 23) is just outside of the eastern border of the area shown on the map (Pl. VI), in a canyon south of the hill marked "B. M. 3789," about 11 miles from Lanfair. This canyon has been cut back so far that it receives some drainage from Lanfair Valley. The spring was not visited by the writer, but it is said to be one of the strongest in San Bernardino County, the water flowing down the canyon for nearly a mile. This spring is below the level to which water rises in the wells at Lanfair, and the strong flow may come from the gravel, which is deeply buried at that place.

In November, 1917, several persons planned to drill wells in the near future, but as late as June, 1918, none of them had done any drilling. A number were confident that wells drilled about 3 miles west of Lanfair would find water at depths of less than 200 feet, because the surface drainage here goes southward, toward Hackberry Mountain, which, they believed, holds the ground water at a somewhat higher level than at Lanfair, it being assumed that the ground water moves in the same direction as the surface flow. The land on which these wells would be drilled lies 200 to 400 feet above the base of Hackberry Mountain, so that even if the water table on the north side of the mountain is near the surface the depth to water in the wells would still be great. Moreover, there are no indications that the water table at the foot of the mountain is close to the surface. Water does not come to the surface in the short canyon between Blackburn and Vontrigger, through which much of the surface run-off goes, nor is there any vegetation in this canyon—such as running mesquite and arrow weed—to indicate that water lies near the surface. Although the depth to the water table is doubtless much less in this canyon than at Lanfair, it is probably at least 50 feet, and at points farther northwest, up the alluvial slope, it increases. Unless some concealed structure causes the water level to stand higher here than at Lanfair, and there are no surface indications of any such barrier, the depth to water at places 3 or 4 miles west of that town will probably be fully as great as it is in the wells described.

At Lanfair the water-bearing bed slopes less steeply than the surface. If it bears the same relation to the surface in areas near the south and southeast borders of the valley, where the low mountains may tend to hold the water back, it will probably lie not so deep in these areas as at Lanfair, a probability indicated by Piute Spring, but as only a little information is available, and as that indicates that the depth to water on the alluvial slopes is great, no one should begin to drill a well unless he is prepared to go to a depth of 300 to 500 feet.

QUALITY OF WATER.

Samples of water from three wells (Nos. 3, 9, and 16 on Pl. VI) in Lanfair Valley were collected by the writer and were analyzed in the water-resources laboratory of the United States Geological Survey. An analysis of water from a well (No. 2) drilled at Barnwell by the Atchison, Topeka & Santa Fe Railway Co. but now abandoned was furnished by that company. The results of the analyses are given in tables on page 50, where the waters are classified according to their quality for domestic, boiler, and irrigation use.[1]

The suitability of a water for domestic use depends on its acceptability for drinking, washing, and cooking. Hard waters can be used for drinking but are unsatisfactory for cooking and especially for washing. Waters whose hardness exceeds 200 parts per million (in terms of $CaCO_3$) are not satisfactory for washing. Waters whose hardness exceeds 1,500 parts per million are undesirable for cooking. The presence of approximately 200 parts per million of the normal

[1] See Mendenhall, W. C., Dole, R. B., and Stabler, Herman, Ground water in San Joaquin Valley, Calif.: U. S. Geol. Survey Water-Supply Paper 398, pp. 56–58, 65–69, 73–82, 1916, for a detailed discussion of the classification of waters for different uses.

carbonate radicle, 250 parts of the chloride radicle, or 300 parts of the sulphate radicle, can be detected by taste. Waters that contain considerably more of these constituents can be tolerated by a human being, but those that contain more than 300 parts per million of the carbonate radicle, 1,500 parts of the chloride radicle, or 2,000 parts of the sulphate radicle are intolerable to most people. Local conditions and individual preference, however, largely determine the significance of the terms "good" or "bad" as applied to the mineral quality of water for domestic use. In a desert region a water having 240 parts per million of hardness (expressed as $CaCO_3$) might be classed as fair; in a region where the supply is abundant and the general quality is much better, as in the New England States, the same water would by most users be classed as bad. It should be borne in mind that in this report the classification of a water for domestic use is based only on its mineral content; it does not indicate the sanitary quality of the water. A water may contain only 100 parts per million of total solids in solution and yet be so badly polluted as to be unfit for drinking.

With respect to their quality for use in boilers, waters are classified according to the amounts of their scale-forming (incrusting) and foaming constituents and the probability of corrosion. The following rating of boiler waters is adapted from that suggested by the American Railway Engineering and Maintenance of Way Association, but the amounts are recomputed to parts per million.

Ratings of waters for boiler use according to proportions of incrusting and corroding constituents and according to foaming constituents.

Incrusting and corroding constituents.		Foaming constituents.	
Parts per million.	Classification.[a]	Parts per million.	Classification.[b]
Less than 90	Good	Less than 150	Good.
91 to 200	Fair	151 to 250	Fair.
201 to 430	Poor	251 to 400	Bad.
More than 430	Bad	More than 400	Very bad.

[a] Am. Ry. Eng. and Maintenance of Way Assoc. Proc., vol. 5, p. 595, 1904.
[b] Idem, vol. 9, p. 134, 1908.

With respect to their value for irrigation, waters are classified according to their content of alkaline salts. Water containing large quantities of alkaline salts is injurious to vegetation because, through evaporation, the alkali[1] collects in the few inches of top soil in quantities so large as to interfere greatly with the growth of plants. The value of a water for irrigation as determined by the

[1] The term "alkali" is used to designate the common soluble salts formed on the evaporation of natural waters. Sodium carbonate (sal soda), or "black alkali," and sodium sulphate (Glauber's salt) and sodium chloride (table salt), or "white alkalies," are the principal alkaline salts.

amount of alkali it contains is expressed by its "alkali coefficient,"[1] which is defined as the depth of water in inches which, on evaporation, would yield sufficient alkali to render the soil to a depth of 4 feet injurious to the most sensitive crops. The alkali coefficient affords a purely arbitrary means of comparing waters used for irrigation. It does not take account of the methods of irrigation and of drainage, the character of the soil, and the kind of crop, but it indicates very well the general suitability of any water for irrigation. The waters in the areas here discussed have been classified as to quality for irrigation in accordance with the following rating:

Classification of water for irrigation.[a]

Alkali coefficient (inches).	Class.	Remarks.
More than 18	Good	Waters have been used successfully for many years without special care to prevent accumulation of alkali.
18 to 6	Fair	Special care to prevent gradual accumulation of alkali has generally been found necessary except on loose soils with free drainage.
5.9 to 1.2	Poor	Care in selecting soils has been imperative and artificial drainage has frequently been found necessary.
Less than 1.2	Bad	Waters practically valueless for irrigation.

[a] Stabler, Herman, Some stream waters of the western United States, with chapters on sediment carried by the Rio Grande and the industrial application of water analyses: U. S. Geol. Survey Water-Supply Paper 274, p. 179, 1911. See also U. S. Geol. Survey Water-Supply Paper 398, p. 57, 1916.

The waters analyzed range in total content of solids from 229 to 1,992 parts per million, but three of them contain less than one-half as much mineral matter as the fourth. The most highly mineralized water, that from the Lecyr well (No. 3), is used only for cattle. The classification shows that the water from the Lecyr well is bad for domestic use because of its extreme hardness and its high content of sulphate. It would be considered unfit for use in boilers on account of its tendency to form scale and to foam, and it could not be improved economically by chemical treatment. It has, however, been classed as fair for irrigation. It is essentially a calcium-sulphate water, such as is found near gypsum deposits, although no such deposits are known to exist in the region.

The water from the well of Mrs. E. J. Jacoby, at Ledge (No. 9), is good for domestic use and for irrigation but is of only fair quality for use in boilers because of its rather large content of scale-forming constituents. This water comes from a depth of about 365 feet. The water from the deep wells at Lanfair is probably somewhat similar to it.

The water from the well of A. E. Moore (No. 16), the only other water used for domestic purposes, is of fair quality for drinking and

[1] Stabler, Herman, Some stream waters of the western United States, with chapters on sediment carried by the Rio Grande and the industrial application of water analyses: U. S. Geol. Survey Water-Supply Paper 274, pp. 177–179, 1911.

cooking but will cause trouble in washing because of its hardness. It is poor for boiler use because of its high content of scale-forming and foaming constituents, and it might possibly corrode boilers. This sample probably represents the water obtained from shallow wells in the high valleys on the western edge of Lanfair Valley.

The water from the abandoned well of the Atchison, Topeka & Santa Fe Railway at Barnwell (No. 2) is of fair quality for drinking and cooking, but because of its hardness it is not very satisfactory for washing. It is bad for boiler use because of its large amount of scale-forming constituents and its tendency to corrode boilers. The well was probably abandoned because its water was of poor quality for use in locomotive boilers.

The results of the four available analyses of water from wells in this valley appear to show that the ground water is satisfactory for use in irrigation.

WATER SUPPLY FOR AGRICULTURE.

Although many homesteaders were living about Lanfair in 1917, only three of them possessed their own domestic water supplies. The others were forced to haul water for all purposes, often having to pay for it. A number of them hauled water from the wells west of Rock Springs and from springs in the mountains. Some of the springs are controlled by a large cattle company and there has been friction between the ranchers and the cattlemen over the water.

Most of the settlers have attempted dry farming. The crops that have been tried include milo maize, varieties of field corn, and beans. The small grains have been sown in the fall, and the corn and beans in the spring. Some fair crops have been obtained, the most successful of which were grown well up on the alluvial slope, a short distance east of Rock Springs—that is, in that part of the valley where the rainfall is usually greatest because of the influence of the mountains. None of the crops have proved as successful as had been hoped.

Success in dry farming depends upon the knowledge and skill that may be called technique [1] and upon climatic conditions—such as the average annual precipitation, the seasonal distribution of precipitation, the nature of the precipitation (that is, in heavy showers or in small amounts), and the evaporation—and on the soil, the nature of which determines the quantity of water that enters the ground. These have already been considered (pp. 35–39).

[1] Clothier, R. W., Dry farming in the arid Southwest: Univ. Arizona Agr. Exper. Sta. Bull. 70, 1913. This paper discusses the methods of dry farming and gives the results of experiments in Arizona. It contains much valuable information for the prospective dry farmer.

Incomplete records at Lanfair for short periods give an average annual precipitation of less than 10 inches, and longer records for the region around Lanfair Valley show that the average annual precipitation is probably not more than this amount. Dry farming has generally been considered impracticable where the precipitation is as low as 10 inches and where the evaporation is as great as it doubtless is in Lanfair Valley.[1] The rainfall at Lanfair, as shown in the table on page 36, is not confined principally to any season but is distributed through the year, some of it coming when it can do no appreciable good. The record for the years 1912, 1913, and 1914 shows that from 17 to 33 per cent of the annual precipitation came in amounts of less than half an inch in 24 hours. These light showers add very little water to the soil, although they may help plants that are growing.[2] On the other hand, some of the rain falls in heavy thundershowers, when it may do more damage than good.

Unfortunately, the climatic observations in Lanfair Valley are very imperfect and are not strictly reliable. They cover a period so short that they are not of much value to any one who is trying to reach conclusions as to the possibility of carrying on successful dry farming. The prospects of the dry farmer in the valley do not seem to be very good. At the best, he will be laboring precariously in that borderland which separates success from failure. Fair crops may be raised in the wettest years, and possibly in years of normal precipitation, but it is certain there will be years when the rainfall is so deficient that crops will fail. Those who attempt to develop this valley by dry farming should have sufficient financial backing to carry them over a number of years, and until they can prove that crops can be raised without irrigation they should consider their work an experiment.

Only a little irrigation has been attempted in Lanfair Valley. Mrs. E. J. Jacoby has used water from her well at Ledge to irrigate about an acre of melons and garden truck. Mr. A. E. Moore has irrigated a few fruit trees at his ranch, 2 miles southwest of Government Holes (well No. 16, Pl. VI), but he states that the climate is too uncertain early in the spring to allow the trees to thrive. Mr. Moore used water from a shallow dug well, which yields about 11 gallons a minute. In the high valleys west and northwest of Rock Springs the supply from the shallow wells is doubtless sufficient for household use and for the irrigation of small tracts, but it would be insufficient to irrigate a large tract. In this part of the region, however, because of the high altitude, the precipitation is probably con-

[1] Briggs, L. J., and Beltz, J. O., Dry farming in relation to rainfall and evaporation: U. S. Dept. Agr. Bur. Plant Industry Bull. 188, p. 8, 1911. This bulletin deals with the conditions affecting dry farming that are not within the control of the farmer and that should be understood by him.

[2] Idem, p. 15.

siderable, so that if proper methods are used a large amount of water would not be required. The water from Vontrigger Spring (No. 22) was used in 1917 by Mrs. M. L. White to irrigate about 140 peach, apple, and other fruit trees, and some grapes on her ranch half a mile south of the spring. The spring fills in about 60 hours a concrete reservoir having a capacity of about 20,000 gallons. In November, 1917, the trees had been planted 2½ years and had produced good fruit. Mr. Lanfair, who owns the well at Lanfair and the well about a mile southeast of it, expected to irrigate a few acres in 1918 with water from a spring in the mountains 8 miles west of his ranch. The water is piped to a concrete reservoir near the railroad, having a capacity of about 15,000 gallons. The spring furnishes about 1,000 gallons a day.

The ground water in the valley seems to be satisfactory for irrigation, but the supply is apparently nowhere sufficient, and the cost of the high lift required to bring the water to the surface in the main part of the valley prohibits its use for irrigation, except possibly for especially valuable crops, such as garden produce or fruit trees. The conditions are not favorable for the development of practical irrigation. Wells for domestic supply and for watering stock can probably be obtained throughout the valley, but because of the great depth to which they must be drilled their cost will be rather great.

WELL DATA AND ANALYSES.

Data in regard to the wells in Lanfair Valley and the results of analyses of water from four wells, with a classification of the waters for domestic, boiler, and irrigation use, are given in the following pages:

Record of wells and springs in Lanfair Valley, Calif.

GROUND WATER IN PAHRUMP, MESQUITE, AND IVANPAH VALLEYS, NEVADA AND CALIFORNIA.

By Gerald A. Waring.

INTRODUCTION.

In eastern California and southern Nevada there are numerous detached drainage basins that have no outlets for their surface water. The lowest parts of these basins are occupied by clay flats which may be covered with water during wet seasons but which are dry during the greater part of the year. These flats are known as playas or "dry lakes." Pahrump, Mesquite, and Ivanpah valleys occupy three such inclosed basins, partly in Nevada and partly in California. (See Pls. VII and VIII.)

The drainage basin of Pahrump Valley is mainly in Nye and Clark counties, Nev.; a small portion of it lies in Inyo and San Bernardino counties, Calif. (See Pl. VIII.) Somewhat less than half of the drainage basin of Mesquite Valley lies in Clark County, Nev., and the remainder is in California, chiefly in San Bernardino County but partly in Inyo County. About 57 per cent of the drainage basin of Ivanpah Valley is in San Bernardino County, Calif., but the lowland as well as the bordering slopes extends northward into Clark County, Nev. The areas of the drainage basins of Pahrump, Mesquite, and Ivanpah valleys, by planimetric measurement on the topographic maps of the region, are, respectively, 1,040, 395, and 770 square miles.

There are no perennial streams of consequence in any of the basins, but numerous small springs furnish water supplies for prospectors and for range stock, and at two places in Pahrump Valley there are large springs used for irrigation. Within the last few years attempts have been made in each valley to develop supplies of water for irrigation by sinking wells. Although the preliminary tests did not result in agricultural settlement of the valley lands, attempts to develop ground water for irrigation have been continued, and the writer was assigned to make a short examination of the region, in order to determine, if possible, the relative amount of ground water available and its adaptability to successful farming. A short time in August, 1916, was spent by the writer in the examination of the valleys, in company with Ernest L. Neill, of Stanford Un who rendered able assistance in gathering information. Th tion of well records and other data during the short time th be spent in the region was greatly facilitated in Pahrump V Messrs. T. G. Darrough, J. M. Raycroft, Albert Quill, Ho Vetter, and T. J. Donovan; in Mesquite Valley by Mr. J. B. and in Ivanpah Valley by Mr. Ruben Fuchner. Some ad data were collected in 1917 by D. G. Thompson, of the Unite Geological Survey.

Ivanpah Valley is traversed by the Los Angeles & Salt La road. At Cima, Ivanpah, and Nipton there are small sto limited accommodations for travelers. Roach, a settlement o dozen houses, is a shipping point for ore and affords meals commodations for the night. Jean, the principal settlement valley, is a mining supply and shipping point, with a large store, warehouse, post office, hotel, saloon, and a dozen d houses. From Jean a narrow-gage railroad extends northwe to the mining settlement of Good Springs, which in 1916 had a lation of perhaps 200, and to the Yellow Pine or Bybee mine, farther west. From Good Springs and Roach well-graded roads extend to Platina, in Mesquite Valley. This town, whic started in 1914 during local excitement over the discovery of num in the adjacent hills, consisted in 1916 of a general sto post office and seven other houses along streets laid out about a ter of a mile north of the former Ripley post office and an distance southeast of the abandoned mill of Sandy. The stor post office were discontinued, and the town was practically aband At the Milford mine and other mines in the mountains ea Platina there were small groups of tents and cabins of tho gaged in getting out ore. From Platina roads lead northwestwa Manse and Pahrump ranches, the principal settlements in Pah Valley. In 1916 Pahrump post office had mail service three ti week with Shoshone, a station 27½ miles to the southwest, on the T pah & Tidewater Railroad. The small mining settlement of Jo is near the north border of the Pahrump Valley.

The old copper smelter at Valley Wells, 20 miles northwe Cima, was rebuilt by the Ivanpah Copper Co. late in 1917, and in operation as late as February, 1918, when about 50 men were w ing there. The smelter was later reported to have been closed d Because of fluctuations of the metal market and other conditions future of many mining camps is very uncertain, and a traveler is going into a region for the first time should make inquiries reg ing the presence of settlers and not depend on finding peopl places where settlements have flourished in the past.

GEOGRAPHIC SKETCH.

TOPOGRAPHY.

Spring Mountain, a range that culminates in Charleston Peak, at an elevation of 11,910 feet above sea level, is the dominant topographic feature of the region. The east side of the range is characterized by great cliffs. The west side, which is in the Pahrump drainage basin, is somewhat less precipitous and is bordered by extensive alluvial slopes. (See Pl. IX, *A*.) The lowest part of the Pahrump basin is in the northwest, in a reentrant known as Stewart Valley (Pl. IX, *B*), at an elevation of about 2,450 feet. The southwest border of the Pahrump basin is formed by the steep slopes of the Nopah Range, which rises 2,000 feet above the valley, and by subsidiary ranges to the north and south. The drainage divide between the Pahrump basin and that of Ash Meadows, to the northwest, follows the crests of several semidetached, unnamed mountains that attain elevations of 4,000 to 5,000 feet above sea level. On the southeast the Pahrump basin is separated from the Mesquite basin by a drainage divide that extends from the crest of Spring Mountain down the alluvial slopes and across the lowland as an indefinite divide, to the base of a northeastern spur of the Kingston Range.

The Mesquite drainage basin, which is rudely triangular, has its northern, southern, and western corners, respectively, near Potosi Mountain, Clark Mountain, and Kingston Peak. The highest point in the basin is Potosi Mountain, at an elevation of 8,500 feet above sea level; the lowest land is in the dry Mesquite Lake, at an elevation of about 2,535 feet. The divide on the east is formed by a southward extension of Spring Mountain; on the southwest by lower mountains. Between spurs of these mountain ranges on the east and the southwest, wide alluvial slopes extend down to the lower land at grades of 100 to 400 feet to the mile.

The western border of the Ivanpah drainage basin, which lies south of Mesquite basin, is formed by Clark Mountain (elevation, 7,903 feet) and adjacent ranges, and by Ivanpah Mountain, whose main peaks are more than 5,500 feet above sea level. On the east the limit of the drainage basin is formed in part by the crest of the Bird Spring Range, Sheep Mountain, and the McCullough Range. From the south end of the McCullough Range the divide swings southwestward along the crest of the New York Mountains. The extreme northern limit of the Ivanpah basin is definitely marked by the summit of Potosi Mountain. The extreme southwestern limit is less definitely determined by alluvial slopes on each side of the railroad pass at Cima. The lowest portion of the basin is occupied by the dry Ivanpah Lake, at an elevation of 2,595 feet, separated by a slight divide from the dry lake near Roach, whose surface is 13 feet higher.

The surface in each basin may be divided into three parts—lowland, alluvial slopes, and mountains. The approximate areas and percentages of each class are shown in the following table:

Area of land of different classes in Pahrump, Mesquite, and Ivanpah basins.

	Lowlands.		Alluvial slopes.		Mountains.		Total area of basin (square miles).
	Area (square miles).	Per cent of total area.	Area (square miles).	Per cent of total area.	Area (square miles).	Per cent of total area.	
Pahrump basin	250	24	330	32	460	44	1,040
Mesquite basin	90	23	115	29	190	48	395
Ivanpah basin	85	11	375	49	310	40	770

It will be noted that the proportion of lowland, alluvial slopes, and mountains are approximately the same in the Pahrump and Mesquite basins, but that the Ivanpah basin contains a much larger percentage of alluvial slopes than either of the other two basins, and less than half as large a percentage of lowland.

CLIMATE.

Most of the precipitation is in the winter. More than half of it falls during the four months December to March, inclusive. On the mountains much of the precipitation is in the form of snow. Occasional thunderstorms during the summer locally furnish considerable water, but they are so irregular in occurrence and are likely to be so severe that they are of relatively small value to growing crops. The following record of precipitation at Jean, in Ivanpah Valley, and at Pahrump, in Pahrump Valley, indicate the approximate monthly distribution of the precipitation in the valleys. The precipitation increases rapidly with increase of elevation.

The extremes in temperature are great. In the valleys there are usually frosts during November to March, and in the mountains temperatures near zero are common during these months. Snow does not lie on the mountains very long in the spring, however.

VEGETATION.

The higher mountains are sparsely clothed with junipers, which in some portions are sufficiently numerous to form wooded areas. (See Pl. VIII.) The higher part of Spring Mountain also supports yellow pine and piñon, which have been to a large extent cut for lumber for the neighboring mines. The lower parts of the mountains and the extensive alluvial slopes are covered chiefly by creosote bush (*Covillea tridentata*), several species of greasewood (*Sarcobatus*), rabbit brush or rayless golden rod (*Chrysothamnus graveolens*), cactus, and yucca. Sagebrush (*Artemisia tridentata*) was not observed by the writer in any of the basins, but it is found in the elevated valleys east and north of Government Holes, 10 miles southeast of Cima.

In the southwestern part of the Ivanpah basin the giant yucca or Joshua tree (*Yucca* or *Clistoyucca arborescens*) is abundant on the slopes north of Cima, with an undergrowth of creosote bush and greasewood. On the southeast side of the basin the yucca is less common, and it does not descend much below an elevation of 3,000 feet above sea level. In the northern part of the basin, on the slopes of State Line Pass and west of Borax and Jean, a smaller yucca, either a stunted form of the Joshua tree or a related form, is fairly plentiful. The slopes below 2,800 feet are dominated by creosote bush and greasewood down to the flatland bordering the dry lakes. The larger of the two "dry lakes" in Ivanpah Valley is bordered by a zone 200 to 400 yards wide that is occupied by greasewood almost to the exclusion of creosote bush. The smaller lake bed near Roach is bordered by a zone of rabbit brush and stunted greasewood, extending to the base of the alluvial slopes, where the creosote bush becomes dominant. The lake beds themselves are barren of vegetation and during most of the year have hard, level clay surfaces. During storms they may be covered by water to a depth of several inches.

Mesquite Lake is surrounded by a belt of mesquite trees in some places 100 yards or more in width. Sand ridges on the east side of the lake bed (Pl. X, *A*) are also in part covered by mesquite. The lake bed is largely crusted with alkaline deposits that are barren of vegetation, and a part of the east side consists of a barren clay flat, dotted with clay hummocks (Pl. X, *B*), some of which are more than 15 feet high, but in some portions of the lake bed there are sparse growths of salt grass and other alkali-resistant plants.

In the Pahrump basin mesquite grows along the east side of Stewart Valley, and there are groups of the mesquite trees near Sixmile, Mound, Stump, and other springs. On the lower slopes a yucca, smaller than the average Joshua tree but resembling it, is the most prominent plant, though scattered clumps of stunted greasewood and creosote bush form the principal growth. Along the upper borders of the alluvial slopes an occasional barrel cactus is found. The lake bed southwest of Mound Spring is a barren clay flat, but that of Stewart Valley is covered by salt grass.

ANIMAL LIFE.

Wild animals are not plentiful in this region. Occasionally a coyote or a jack rabbit may be seen, and during the evening or early morning a small variety of swift or fox is abroad, hunting for desert rats. These rats and the lizards are the most common forms of wild life. On the higher slopes, especially in the wooded portions of the mountains, a few birds may be found, but the region as a whole does not furnish much food for animal life. The smaller animals are by no means so common in this region as they are farther west, where in some of the recently homesteaded valleys they are so numerous that rabbit-tight fences are almost essential to the production of crops.

MINERAL RESOURCES.

Mining has been carried on in the mountains of the region for many years. Probably the first production came from the Potosi mine, near the north border of the Mesquite basin, where lead was obtained by the Mormons about 1860. Later ores of gold, silver, copper, and lead were discovered; and in 1906 a material that accompanies some of the lead ores and had been considered to be country rock was recognized by a mining engineer to be an ore of zinc.[1]

In 1914 platinum and palladium were recognized in a gold ore from the Boss mine (3 miles northeast of Ripley), which was an old property, originally developed for copper.[2] One result of the mining rush that followed was the establishment of the town of Platina.

[1] Hill, J. M., The Yellow Pine mining district, Clark County, Nev.: U. S. Geol. Survey Bull. 540, pp. 225–226, 1913.

[2] Knopf, Adolph, A gold-platinum-palladium lode in southern Nevada: U. S. Geol. Survey Bull. 620, pp. 1–2, 1916.

In 1916 ore from mines in the Mesquite basin was being hauled by auto trucks and by teams to Roach, for rail shipment to smelters, and ore from mines near Good Springs was being brought down by the narrow-gage railroad to the main line at Jean. The prevailing high prices of copper, lead, and zinc had caused the reopening of several properties that had been idle for some time.

In the New York Mountains, south of Ivanpah, tungsten minerals (wolframite and ferberite) were discovered in May, 1916, in old copper and gold-silver prospects. When the region was visited in August, 1916, many claims had been staked and several leases had been taken, but a recent drop in the price of tungsten had caused suspension of work. The prospects are on quartz ledges that cut the coarse gray granite country rock. In some places the quartz carries small amounts of blue and green copper carbonates and black manganese oxide. The Garvanza mill, erected about 1910 2 miles southeast of Brant, for the chlorination of the gold ore, was not successfully used, but small amounts of gold and copper ores from the mines were concentrated and shipped.

About 10 or 15 years ago salt was produced in Mesquite Lake by the evaporation, in iron pans heated by mesquite wood, of brine obtained from shallow pits, and the product was taken to San Bernardino and sold. In the pits at the old workings (locality 84, Pl. VIII) crusts of salt form. A sample collected by the writer in August, 1916, was analyzed in the United States Geological Survey laboratory by W. B. Hicks and reported to be nearly pure sodium chloride. It contains small amounts of sulphate, calcium, and magnesium and a trace of potassium.

About half a mile northwest of the old salt works the surface over several acres is strewn with large crystals of gypsum, which develop in the mud and seem to work their way up to the surface, where they disintegrate and cover the ground with shining flakes. It is said that a number of years ago about 1,200 acres on the west side of the dry lake was staked as placer gypsum claims, but in 1916 no assessment work appeared ever to have been done.

GEOLOGIC SKETCH.

STRUCTURE.

The dominant structural feature of the region is the Spring Mountain, a mass of irregular shape which has a general northwesterly trend and culminates in Charleston Peak, on the east side of the Pahrump basin. The range was studied by members of the Wheeler Survey[1] and in 1900–1901 by the late R. B. Howe, whose

[1] U. S. Geol. Surveys W. 100th Mer. Rept., vol. 3, pp. 124, 166, 179, 180, 1875.

notes were incorporated by Spurr[1] in a report on the region. These studies show that the mountains have been uplifted by extensive folding and faulting. Spurr[2] says that the range "shows more complex folding than any of the ranges north or east, and to this folding the irregular shape of the range is probably due. * * * In an east-west section the general structure of the range seems to be a broad syncline, with a number of minor folds of little importance. * * * In a north-south section the structure * * * appears to be anticlinal." Hill[3] visited the south end of the range in 1912 and found that "in this region the general structure seems to be monoclinal, but it is complicated by numerous faults and some folding. * * * The ridges extending westward into Mesquite Valley are faulted in a very complicated manner."

The Kingston and Nopah ranges, which together form the western border of the Pahrump and Mesquite basins, have steep fronts, especially on the west side of the Nopah Range. According to R. B. Rowe[4] the general structure of these ranges seems to be monoclinal, the dip being eastward, but there are many faults. At Kingston Peak the rocks are somewhat folded but have a general northward dip.

No detailed studies of the mountains bordering the southern part of the Ivanpah basin have been made. Clark and Ivanpah mountains on the west, and the New York Mountains and their northern extensions in the McCullough Range, on the south and southeast, are all believed to be greatly faulted, with minor folding, and to have a complex structure, much like that of Spring Mountain, to which both the eastern and western limiting mountains of Ivanpah basin are structurally related.

CLASSES OF ROCKS.

Granite and gneiss, presumably of Archean age, are found in the southwestern part of the New York Mountains. A belt of granite forms the central part of Clark Mountain,[5] and granite also forms the core of the mass that culminates in Kingston Peak.[4] The greater part of the mountains in the region, however, are composed of ancient sedimentary rocks. Quartzite, considered to be of Cambrian age, overlies the granite of Kingston Peak, and Cambrian lime-

[5] U. S. Geog. and Geol. Surveys W. 100th Mer. Rept., vol. 3, p. 32, 1875.

stones and other sedimentary rocks have been mapped by Spurr[1] as constituting the Nopah and adjacent ranges, the ranges near Clark Mountain, the McCullough Range, and the northern part of the New York Mountains. Spring Mountain and its offshoot, the Bird Spring Range, are composed chiefly of massive limestones and conglomerates of Carboniferous age.[2] Small areas of sandstone and shale of Triassic and Jurassic age are present north of Good Springs. No consolidated sedimentary materials of later age than the Jurassic have been recognized in the region, but there are a few small areas of lava, probably of Tertiary age, notably on Table Mountain, between Platina and Jean.

Each of the three valleys is underlain by deep deposits of alluvium. Great alluvial slopes extend from the bases of the mountains down to the lowlands. In their upper portions these slopes consist chiefly of angular gravel and cobbles, but in their lower portions the material is chiefly sand, silt, and clay. The greater part of the lowland in Pahrump Valley is underlain by calcareous sandy soil. In the northern part of Mesquite Valley numerous wells that were dug a few years ago show that the material is almost entirely silt and clay down to the ground-water level. In most of these wells only light-colored, nearly white calcareous clay and silt are exposed; but the northernmost well (No. 52, Pl. VIII) exposes about 50 feet of red-brown calcareous sandy silt, overlying the more common white material.

Along the east side of Pahrump Valley, from Pahrump to a point some distance south of Stump Spring, there are beds of light brown to cream-colored clay from only 2 or 3 feet thick to a maximum thickness, near Stump Spring, of about 50 feet. (See fig. 4.) The clay beds along the north side of the road between Manse and Pahrump contain layers and lenses of limestone gravel and in some places the clay is calcareous and cemented into a very hard material. A test well on the north side of the road halfway between Manse and Pahrump is said to have reached gravel underlying the clay at a depth of 41 feet. The western front of the beds form low but conspicuous bluffs at several places, notably at J. B. Yount's ranch (see Pl. X, *C*), suggesting a fault scarp. At no place were any of the clay beds observed to pass beneath the gravelly alluvium. Where the upper border was seen, east of Stump Spring and also east of Pahrump, the clay immediately overlies the alluvial wash, and its eastern limit is marked by a declivity several feet high. In the vicinity of Yount's ranch, where the formation covers the widest area, its surface rises with a uniform slope of about 100 feet to the mile north-

[1] Spurr, J. E., op. cit., pl. 1.

[2] Hill, J. M., The Yellow Pine mining district, Clark County, Nev.: U. S. Geol. Survey Bull. 540, pl. 4, 1914.

eastward to the lower border of the gravelly alluvial wash. In the southeast the clay extends up to an elevation of about 3,000 feet above sea level; but at its northwest end, near Pahrump, it is only 2,700 feet above sea level. These clay beds were presumably laid down in a lake or playa that formerly occupied that part of Pahrump Valley and were later elevated, probably with tilting and faulting.

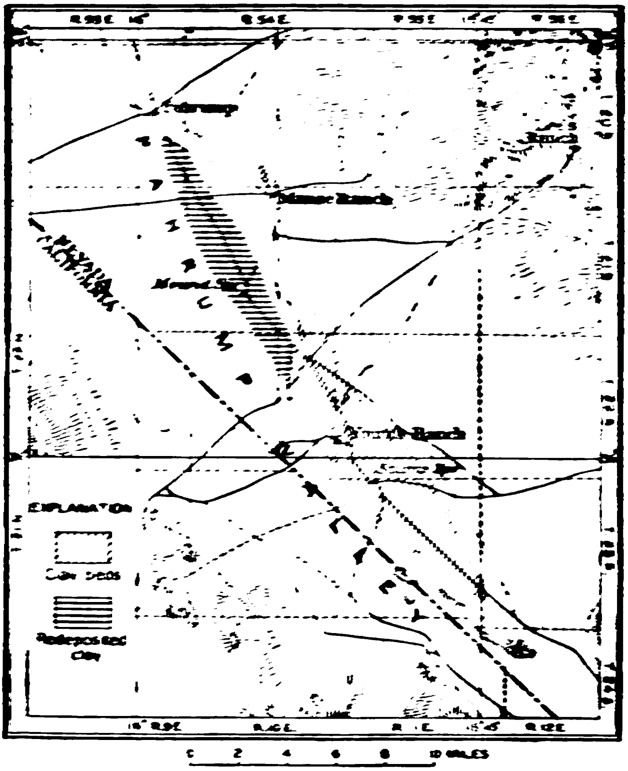

FIGURE 4.—Sketch map showing approximate extent of elevated clay beds in Pahrump Valley, Nev.

Between Mound Spring and Pahrump there is a belt of soft, fine-grained calcareous soil, standing 3 or 4 feet above the mean level of the valley floor, which seems to consist of clay redeposited by storm waters that have brought it from the main bed of clay to the east.

No evidence of clay beds appreciably above the levels of the playas and adjacent low slopes was observed in Mesquite and Ivanpah valleys. The drainage basins of these two valleys are smaller than that of Pahrump Valley, and they are surrounded in general by lower mountains, upon which less rain and snow fall, so that it is improbable that they formerly contained extensive lakes.

GROUND WATER.

PAHRUMP VALLEY.

SPRINGS.

Several large springs and many small ones are found in the mountains on the east side of Pahrump Valley and along the base of the mountains. A few large springs also occur farther down in the valley.

Lee's Spring and Trout Spring, up in the mountains, and Intermittent Spring and the Pahrump Valley springs, at the base of the mountains, yield large flows. The records of flow of these streams, as measured by the United States Geological Survey, are given in the following tables:

Spring issues in full volume in a bouldery wash. As ıe discharge record, although the flow is large in the , it lessens until the stream becomes nearly dry in the the summer. Pahrump Valley creek heads in a large 7), and another spring, which had a flow of about 0.6 n August, 1916, joins the creek a few hundred yards be- large springs, as well as the smaller ones, derive their ly from the precipitation on the slopes above them, and their flow decreases from a maximum in the spring ain and of melting snow to a minimum at the end of the

ıtem Spring (No. 2, Pl. VIII), near the north edge of the been estimated to yield 200 barrels a day. Its water has l down to the mining camp of Johnnie for domestic use.

Spring (No. 49) is in a gully in the clay beds along the east ıe valley and apparently derives its water by seepage from ls or from the gravel immediately underlying them. Its low has been estimated at 20 barrels a day.

springs are found at the Pahrump and Manse ranches, and er at each place has been used for many years for irrigation. ıse there are two springs 75 yards apart. The temperature of ter in each is 75° F. The flow of the smaller spring is about ond-foot and the combined flow of the two springs, measured nber 30, 1916, by Albert Quill, of the United States Geological ey, was 3.23 second-feet.

the Pahrump ranch there is a group of two large springs and smaller one that are similar to those at Manse. The water rises cipally in a pool 20 or 30 feet in diameter and 3 or 4 feet deep lered by banks of partly cemented gravel a few feet high. The dy bottom of the pool is kept in ebullition by the rising water, ich has a temperature of 76½° F. The flow of the two larger rings, as measured by Albert Quill September 30, 1916, was 2.53 d 2.20 second-feet.

On J. M. Raycraft's ranch, half a mile northwest of Pahrump, ıere is a spring (near well location No. 12), which is probably simi- ar in character to the large ones at Pahrump and Manse. It rises n a small marshy area and flows about 10 gallons a minute. A few hundred yards southeast of this spring there is a mass of calcareous tufa, apparently a spring deposit, forming a low mound 10 or 15 yards in diameter.

Mound Spring, 4 miles south of Manse, formerly had a small flow. It is at the base of a low mound composed of clay and fine sand. This mound was probably built, like many similar ones at desert springs, by the moistening and retention of material blown by the

Discharge measurements of Trout Creek about 5 miles below Trout Spring, or 16 miles east of Pahrump, Nev.

Intermittent Spring issues in full volume in a bouldery wash. As is shown by the discharge record, although the flow is large in the spring months, it lessens until the stream becomes nearly dry in the later part of the summer. Pahrump Valley creek heads in a large spring (No. 37), and another spring, which had a flow of about 0.6 second-foot in August, 1916, joins the creek a few hundred yards below. These large springs, as well as the smaller ones, derive their water directly from the precipitation on the slopes above them, and consequently their flow decreases from a maximum in the spring months of rain and of melting snow to a minimum at the end of the dry season.

Horseshutem Spring (No. 2, Pl. VIII), near the north edge of the basin, has been estimated to yield 200 barrels a day. Its water has been piped down to the mining camp of Johnnie for domestic use.

Stump Spring (No. 49) is in a gully in the clay beds along the east side of the valley and apparently derives its water by seepage from these beds or from the gravel immediately underlying them. Its normal flow has been estimated at 20 barrels a day.

Large springs are found at the Pahrump and Manse ranches, and the water at each place has been used for many years for irrigation. At Manse there are two springs 75 yards apart. The temperature of the water in each is 75° F. The flow of the smaller spring is about 0.8 second-foot and the combined flow of the two springs, measured September 30, 1916, by Albert Quill, of the United States Geological Survey, was 3.23 second-feet.

At the Pahrump ranch there is a group of two large springs and one smaller one that are similar to those at Manse. The water rises principally in a pool 20 or 30 feet in diameter and 3 or 4 feet deep bordered by banks of partly cemented gravel a few feet high. The sandy bottom of the pool is kept in ebullition by the rising water, which has a temperature of 76½° F. The flow of the two larger springs, as measured by Albert Quill September 30, 1916, was 2.53 and 2.20 second-feet.

On J. M. Raycraft's ranch, half a mile northwest of Pahrump, there is a spring (near well location No. 12), which is probably similar in character to the large ones at Pahrump and Manse. It rises in a small marshy area and flows about 10 gallons a minute. A few hundred yards southeast of this spring there is a mass of calcareous tufa, apparently a spring deposit, forming a low mound 10 or 15 yards in diameter.

Mound Spring, 4 miles south of Manse, formerly had a small flow. It is at the base of a low mound composed of clay and fine sand. This mound was probably built, like many similar ones at desert springs, by the moistening and retention of material blown by the wind to the spring. The small spring at Mr. Raycraft's ranch i at the base of a similar mound, and it is reported that there are small springs at other mounds near by.

The springs along the border of the lowland seem to be sup by water which rises from a considerable depth under artesian produced in the extensive alluvial deposits to the east or pos from deeper sources. The general character of the alluvial slop the positions of the Manse and Pahrump ranches with respe them are shown in Plate IX, *A*, a view looking northward alon east side of the valley. Evidence that the water comes from a source is furnished by the temperature of the springs—75° Manse and $76\frac{1}{2}$° F. at Pahrump, as compared with that of Inte tent Spring—57° F. The uniform flow of the Pahrump and M springs, contrasted with the varying flow of Intermittent Spring the other mountain springs, also indicates that the mountain sp and the valley springs are supplied in different ways.

ARTESIAN WATER.

Besides the springs in Pahrump Valley that seem to give evid of artesian conditions, there are several wells that yield arte flows. (See table below.) Three wells on the Pahrump ranch h been drilled 200 or 300 yards apart, and the easternmost is 225 ya west of the main spring at this ranch. The records of these wells, p sented through the courtesy of Mr. T. G. Darrough, manager of ranch, are shown graphically in the left-hand portion of Plate The artesian flows seem to have been obtained at several horiz below a depth of 200 feet, from layers of sand or gravel beneath re tively impervious beds of clay or cement gravel. The wells have t following flows, according to measurements with current meter ma September 30, 1916, by Albert Quill, of the United States Geologic Survey:

Flows of artesian wells on Pahrump ranch.

Well No.	Flow.		Temperature (°F.).
	Second-feet.	Gallons per minute.	
1	1.25	560	$78\frac{1}{2}$
2	.64	287	75
3	.62	278	74

J. M. Raycraft has three flowing wells, each 10 inches in diameter and about 175 feet deep, at his home (locality No. 12, Pl. VIII) on a low mound of wind-blown sand half a mile northwest of Pahrump. The wells flow about 35, 35, and 260 gallons a minute

(according to measurements by the writer), and the water from each well has a temperature of 79° F. A quarter of a mile to the southeast a fourth well (No. 13) encountered flowing water at a depth of 285 feet; the discharge as measured by the writer was about 65 gallons a minute and the temperature 79° F. The following partial record of materials encountered in drilling this well was kindly furnished by Mr. Raycraft:

Record of J. M. Raycraft well (No. 13), Pahrump, Nev.

	Thickness.	Depth.
	Feet.	*Feet.*
Unrecorded	82	82
Hard limestone	3	85
Clay	5	90
Coarse cement gravel	3	93
Clay	43	136
Cement gravel	3	139
Unrecorded	147	286
Hard blue limestone (bedrock)	36	322

A fifth flowing well (No. 16), belonging to Mr. Raycraft, is said to have a somewhat larger flow than well No. 13.

F. A. Buol has also obtained flows near his house (at well locality No. 11) in five wells reported to be 150 to 520 feet deep, but detailed information concerning these wells was not obtained.

In the vicinity of Mound Spring several test wells were drilled during 1914–1916 by the Oasis Land Co. Water under artesian pressure was encountered in all of them, and in two (Nos. 32 and 33) small flows were obtained. Well No. 32 was sunk to a depth of 135 feet a few yards from Mound Spring, and in August, 1916, the water rose 15 feet above the surface. In well No. 33 flows were struck at depths of about 200 and 390 feet but were lost in gravel at 535 feet. After the well was filled to about 475 feet below the surface a slight flow was again developed. In August, 1916, the flow was about 1 gallon a minute, with a temperature of 72° F. It is said that in the Spanker wells (Nos. 40 and 41), 3 miles southwest of Mound Spring, water from the lower strata did not rise higher than 65 feet below the surface, and that the first water, struck at 23 feet, flowed down the well to the 65-foot level. J. B. Yount has sunk a well (No. 44) on his ranch, 7 miles southeast of Mound Spring, to a depth of 320 feet. A flow was not obtained, but at 225 feet water was struck in fine sand beneath clay under pressure that caused it to rise within 6 feet of the surface.

The great alluvial slopes that extend east and southeast of Yount's ranch probably contain water under considerable artesian head, and the lower portions of these slopes offer favorable conditions for obtaining artesian flow. It is possible that flows can also be developed in the lower part of Pahrump Valley, but the fact that the artesian springs and the artesian wells drilled up to August, 1916, are all more than [illegible] feet above sea level suggests that the artesian water may be shut off from the strata beneath the lower lands by the fine and relatively impervious sediments deposited in the lowest part of the valley.

WATER TABLE.

In Stewart Valley, which forms the lowest part of the Pahrump drainage basin, water is present at less than 10 feet beneath the surface and has caused the growth of salt grass. The water table around its borders fluctuates somewhat with the season and is highest in the spring, when the valley receives some surface water. The seasonal change is sufficient so that shallow wells at localities 8 and 9 (Pl. VIII), which have at times served as watering places, were dry in August, 1916. At the south end of the valley, in well No. 25, dug close to the drainage channel leading to the central depression, the water stood [illegible] feet below the surface. Farther up the same drainage course water stood about 6 feet below the surface at Sixmile Spring in a pit in a low sandy mound. In the flowing wells drilled at and near Pahrump water was struck at [illegible] to 30 feet below the surface. In well No. [illegible], about 4 miles south of Pahrump, water was struck at [illegible] feet, and in wells Nos. [illegible], 40, and 41, 4 to 6 miles farther south, at [illegible] feet. In several wells near Mound Spring water was struck at [illegible] to [illegible] feet. The water, therefore, seems to be within 40 feet of the surface throughout a large part of Pahrump Valley. The quantity of ground water recoverable from shallow wells appears to be rather small, however, as the water is obtained in fine sand and silt that do not readily furnish a pumping supply.

A well dug about 5 miles southeast of Mound Spring is said to have struck water at a depth of 97 feet. No other information concerning the depth to water beneath the higher slopes was obtained. The reported depth in this single well, however, indicates that on the east side of the valley the water table slopes upward at a gradient that makes the increase in depth to water about 25 feet with each 100 feet of rise in the elevation of the surface.

The data obtained in regard to wells in this valley are tabulated on pages 76–79.

QUALITY OF WATER.

Samples of water for analysis were collected in the Pahrump basin from two springs (Nos. 22, 29, Pl. VIII), one flowing well (No. 15, 254-foot well on Pahrump ranch), and two shallow wells (Nos. 25, 45). (See table, p. 80.) The waters are on the whole better than those from the Mesquite or Ivanpah basins, the highest total solids being only 387 parts per million. The waters from the two springs are the best. Although the conditions governing the occurrence of these two springs are apparently different, the waters are of approximately the same mineralization, differing in total solids by only 17 parts per million, and both are of the same character. No. 22 contains only 4.3 parts per million of sodium and potassium, and No. 29 contains only a trace of these elements. The samples from wells Nos. 15 and 45 are similar to the spring waters in that they are calcium-carbonate in character, but they contain somewhat more mineral matter. The most highly mineralized water analyzed from the Pahrump basin (from the Buchanan well, No. 25) contains 537 parts per million of total solids and is of the sodium-carbonate type. The greater mineralization and high sodium content of this water are probably due to the location of the well, which is in almost the lowest part of the basin, close to a channel that carries the drainage from a playa south of Sixmile Spring into the lowest part of Stewart Valley.

All the waters are of fair quality for domestic use. They can be used without difficulty for cooking and drinking but are somewhat unsatisfactory for washing on account of their rather high hardness. All the waters except that from the Buchanan well (No. 25) are classed as fair for boiler use, although the scale-forming constituents are in excess of the amounts ordinarily considered to be allowable in a fair water, according to the rating in the table on page 80. Such a classification was made because the amounts of foaming constituents are so far within the limits for a good water. The waters could be improved by proper chemical treatment for the reduction of the scale-forming constituents. The water from the Buchanan well is of poor quality for boiler use because, in addition to the large amount of scale-forming constituents, the foaming ingredients are also high. All the waters except that from the Buchanan well are good for irrigation, and even that water can be used with good results if proper care is observed. This well is used very seldom, and it is possible that the quality of the water might be improved by regular pumping.

From the analyses it seems probable that waters fair for domestic and boiler use and good for irrigation can be obtained throughout most of Pahrump Valley. In the lowest parts of the valley, especially near the playas, there may be some highly mineralized waters.

IRRIGATION.

Within recent years farming has been attempted in each of the three valleys under consideration, but success has been obtained only where irrigation is practiced. Experiments have fully demonstrated that the rainfall is too slight and uncertain and the dry periods are too long and hot to allow the successful growing of crops by dry farming.

In Pahrump Valley farming has been carried on for many years at the Manse and Pahrump ranches by irrigation from the large springs at these places. In [illegible] about [illegible] acres on the Manse ranch was under cultivation, [illegible] acres in alfalfa, [illegible] acres in vineyard and mixed orchard, and most of the remainder in grain. On the Pahrump ranch by means of the spring water and that from three flowing wells about [illegible] acres of orchard, [illegible] acres of alfalfa, and 125 acres of barley were irrigated, and in [illegible] a considerable acreage of new land was being cleared and leveled preparatory to planting to alfalfa. Northwest of the Pahrump ranch J. M. Raycraft and F. A. Buol had under cultivation lands that were irrigated by flowing wells. At Lee's ranch in Trout Canyon a few acres of alfalfa and vegetables were irrigated by the mountain stream, and at Yount's ranch a garden was supplied with water by windmills pumping from shallow wells. An attempt at farming in Stewart Valley had failed, probably because of the alkalinity of the soil as much as because of the lack of an irrigation supply. The Oasis Land Co. was preparing to develop a Carey Act project including several thousand acres in the neighborhood of Mound Spring by irrigation water from Lee's Spring and Intermittent Spring, augmented by wells. The lands in the lowest part of the valley, from the "dry lake" west of Yount's ranch to Stewart Valley, are too poorly drained and too liable to become alkaline to be suitable for farming. The lower slopes along the east side of the valley, however, are probably capable of successful cultivation at those places where ground water can be developed for irrigation either in flowing wells or in wells with low pumping lift. The ground water obtained in the valley is generally of suitable quality for agriculture except in the lowest parts, near the "dry lakes."

MESQUITE VALLEY.

SPRINGS.

The only springs reported in the Mesquite drainage basin are Keystone Spring, near the northeast border, and a spring near the Potosi mine, in the north corner of the basin. Neither was visited by the writer, but J. E. Blackburn, who mapped the region in [illegible], estimated their flow as, respectively, about 15 and 40 barrels a day. The spring near the Potosi mine has since been developed, so that in [illegible] it supplied considerable water for the mining settlement.

WATER TABLE.

The depth to water in the central part of Mesquite Valley was tested in 1910–1914 by a number of wells drilled or dug by entrymen on desert and homestead claims. The locations of the wells that were observed are shown on Plate VIII, and data as to their depth and the depth to water in them are tabulated on pages 76–79. In August, 1916, the depth to water in these wells ranged from 4 feet in pits in Mesquite Lake to 52 feet in Bullock's well, at the southeast border of the lowland; 52 feet at Sandy, in the northeast; and 67 feet in well No. 54, in the northwest. Well No. 51, drilled prior to 1910 in the northern part of the valley to furnish a water supply near the old traction road, extending from the borax deposits near Death Valley to the railroad, was dry at a total depth of 82 feet; but it is said to have formerly contained water at a depth of about 90 feet. The water table beneath the central and northern parts of the valley, along its axis, therefore seems to be fairly flat, as shown in figure 5, with a slope of only 5 or 6 feet to the mile. From northeast to southwest, across the valley, the slope of the

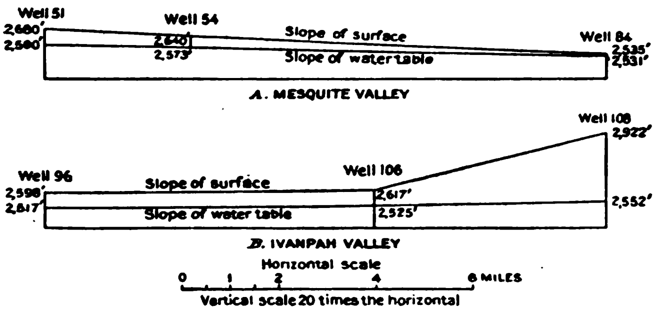

FIGURE 5.—Diagram showing slopes of surface and of water table in Mesquite and Ivanpah valleys, Calif. The Mesquite Valley section extends from northwest to southeast between wells 51 and 84 of Plate VIII; the Ivanpah Valley section extends from north-northwest to south-southeast between wells 96 and 108.

water table is somewhat greater, the available records of surface elevation and of depth to water indicating a rise of the water table toward the northwest of 10 or 12 feet to the mile.

QUALITY OF WATER.

Samples of water from six wells in Mesquite Valley (Nos. 58, 64, 72, 74, 76, and 86, Pl. VIII) were analyzed. (See table opposite p. 80.) All these waters are or have been used for domestic supply, although three of them contain more than 600 parts per million of solids in solution and have a distinctly mineralized taste. Only two of the six waters are better than the most highly mineralized water in the Pahrump basin. The character of the water apparently varies much more from place to place in Mesquite Valley than in Pahrump Valley.

The water from well No. 58, which is the least mineralized of those sampled in Mesquite Valley, is magnesium-carbonate in character. The waters from the Cryor well (No. 76) and the old Sandy

Mill well (No. 74) are like that from No. 58, in that they are carbonate waters, but in them calcium predominates over the magnesium. The Sandy Mill water, however, is more highly mineralized than the other two. These three waters are all classed as good for irrigation. They are so hard that they may be unsatisfactory for cooking and washing, but for drinking and other ordinary household purposes they are probably quite satisfactory. The waters from wells Nos. 58 and 76 are classed as only fair for boiler use because of the amount of scale-forming constituents present, and No. 74 is classed as poor because of its higher content of scale-forming constituents.

The water from the W. A. Tritt well (No. 64) is magnesium-sulphate in character. It is poor for domestic use because of its excessive hardness and bad for boiler use because of its tendency to corrode boilers—a condition, however, which could be corrected by the addition of the calculated amount of lime water. It is satisfactory for irrigation, although it contains more sodium than the waters previously described.

At locality No. 72 there were in 1916 two shallow dug wells a few yards apart, each of which was surmounted by a windmill that pumped to a cattle trough. One of these wells or a similar one was formerly known as Cub Lee Spring. The analysis shows that the water is sodium-carbonate in character. It is classed as fair for domestic use and irrigation but is bad for boiler use because of the large amount of scale-forming and foaming constituents. This water contains a greater amount of chloride than any of the waters described above. The water is probably contaminated to some extent by seepage from the mud trampled by cattle around the troughs, and the chloride content may for this reason be higher than is normal in ground water of this vicinity. An even higher chloride content, however, is found in Bullock's well (No. 86), sometimes known as Knight's well. This well was dug a number of years ago at the base of the desert wash slopes, at the southeast edge of the lowland. It has long furnished water for mines in the mountains to the northeast and for teams and autotrucks hauling ore to the railroad at Roach. The water is distinctly salty in taste, and the analysis shows that of its total content of 1,445 parts of mineral matter, 551 parts, or more than one-third, consists of the chloride radicle. The principal basic radicle is sodium. Although the water is of poor quality it is freely used for drinking and cooking because of the lack of a better supply. It is very bad for boiler use because of the high amount of foaming constituents. It is also poor for irrigation.

The two wells which have the highest chloride content are in the south end of the valley, not far from the salt-incrusted playa known as Mesquite Lake, suggesting that the ground water has become concentrated in this part of the valley by continual evaporation. On the other hand, the least mineralized waters in the basin, according to the analyses, are at the north end and on the sides of the valley some distance from Mesquite Lake.

IRRIGATION.

In 1910 to 1914 numerous homestead and desert entries were filed on land in the northern part of Mesquite Valley, and a number of wells were drilled and pumping plants established. Attempts to irrigate on an extensive scale proved unsuccessful, however, owing largely to the poor quality of the soil. In 1916 there were only two small irrigated tracts in the valley, those of W. A. Tritt and J. B. Cryor. At the Tritt ranch (locality No. 64, Pl. VIII) water was pumped from a dug well by a windmill and used to irrigate a small garden with indifferent success. As is shown by the analysis (opposite p. 80), the water is of good quality for irrigation. Any failure to produce crops was therefore due to the nature of the soil or other causes, rather than to the water. On the Cryor ranch, at Ripley, a few acres of alfalfa and garden were supplied by windmill, and the crops made a good growth under careful irrigation. The water here also is of good quality, as shown by the analysis of well No. 76. It is probable that other areas could be successfully irrigated along the eastern sandy slopes of the valley. The greater part of the shallow-water area in Mesquite Valley, however, is probably too alkaline or too clayey to permit its successful cultivation.

IVANPAH VALLEY.

WELLS, SPRINGS, AND INFILTRATION TUNNELS.

In the mountains that border the Ivanpah Valley there are a number of small but perennial springs that furnish reliable water supplies to prospectors and others. About 20 of these springs are shown on Plate VIII, and data furnished by S. G. Lunde, topographer, of the United States Geological Survey, concerning their yields, have been inserted in the records on pages 76–79. None of these springs yield much water, and some of them have no appreciable overflow during the dry months. Mescal Spring (No. 94) is said, however, to have furnished water for a small stamp mill at the Mollusk mine.

A small spring (No. 114) in the bed of a canyon has furnished water for prospectors in its immediate vicinity, and in 1916 water was also piped from it to the home of P. S. Banfield, three-quarters of a mile east of Brant, for domestic supply.

"Cut Spring" and "White Rock Spring" (Nos. 111 and 112) are small infiltration tunnels driven into the mountain side, and the seeping water collects in pools, from which it is hauled to Cima for domestic supply. At Kessler Spring (No. 113) water has been developed by a pit excavated about 10 feet deep in a dry wash and curbed and roofed with boards. From the bottom of the pit a pipe extends down the wash for several rods, so that a gravity flow is obtained at cattle troughs and at a faucet for domestic and travelers' supplies. Water supplies have been obtained at other places in washes at high levels in shallow wells like that of Kessler Spring, but so far as was learned gravity flows have not been developed elsewhere in this region by piping. The Mexican well (No. 93) is reported to be only 5 feet deep and usually to contain about 3 feet of water. When visited by D. G. Thompson late in 1917 it was tightly covered and equipped with a force pump. Water was hauled from the well to the Mohawk mining camp, 4½ miles west of the well, and was also used in considerable quantities by teams hauling ore from this camp to Roach. The supply is apparently very good. Water has been developed by somewhat deeper wells dug in the gravelly wash at Crescent (No. 104). The mining camp of Good Springs (No. 63) received its name from springs that formerly flowed in considerable volume, but it is said that of late years water is obtained chiefly from wells about 30 feet deep, dug in the gravel wash.

At Borax siding, 4 miles south of Jean, a well (No. 87, Pl. VIII) was drilled in 1905 by the Los Angeles & Salt Lake Railroad Co. to a depth of 687 feet. The record, kindly furnished by the company and reproduced graphically in Plate XI (p. 64), shows that only relatively coarse, unconsolidated materials were encountered. Water stood in the well 199 feet below the surface in 1905. The pumping station was dismantled in 1914, as the pumping station near Ivanpah served the railroad needs.

At Roach a test well, drilled by George Morgan, struck water at 91 feet. The water is said to be of fair quality, but the settlement is supplied with water brought by train from Las Vegas, as is also the town of Jean.

An abandoned dug well (No. 89) 2½ miles southwest of Roach and the Francis well (No. 102), dug more than 20 years ago on the west side of Ivanpah Valley, near the traction road, both contained water in August, 1916, at a depth of 90 feet below the surface.

The Yates well (No. 96) and the Murphy well (No. 106) were dug a number of years ago for cattle watering places. They are situated, respectively, at the west edge of Ivanpah Lake and at the south edge of the flat land bordering the "dry lake." They were abandoned some time prior to 1916, but the Murphy well was again used in 1917 for watering cattle. In August, 1916, the Yates well contained water at 81 feet and the Murphy well at 92 feet. Several wells drilled in 1914–1916 between the Murphy and Yates wells encountered water at practically the same level as in these wells. On the extensive alluvial slope in the southern part of the Ivanpah basin a well of the Los Angeles & Salt Lake Railroad supplies water to a reservoir near Ivanpah, for locomotive use. The reported depth to water in this well—370 feet—indicates that the water table beneath the valley is unusually flat, as is illustrated in figure 5 (p. 69). The rise of the water table southward from the Murphy well to the railroad well is only 5 feet to the mile, whereas the rise in elevation of the surface is 61 feet to the mile. From east to west across the valley the water table also seems to be nearly horizontal; for at Lyon station, 2,800 feet above sea level, the depth to water is reported to be 275 feet, the elevation of the water table therefore being 2,525 feet, or only 8 feet above the elevation of the water surface in the Yates well. The flatness of the water table indicates that the desert wash is fairly coarse and permeable throughout, so that water does not collect in porous sands and gravels between layers of relatively impermeable clay. In the wells that have been drilled, it is reported, water was encountered under little or no artesian pressure.

In many of the basins of the Southwest that have no outlets for surface water the supply of ground water received from precipitation is about balanced by losses through springs and evaporation from lakes or from the soil where the water is close to the surface. This condition is present in Pahrump and Mesquite valleys, where moist lands are found respectively in Stewart Valley and in Mesquite Lake. Beneath the lowest portions of Ivanpah Valley, however, the depth to water is about 80 feet, and it seems impossible that evaporation keeps the water table down to so great a depth below the surface. The water table from east to west across the valley is shown by the depth to water in wells Nos. 96 and 97 to be nearly horizontal. Toward the south the water table (see fig. 5) slopes gently upward. The elevation above sea level of the water table in Ivanpah Valley is about 2,515 feet and in Mesquite Lake about 2,531 feet, so that there would seem to be no underground escape northward. It is possible that leakage sufficient to balance the relatively small annual ground-water intake and keep the water table down to about 80 feet below the surface takes place along fault fractures extending northeastward toward Las Vegas Valley.

QUALITY OF WATER.

Samples of water from two springs (Nos. 111 and 113, Pl. VIII) and six wells (Nos. 89, 93, 96, 103, 106, and 108) in the Ivanpah basin were analyzed. (See table opposite p. 80.) One analysis furnished by the Los Angeles & Salt Lake Railroad (well No. 97) has been included in the table. The analyses show great extremes in the degree of mineralization of the waters in the valley, one sample (No. 108), which is the best water analyzed from the three valleys described in this report, having only 240 parts per million of total dissolved solids. Another water (No. 89) contains more than 100 times as much. Four of the nine waters are of good or fair quality for domestic, boiler, and irrigation use.

The waters from three wells in the southern part of the basin (Nos. 103, 106, and 108) are relatively low in total solids. Of these the water from the railroad well (No. 108) on the alluvial slope some distance above Ivanpah Lake contains only 240 parts per million, and the waters from the other two wells, which are much nearer the clay flat, are higher in total solids, containing 372 and 335 parts. The water from the railroad well is a sodium-sulphate water and the other two are sodium-carbonate waters. All three waters are classed as good for domestic use. The water from the railroad well, which is regularly used for locomotives, is classed as good for boilers. The other two are classed as only fair for boiler use on account of their content of foaming constituents. The water from the Murphy well (No. 106) will also form considerable scale. The waters from the railroad and Murphy wells are good for irrigation, but that from well No. 103 is only fair.

According to analyses of samples from wells Nos. 89 and 96, the water farther north, in the lowest part of the valley, is much poorer; in fact, it is practically unfit for any use. These wells are dug only a few feet below the ground-water level. It is said that they furnished water of fair quality when they were used regularly. They had been abandoned for some time prior to August, 1916, and at that time contained waters that were practically brines, one (No. 96) containing 7,702 parts per million of total solids and the other (No. 89) containing the unusually high amount of 27,501 parts per million. Both waters taste salty. It is said that in digging the Yates well (No. 96) salty water was first struck, but better water was obtained a few feet deeper. It is probable that in each well the water has become concentrated on standing unused. Both waters are sodium-chloride in character, and both are unfit for domestic, boiler, or irrigation use. A water from a well drilled by the Los Angeles & Salt Lake Railroad Co. at Lyons (Desert station) (No. 97), almost due east of Yates, according to an analysis furnished by the railroad company, is of much better quality, containing only 433 parts per million of total solids. It is sodium-chloride in character. This well is some distance up the alluvial slope away from the clay flat. The water is classed as good for domestic purposes, bad for boiler use, and fair for irrigation.

The remaining sources from which samples were analyzed, Nos. 93, 111, and 113, are all in the mountainous parts of the Ivanpah basin. Each of the three waters is a carbonate water. Two of them, from Cut Spring (No. 111) and Kessler Spring (No. 113), are calcium-carbonate waters. They are both classed as only fair for domestic use because of their hardness; they will probably require a considerable amount of soap in washing, but are good for drinking and other household purposes. The water from Cut Spring is hauled to Cima for domestic use. The waters from both Cut Spring and Kessler Spring are good for irrigation.

The water from Mexican well (No. 93) is sodium-carbonate in character and is considerably higher in total solids than the other two. It is good for irrigation but poor for boiler use because of its large amount of scale-forming and foaming constituents and poor for washing because of its high hardness. This water is used considerably by travelers, and despite its hardness it can probably be used for drinking and other ordinary household uses without any bad effects.

Although analysis shows two waters from the Ivanpah basin to be very highly mineralized, it is believed that throughout the greater part of the region water of good or fair quality for both domestic purposes and irrigation is available. The two saline waters were obtained from wells in the lowest part of the basin, at the edge of the playa. The high mineralization of these waters may be due to concentrated surface waters running into the wells or to salt derived from the clay of the playa. The water from wells on the alluvial slopes, some distance from the clay flat, is generally of good quality.

IRRIGATION.

During the three years prior to 1916 several wells were drilled in the lowlands south of Ivanpah Lake and a few attempts at irrigation were made, but these attempts proved unsuccessful on account of the clayey character of the soil. On the higher land, near Cima and Brant, gardens have been grown with water from springs, but the available supply from such sources is insignificant. Farming other than the cultivation of small gardens probably can not be successfully carried on in any part of Ivanpah Valley because of the lack of available water. Irrigation by means of wells is not feasible, because of the excessive pumping lift involved, and because water is not found in great enough quantity. In January, 1918, it was stated that the Murphy well (No. 106) could be pumped dry in about four hours at a rate of about 20 gallons a minute. This amount of water was derived from a 12-foot tunnel at the bottom of the well, which is in adobe. The water does not filter in rapidly enough to meet the ordinary requirements of irrigation. The soil in the lowest part of the valley, where the pumping lift is the least, is too clayey and too alkaline for successful cultivation. There is no stream water available, and apparently no suitable locations for storage reservoirs nor sufficient flood water to be of value if it could be stored.

In the later part of 1917 and the early part of 1918 no one was attempting farming in the Ivanpah Valley, and the valley had been practically abandoned as an agricultural project. The Rock Springs Cattle Co. had improved the Murphy well (No. 106) and was using it to water about 200 head of cattle. The number of cattle that may be kept in the valley is largely limited by the available supply of wild grass, as the conditions of water supply and soil will not permit the cultivation of grazing crops.

RECORDS OF WELLS AND SPRINGS.

Most of the wells and springs listed in the following pages have been mentioned in the text. The available data concerning all those whose locations are shown on Plate VIII are here brought together in tabular form for easy reference in connection with the map.

Records of wells and springs in Pahrump, Mesquite, and Ivanpah valleys, Nev.-Calif.

QUALITY OF WATER.

CLASSIFICATION.

Samples of water from 12 wells and 3 springs in the three basins under consideration were collected by the writer and analyzed under contract by S. C. Dinsmore, Reno, Nev. Four additional samples, three from wells and one from a spring, were collected by David G. Thompson in the fall of 1917 and were analyzed in the laboratory of the water-resources branch of the United States Geological Survey. One analysis of water from a well owned by the Los Angeles & Salt Lake Railroad Co. was furnished by that company. The results of the analyses, together with a classification of the waters for domestic, boiler, and irrigation use, are given in the table opposite page 80.

The classification[1] of waters for domestic use, as given in the table, is based on the determinations of the dissolved mineral constituents and their chemical character. The suitability of a water for domestic use depends on its acceptability for drinking, washing,

[1] Mendenhall, W. C., Dole, R. B., and Stabler, Herman, Ground water in San Joaquin Valley, Calif.: U. S. Geol. Survey Water-Supply Paper 398, pp. 73–82, 1916.

and cooking, as determined chiefly by the amounts of iron, nitrate, and chloride in solution and by the hardness of the water. Waters high in hardening constituents can be used for drinking, but they are unsatisfactory for cooking and laundering. Hardness exceeding 1,500 parts per million makes water unfit for cooking. The hardness sufficient to cause prohibitive soap consumption in washing is much less than that which makes water undesirable for cooking.

The presence of approximately 200 parts per million of carbonate, 250 parts of chloride, or 300 parts of sulphate may give the water a slight taste. Waters containing considerably more of these constituents can be tolerated by human beings, but those which contain more than 300 parts per million of carbonate, 1,500 parts of chloride, or 2,000 parts of sulphate are intolerable to most people. Local conditions and individual preference, however, largely determine the significance of the terms "good" or "bad," as applied to the mineral quality of water for domestic use. For instance, in a desert region a water containing 240 parts per million of hardness might be classed as fair; in a region where the supply is abundant and the quality is in general much better, as in the New England States, the same water would be classed as bad by most users. It should be borne in mind in this report that the classification of a water for domestic use is based only on its mineral content, and although certain determinations afford indications of the sanitary quality of the water they may not permit a complete sanitary interpretation. A water may contain only small amounts of dissolved solids and yet be so badly polluted as to be unsafe for drinking.

With respect to their quality for use in boilers, waters are first classified according to their scale-forming and foaming constituents and the probability of corrosion, and from these data the advisability of their use is determined. Scale is formed in boilers by certain substances that go out of solution on heating and concentration of the water. Foaming, or the formation of masses of bubbles in the boiler, is caused by certain salts or by fine mud or other matter in the water. The corrosion or pitting of the walls and tubes of boilers is caused by electrolytic action, which may be accelerated or retarded by the presence of various substances in solution.

Rating of waters for boiler use according to proportions of incrusting and corroding constituents and according to foaming constituents.

Incrusting and corroding (scale-forming) constituents.		Foaming constituents.

With respect to their value for irrigation, waters are classified according to their content of salts toxic to vegetation. Water containing considerable quantities of sodium salts or other alkali salts[1] is injurious to vegetation, because, through evaporation, the alkali collects in the few inches of top soil in such quantities as to interfere greatly with the growth of plants. The irrigating value of a water with respect to the amount of contained alkali is expressed by the term "alkali coefficient,"[2] which is defined as the depth of water in inches which on evaporation would yield sufficient alkali to render the soil to a depth of 4 feet injurious to the most sensitive crops. The coefficient affords a purely arbitrary means of comparing waters used for irrigation. It does not take account of certain important factors, such as the methods of irrigation and of drainage, the character of the soil, and the kind of crop, but it indicates very well the general suitability of the water for irrigation. The waters in the areas here discussed have been classified as to quality for irrigation in accordance with the following rating, which is based on ordinary irrigation practice in the United States and which indicates in a very general way the customary limitation in the use of waters having various alkali coefficients.

Classification of water for irrigation.[a]

Alkali coefficient (inches).	Class.	Remarks.
More than 18	Good	Have been used successfully for many years without special care to prevent alkali accumulation.
18 to 6.0	Fair	Special care to prevent gradual alkali accumulation has generally been found necessary except on loose soils with free drainage.
5.9 to 1.2	Poor	Care in selection of soils has been found to be imperative, and artificial drainage has frequently been found necessary.
Less than 1.2	Bad	Practically valueless for irrigation.

ANALYSES.

The waters analyzed from the Pahrump, Mesquite, and Ivanpah basins vary in mineral content from moderate to very high. The lowest amount of total solids is 240 parts per million, from well No. 108, and the highest is 27,501, from well No. 89. Both of these waters come from the Ivanpah basin. The waters analyzed are mostly good or fair for irrigation, cooking, and drinking, but average somewhat poorer for washing and boiler use. A detailed discussion of the quality of the water from each basin will be found in the descriptions of the basins.

[1] The term "alkali" is used to designate the common salts formed on evaporation of natural waters. The principal alkali salts are sodium carbonate (sal soda), or black alkali, and sodium sulphate (Glauber's salt) and sodium chloride (table salt), or white alkalies.

1920

NOTE.—The papers included in the annual volume "Contributions to the hydrology of the United States" are issued separately, with the final pagination, as soon as they are ready. The last paper will include a volume index, title-page, and table of contents for the use of those who may wish to bind the separate parts. A small edition of the bound volume will also be issued, but copies can not be supplied to those who have received all the parts. On account of the congestion of printing caused by the war no volume of the "Contributions" for 1918 was issued.

SURFACE WATER SUPPLY OF THE NORTH ATLANTIC SLOPE DRAINAGE BASINS, 1917.

AUTHORIZATION AND SCOPE OF WORK.

This volume is one of a series of 14 reports presenting results of measurements of flow made on streams in the United States during the year ending September 30, 1917.

The data presented in these reports were collected by the United States Geological Survey under the following authority contained in the organic law (20 Stat. L., p. 394):

Provided, That this officer [the Director] shall have the direction of the Geological Survey and the classification of public lands and examination of the geological structure, mineral resources, and products of the national domain.

The work was begun in 1888 in connection with special studies relating to irrigation in the arid West. Since the fiscal year ending June 30, 1895, successive sundry civil bills passed by Congress have carried the following item and appropriations:

For gaging the streams and determining the water supply of the United States, and for the investigation of underground currents and artesian wells, and for the preparation of reports upon the best methods of utilizing the water resources.

Annual appropriations for the fiscal years ending June 30, 1895–1917.

1895	$12,500
1896	20,000
1897 to 1900, inclusive	50,000
1901 to 1902, inclusive	100,000
1903 to 1906, inclusive	200,000
1907	150,000
1908 to 1910, inclusive	100,000
1911 to 1917, inclusive	150,000

In the execution of the work many private and State organizations have cooperated, either by furnishing data or by assisting in collecting data. Acknowledgments for cooperation of the first kind are made in connection with the description of each station affected; cooperation of the second kind is acknowledged on page 11.

Measurements of stream flow have been made at about 4,240 points in the United States and also at many points in Alaska and the Hawaiian Islands. In July, 1917, 1,180 gaging stations were being maintained by the Survey and the cooperating organizations. Many miscellaneous discharge measurements are made at other points. In connection with this work data were also collected in regard to precipitation, evaporation, storage reservoirs, river profiles, and water power in many sections of the country and will be made available in water-supply papers from time to time. Information in regard to publications relating to water resources is presented in the appendix to this report.

DEFINITION OF TERMS.

The volume of water flowing in a stream—the "run-off" or "discharge"—is expressed in various terms, each of which has become associated with a certain class of work. These terms may be divided into two groups—(1) those that represent a rate of flow, as second-feet, gallons per minute, miners' inches, and discharge in second-feet per square mile, and (2) those that represent the actual quantity of water, as run-off in depth in inches, acre-feet, and millions of cubic feet. The principal terms used in this series of reports are second-feet, second-feet per square mile, run-off in inches, and acre-feet. They may be defined as follows:

"Second-feet" is an abbreviation for "cubic feet per second." A second-foot is the rate of discharge of water flowing in a channel of rectangular cross section 1 foot wide and 1 foot deep at an average velocity of 1 foot per second. It is generally used as a fundamental unit from which others are computed.

"Second-feet per square mile" is the average number of cubic feet of water flowing per second from each square mile of area drained, on the assumption that the run-off is distributed uniformly both as regards time and area.

"Run-off (depth in inches)" is the depth to which an area would be covered if all the water flowing from it in a given period were uniformly distributed on the surface. It is used for comparing run-off with rainfall, which is usually expressed in depth in inches.

An "acre-foot," equivalent to 43,560 cubic feet, is the quantity required to cover an acre to the depth of 1 foot. The term is commonly used in connection with storage for irrigation.

The following terms not in common use are here defined:

"Stage-discharge relation;" an abbreviation for the term "relation of gage height to discharge."

"Control;" a term used to designate the section or sections of the stream below the gage which determine the stage-discharge relation at the gage. It should be noted that the control may not be the same section or sections at all stages.

The "point of zero flow" for a gaging station is that point on the gage—the gage height—to which the surface of the river would fall if there were no flow.

WATER-STAGE RECORDERS.

EXPLANATION OF DATA.

The data presented in this report cover the year beginning October 1, 1916, and ending September 30, 1917. At the beginning of January in most parts of the United States much of the precipitation in the preceding three months is stored as ground water, in the form of snow or ice, or in ponds, lakes, and swamps, and this stored water passes off in the streams during the spring break-up. At the end of September, on the other hand, the only stored water available for run-off is possibly a small quantity in the ground; therefore the run-off for the year beginning October 1 is practically all derived from precipitation within that year.

The base data collected at gaging stations consist of records of stage, measurements of discharge, and general information used to supplement the gage heights and discharge measurements in determining the daily flow. The records of stage are obtained either from direct readings on a staff gage or from a water-stage recorder that gives a continuous record of the fluctuations. Measurements of discharge are made with a current meter. (See Pls. I, II.) The general methods are outlined in standard textbooks on the measurement of river discharge.

From the discharge measurements rating tables are prepared that give the discharge for any stage, and these rating tables, when applied to the gage heights, give the discharge from which the daily, monthly, and yearly mean discharge is determined.

The data presented for each gaging station in the area covered by this report comprise a description of the station, a table giving results of discharge measurements, a table showing the daily discharge of the stream, and a table of monthly and yearly discharge and run-off.

If the base data are insufficient to determine the daily discharge, tables giving daily gage heights and results of discharge measurements are published.

The description of the station gives, in addition to statements regarding location and equipment, information in regard to any conditions that may affect the constancy of the stage-discharge relation, covering such subjects as the occurrence of ice, the use of the stream for log driving, shifting of control, and the cause and effect of backwater; it gives also information as to diversions that decrease the flow at the gage, artificial regulation, maximum and minimum recorded stages, and the accuracy of the records.

The table of daily discharge gives, in general, the discharge in second-feet corresponding to the mean of the gage heights read each day. At stations on streams subject to sudden or rapid diurnal fluctuations the discharge obtained from the rating table and the mean daily gage height may not be the true mean discharge for the day.

If gage heights are obtained with water-stage recorders the mean daily discharge may be obtained by averaging discharge at regular intervals during the day or by using the discharge integrator, an instrument operating on the principle of the planimeter and containing as an essential element the rating curve of the station.

In the table of monthly discharge the column headed "Maximum" gives the mean flow for the day when the mean gage height was highest. As the gage height is the mean for the day it does not indicate correctly the stage when the water surface was at crest height, and the corresponding discharge was consequently larger than given in the maximum column. Likewise, in the column headed "Minimum" the quantity given is the mean flow for the day when the mean gage height was lowest. The column headed "Mean" is the average flow in cubic feet for each second during the month. On this average flow computations recorded in the remaining columns, which are defined on page 5, are based.

ACCURACY OF FIELD DATA AND COMPUTED RESULTS.

The accuracy of stream-flow data depends primarily (1) on the permanence of the stage-discharge relation and (2) on the accuracy of observation of stage, measurements of flow, and interpretation of records.

A paragraph in the description of the station or footnotes added to the tables gives information regarding the (1) permanence of the stage-discharge relation, (2) precision with which the discharge rating curve is defined, (3) refinement of gage readings, (4) frequency of gage readings, and (5) methods of applying daily gage heights to the rating table to obtain the daily discharge.[1]

For the rating tables "well defined" indicates, in general, that the rating is probably accurate within 5 per cent; "fairly well defined," within 10 per cent; "poorly defined," within 15 to 25 per cent. These notes are very general and are based on the plotting of the individual measurements with reference to the mean rating curve.

The monthly means for any station may represent with high accuracy the quantity of water flowing past the gage, but the figures showing discharge per square mile and depth of run-off in inches may be subject to gross errors caused by the inclusion of large noncontributing districts in the measured drainage area, by lack of information concerning water diverted for irrigation or other use, or by inability to interpret the effect of artificial regulation of the flow of the river above the station. "Second-feet per square mile" and "Run-off (depth in inches)" are therefore not computed if such errors appear probable. The computations are also omitted for

[1] For a more detailed discussion of the accuracy of stream-flow data see Grover, N. C., and Hoyt, J. C., Accuracy of stream-flow data: U. S. Geol. Survey Water-Supply Paper 400, pp. 53-59, 1916.

stations on streams draining areas in which the annual rainfall is less than 20 inches. All figures representing "second-feet per square mile" and "run-off (depth in inches)" previously published by the Survey should be used with caution because of possible inherent sources of error not known to the Survey.

The table of monthly discharge gives only a general idea of the flow at the station and should not be used for other than preliminary estimates; the tables of daily discharge allow more detailed studies of the variation in flow. It should be borne in mind, however, that the observations in each succeeding year may be expected to throw new light on data previously published.

COOPERATION.

The hydrometric work in Maine was carried on in cooperation with the public utilities commission, Benjamin F. Cleaves, chairman, and Paul L. Bean, chief engineer.

In Vermont the work was carried on in cooperation with the State, which was represented by Horace F. Graham, governor, and Herbert M. McIntosh, State engineer.

The work in Massachusetts was carried on in cooperation with the Commonwealth, Samuel W. McCall, governor, and John N. Cole, chairman, commission on waterways and public lands.

Financial assistance has been rendered by the New England Power Co., the Turners Falls Power & Electric Co., the Connecticut Valley Lumber Co., the Holyoke Water Power Co., the International Paper Co., the Connecticut Power Co., and the W. H. McElwain Co.

Work in the State of New York has been conducted under cooperative agreements with the State engineer and surveyor and, since July 1, 1911, with the division of waters of the State conservation commission.

The water-stage recorder on Hudson River, at Spier Falls, N. Y., was inspected by an employee of the Adirondack Electric Power Corporation, Glens Falls, N. Y.

The station on Rappahannock River near Fredericksburg, Va., was maintained in cooperation with the Spottsylvania Power Co.

DIVISION OF WORK.

The data for stations in New England were collected and prepared for publication under the direction of C. H. Pierce, district engineer. The work in Maine was under the immediate supervision of G. C. Danforth, assistant engineer of the public utilities commission, who was assisted by E. W. Conners and F. E. Pressey. The other assistants in New England were Hardin Thweatt, H. W. Fear, M. R. Stackpole, and Hope Hearn.

Data for stations in New York were collected and prepared for publication under the direction of C. C. Covert, district engineer, who was assisted by O. W. Hartwell, E. D. Burchard, A. H. Davison, W. A. James, and Helen Kinney.

For stations in New Jersey, Maryland, and Virginia, the data were collected and prepared for publication under the direction of G. C. Stevens, district engineer, who was assisted by H. J. Jackson, B. L. Hopkins, M. I. Walters, and J. W. Moulton.

The manuscript was assembled and reviewed by W. E. Dickinson.

GAGING-STATION RECORDS.

ST. JOHN RIVER BASIN.

ST. JOHN RIVER AT VAN BUREN, MAINE.

Location.—At international bridge at Van Buren, Aroostook County, about 14 miles above Grand Falls.

Drainage area.—8,270 square miles.

Records available.—May 4, 1908, to September 30, 1917.

Gage.—Gage used since May 6, 1912, painted vertically on second pier from Van Buren end of bridge; zero of gage, 407.69 feet above sea level. From 1908 to 1911 stage was read on a vertical rod attached to pier of sawdust carrier of Hammond's mill, about 700 feet below international bridge, but as published, readings are reduced to datum of bridge gage. Gage read by W. H. Scott.

Discharge measurements.—Made from international bridge.

Channel and control.—Control practically permanent. Banks high, rocky, cleared, and not subject to overflow except in very high freshets.

Extremes of discharge.—Maximum stage recorded during year, 22.8 feet at 7 a. m. June 20 (discharge, 92,700 second-feet); minimum stage recorded, 1.4 feet at 8 a. m. September 30 (discharge, 1,740 second-feet).

Ice.—Stage-discharge relation seriously affected by ice, usually from December to March; estimates based on gage heights at Grand Falls and rating curve derived from measurements at Van Buren.

Regulation.—The little storage above for log driving probably does not materially affect the flow.

Accuracy.—Stage-discharge relation practically permanent except when affected by ice. Rating curve well defined. Gage read to tenths twice daily. Daily discharge ascertained by applying mean daily-gage height to rating table. Records good.

Cooperation.—Winter-gage heights at Grand Falls furnished by H. S. Ferguson, consulting engineer.

No discharge measurements were made at this station during the year ending September 30, 1917.

Daily discharge, in second-feet, of St. John River at Van Buren, Maine, for the year ending Sept. 30, 1917.

MACHIAS RIVER BASIN.

MACHIAS RIVER AT WHITNEYVILLE, MAINE.

Location.—At a wooden highway bridge in Whitneyville, Washington County, 200 feet below a storage dam, 4 miles above Machias.

Drainage area.—465 square miles.

Records available.—October 17, 1903, to September 30, 1917.

Gage.—Chain installed on the wooden highway bridge October 10, 1911; prior to October 3, 1905, chain gage on the Washington County railroad bridge, three-fourths of a mile downstream; October 3, 1905, to October 9, 1911, staff gage on highway bridge at datum of present chain gage. Gage read by I. S. Albee.

Discharge measurements.—Made from railroad bridge or by wading.

Channel and control.—Practically permanent.

Extremes of discharge.—Maximum stage recorded during year, 10.8 feet at 3.45 p. m. June 18 (discharge by extension of rating curve, 6,800 second-feet); minimum stage recorded during year, 3.4 feet several times in November (discharge, 221 second-feet).

Ice.—River usually remains open at the gage, but ice farther downstream occasionally affects the stage-discharge relation.

Regulation.—Opening and closing of gates in storage dam immediately above station each day during low stages of the river cause considerable fluctuation; some log driving every year and jams of short duration occasionally occur.

Accuracy.—Stage-discharge relation practically permanent except when affected by ice. Rating curve fairly well defined between 100 and 4,000 second-feet. Gage read to half-tenths once daily. Daily discharge ascertained by applying rating table to mean daily gage height. Records fair.

Discharge measurements of Machias River at Whitneyville, Maine, during the year ending Sept. 30, 1917.

UNION RIVER BASIN.

WEST BRANCH OF UNION RIVER AT AMHERST, MAINE.

Location.—At highway bridge three-quarters of a mile west of Amherst post office, Hancock County, on road to Bangor, about a mile below highway bridge at old tannery dam.

Drainage area.—[illegible] square miles.

Records available.—July 25, [illegible], to September 30, 1917.

Gage.—Chain, installed June [illegible], 1911, at same datum as old vertical gage nailed to the abutment; read by Mrs. Emma Sumner.

Discharge measurements.—Made from downstream side of the bridge.

Channel and control.—Gravel; unlikely to change except in unusual flood.

Extremes of discharge.—Maximum open-water stage recorded during year, 12.25 feet at [illegible] a. m. April [illegible] (discharge, [illegible] second-feet); a stage of 13.5 feet was recorded March 29, but the stage-discharge relation was affected by ice at the time; minimum stage recorded during year, 5.4 feet several times in October, August, and September (discharge, [illegible] second-feet).

Ice.—Surface ice forms to a considerable thickness and anchor ice is found at the measuring section; stage-discharge relation seriously affected.

Regulation.—Discharge of stream only slightly affected by the operation of the few log-driving dams above the station.

Accuracy.—Stage-discharge relation practically permanent except as affected by backwater from ice and occasional log jams. Rating curve well defined below [illegible] second-feet. Gage read to half-tenths twice daily except from January 3 to April 4, when it was read twice daily three days a week. Daily discharge ascertained by applying rating table to mean daily gage height. Records fair.

Discharge measurements of West Branch of Union River at Amherst, Maine, during the year ending Sept. 30, 1917.

PENOBSCOT RIVER BASIN.

WEST BRANCH OF PENOBSCOT RIVER AT MILLINOCKET, MAINE.

Location.—At Quakish Lake dam and Millinocket mill of Great Northern Paper Co., at Millinocket, Penobscot County.

Drainage area.—1,880 square miles.

Records available.—January 11, 1901, to September 30, 1917.

Gages.—Water-stage recorder at Quakish Lake dam and gages in forebay and tailrace at mill.

Channel and control.—Crest of concrete dam.

Discharge.—Flow computed by considering the flow over the dam, the flow through the wheels, and the water used through the log sluices and filters. The wheels were rated at Holyoke, Mass., before being placed in position and were tested later by numerous tube-float and current-meter measurements. When the flow of the river is less than 2,500 second-feet, all the water generally flows through the wheels of the mill.

Ice.—Determination of discharge not seriously affected by ice; Ferguson Pond, just above entrance to canal, eliminates effect from anchor ice.

Regulation.—Dams at outlets of North Twin and Chesuncook lakes store water on a surface of about 65 square miles, with a capacity of about 32 billion cubic feet. Except during the time (usually in August) when excess water has to be supplied for log driving on the river below Millinocket and for a short time during the spring freshet, run-off is regulated by storage. Records corrected for storage.

Cooperation.—Records furnished by engineers of Great Northern Paper Co.

Monthly discharge of West Branch of Penobscot River at Millinocket, Maine, for the year ending Sept. 30, 1917.

WEST BRANCH OF PENOBSCOT RIVER NEAR MEDWAY, MAINE.

Location.—Just above Nichatou Rapids, half a mile above mouth of East Branch of Penobscot River and town of Medway, Penobscot County, and 2 miles below East Millinocket.

Drainage area.—2,100 square miles.

Records available.—February 20, 1916, to September 30, 1917.

Gage.—Chain gage on left bank used February 20 to August 4, 1916; read by A. T. Read; Gurley 7-day water-stage recorder on left bank used since August 4, 1916.

Discharge measurements.—Made from cable.

Channel and control.—Bed fairly smooth at measuring section; covered with rocks and boulders above and below gage. Channel divides a few hundred feet below gage, but practically entire flow passes to left of Nichatou Rapids; shifts occasionally.

Extremes of discharge.—Maximum stage for period of records, from water-stage recorder, 9.88 feet at 1 p. m., June 16, 1917 (discharge, from extension of rating curve, about 20,000 second-feet); minimum stage recorded, 1.45 feet at 9.45 a. m., January 7, 1917 (discharge, 585 second-feet).

Ice.—Ice forms along banks but main channel remains open; stage-discharge relation not seriously affected.

Regulation.—Flow at ordinary stages completely regulated by dams and storage reservoirs above station.

Accuracy.—Stage-discharge relation changed occasionally during high water when débris was removed from right side on control. Rating curve used February 20, 1916, to June 20, 1917, fairly well defined below 7,000 second-feet; curve used June 21 to September 30, 1917, fairly well defined between 2,000 and 7,000 second-feet. Chain gage read to tenths once daily to August 4, 1916; water-stage recorder used since that date. Daily discharge ascertained by applying daily gage height to rating table until August 4, 1916; August 5 to December 23, 1916, May 15–19, 1917, and June 12–28, 1917, by applying to rating table the mean of 12 bihourly gage heights, and for rest of year by discharge integrator. Records fair.

Cooperation.—Several discharge measurements made by T. W. Clark, hydraulic engineer, Oldtown, Maine.

Discharge measurements of West Branch of Penobscot River near Medway, Maine, during the year ending Sept. 30, 1917.

PENOBSCOT RIVER AT WEST ENFIELD, MAINE.

Location.—At steel highway bridge 1,000 feet below mouth of Piscataquis River and 3 miles west of Enfield railroad station, Penobscot County.

Drainage area.—6,600 square miles.

Records available.—January 1, 1902, to September 30, 1917.

Gages.—Friez water-stage recorder on left bank, downstream side on left bridge abutment, used since December 11, 1912; standard chain gage on upstream side of bridge, used prior to that date; gages set to same datum.

Discharge measurements.—Made from bridge.

Channel and control.—Channel at gage broken by four bridge piers; straight above and below the gage. Banks high and rocky and not subject to overflow. Control is at Passadumkeag Rips, about 5 miles below the gage; a wing dam at this point is overflowed at about gage height 5.5 feet.

Ice.—Stage-discharge relation usually affected by ice from December to April; discharge ascertained by comparison with records at Sunkhaze Rips collected by Thomas W. Clark.

Extremes of discharge.—Maximum stage during year, from water-stage recorder, 17.7 feet at 4 to 8 a. m. June 19 (discharge, from extension of rating curve, about 87,900 second-feet); minimum stage during year, from water-stage recorder, 1.98 feet at 11 a. m. October 8 (discharge, 3,190 second-feet).

Regulation.—Flow since 1900 largely controlled by storage, principally in the lakes tributary to the West Branch. Results not corrected for storage.

Accuracy.—Stage-discharge relation practically permanent except as affected by ice and occasionally by logs. Rating curve well defined. Operation of water-stage recorder satisfactory throughout the year. Daily discharge ordinarily ascertained by applying rating table to average of 24 hourly gage heights; at times of serious fluctuation in stage the daily discharge is ascertained by using the average discharge of 12 two-hour periods. Records good.

Cooperation.—Gage-height record furnished and discharge computed by T. W. Clark, hydraulic engineer, Oldtown, Maine. Several discharge measurements were made by students of University of Maine under direction of Prof. A. C. Lyon.

Discharge measurements of Penobscot River at West Enfield, Maine, during the year ending Sept. 30, 1917.

EAST BRANCH OF PENOBSCOT RIVER AT GRINDSTONE, MAINE.

Location.—At Bangor & Aroostook Railroad bridge half a mile south of railroad station at Grindstone, Penobscot County, one-eighth mile above Grindstone Falls, and about 8 miles above confluence with West Branch at Medway.

Drainage area.—1,100 square miles; includes 270 square miles of Chamberlain Lake drainage basin.

Records available.—October 23, 1902, to September 30, 1917.

Gage.—Chain attached to railroad bridge; read by R. D. Porter.

Discharge measurements.—Made from railroad bridge.

Channel and control.—Practically permanent; stream confined by abutments of bridge and broken by one pier at ordinary stages; velocity of current medium at moderate and high stages but sluggish at low water.

Extremes of discharge.—Maximum stage recorded during year, 12.6 feet at 4.20 p. m. June 19 (discharge, 17,000 second-feet); minimum stage recorded during year, 4.1 feet October 11 to 13 (discharge, 210 second-feet).

Ice.—Ice forms to a considerable thickness at the gage and down to the head of Grindstone Falls, and although the falls usually remain open during the greater part of the winter, the stage-discharge relation is somewhat affected.

Regulation.—Several dams maintained at outlets of a number of lakes and ponds near source of river are regulated for log driving; during the summer and fall gates are generally left open. The basin of the East Branch since about 1840 includes about 270 square miles of territory tributary to Chamberlain Lake that formerly drained into the St. John River basin, the diversion being made through what is known as the Telos canal. Results not corrected for storage and diversions.

Accuracy.—Stage-discharge relation occasionally affected by backwater from logs jams at station and at Grindstone Falls immediately below, and by ice during winter. Rating curve well defined below 9,000 second-feet. Gage read to tenths twice daily except during the winter when it was read three times a week. Daily discharge ascertained by applying rating table to mean daily gage height. Record good, except for winter months for which they are fair.

Discharge measurements of East Branch of Penobscot River at Grindstone, Maine, during the year ending Sept. 30, 1917.

[Made by R. W. Conners.]

MATTAWAMKEAG RIVER AT MATTAWAMKEAG, MAINE.

LOCATION.—At Maine Central Railroad bridge at village of Mattawamkeag, Penobscot County, half a mile above mouth of river.

DRAINAGE AREA.—1,500 square miles.

RECORDS AVAILABLE.—August 26, 1902, to September 30, 1917.

GAGE.—Chain fastened to railroad bridge; read by W. T. Mincher.

DISCHARGE MEASUREMENTS.—Made from the bridge; low-water measurements made by wading at a point about a mile above station.

CHANNEL AND CONTROL.—Practically permanent; channel at bridge broken by two piers.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.3 feet at 7 a. m. and 5 p. m. June 20 (discharge, 23,300 second-feet); minimum stage recorded, 3.6 feet several times in October (discharge, 390 second-feet).

ICE.—Stage-discharge relation usually affected by ice for several months each winter.

REGULATION.—Dams are maintained at outlets of several large lakes and ponds, but the stored water is used only for log driving.

ACCURACY.—Stage-discharge relation occasionally affected by backwater from log jams and, during winter, by ice. Rating curve fairly well defined between 500 and 15,000 second-feet. Gage read to tenths twice daily except from December 13 to April 7, when it was read twice a week. Daily discharge ascertained by applying mean daily gage height to rating table. Open-water records good; winter records fair.

COOPERATION.—Several discharge measurements furnished by T. W. Clark, hydraulic engineer, Oldtown, Maine.

Records for 1916, revised by means of data obtained in 1917, are republished herewith and supersede those published in Water-Supply Paper 431.

Discharge measurements of Mattawamkeag River at Mattawamkeag, Maine, during the year ending Sept. 30, 1917.

NOTE.—Stage-discharge relation affected by ice Jan. 6 to Apr. 5, 1916, and Dec. 14, 1916, to Apr. 7, 1917; discharge determined from gage heights corrected for effect of ice by means of discharge measurements, observer's notes, weather records, and comparison with records of East Branch of Penobscot River at Grindstone. Discharge May 5-10 estimated by comparison with records of flow of near-by streams.

Monthly discharge of Mattawamkeag River at Mattawamkeag, Maine, for the years ending Sept. 30, 1916-17.

[Drainage area, 1,500 square miles.]

PISCATAQUIS RIVER NEAR FOXCROFT, MAINE.

LOCATION.—At Low's highway bridge, about halfway between Guilford and Foxcroft, Piscataquis County, three-fourths mile above mouth of Black Stream and 3 miles below Mill Stream.

DRAINAGE AREA.—286 square miles.

RECORDS AVAILABLE.—August 17, 1902, to September 30, 1917.

GAGE.—Staff attached to left abutment of bridge; read by A. F. D. Harlow.

DISCHARGE MEASUREMENTS.—At medium and high stages made from bridge; at low stages made by wading either above or below the bridge.

CHANNEL AND CONTROL.—Practically permanent; banks are high and are overflowed only during extreme floods.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.5 feet at 7 a. m., June 18 (discharge, from extension of rating curve, about 19,800 second-feet); minimum stage recorded, 1.7 feet from 5 p. m., September 15, to 7 a. m., Sepber 17 (discharge, 31 second-feet).

ICE.—Stage-discharge relation affected by ice during some winters.

REGULATION.—The stream is used to develop power at several manufacturing plants above the station; distribution of flow somewhat affected by operation of wheels.

ACCURACY.—Stage-discharge relation occasionally affected by backwater from log jams and by ice during winter. Rating curve fairly well defined between 20 and 4,000 second-feet. Gage read to tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Some uncertainty exists in regard to accuracy of gage heights and the effect of diurnal fluctuation. Records fair.

Discharge measurements of Piscataquis River near Foxcroft, Maine, during the year ending Sept. 30, 1917.

PASSADUMKEAG RIVER AT LOWELL, MAINE.

LOCATION.—About half a mile below dam and highway bridge at Lowell, Penobscot County, and 10 miles above mouth of river.

DRAINAGE AREA.—301 square miles.

RECORDS AVAILABLE.—October 1, 1915, to September 30, 1917.

GAGES.—Chain and staff gages on right bank; read by F. A. Lord. Staff above dam, half a mile upstream, for supplementary use during winter.

DISCHARGE MEASUREMENTS.—Made from cable 20 feet above gage.

CHANNEL AND CONTROL.—Channel rough and somewhat irregular; control about 500 feet below gage; practically permanent. Left bank subject to overflow at gage height 5.5 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.8 feet at 9.30 a. m. April 26 (discharge 2,460 second-feet); minimum open-water stage recorded during year, 1.3 feet at 9 a. m. November 13 (discharge 134 second-feet); minimum discharge, 120 second-feet, November 18–23 (stage-discharge relation affected by ice).

ICE.—Stage-discharge relation usually affected by ice from December to April.

REGULATION.—Distribution of flow somewhat affected by use of storage reservoirs above station. A small dam and mill one-half mile above gage causes fluctuations in stage for a short time each day when mill is in operation.

ACCURACY.—Stage-discharge relation practically permanent, except when affected by backwater due to logs on control or to ice. Rating curve well defined between 70 and 2,600 second-feet. Gage read to tenths once daily until April 18, and to half tenths thereafter. Daily discharge ascertained by applying daily gage height to rating table. Records fair.

COOPERATION.—Discharge measurements made and discharge computed by T. W. Clark, hydraulic engineer, Oldtown, Me.

Discharge measurements of Passadumkeag River at Lowell, Maine, during the year ending Sept. 30, 1917.

KENDUSKEAG STREAM NEAR BANGOR, MAINE.

Location.—At highway bridge at Sixmile Falls, 6 miles northwest of Bangor, Penobscot County, and 7 miles below mouth of Black Stream.

Drainage area.—191 square miles. At high stages a part of the water of Souadabscook Stream finds its way through an artificial cut into Black Stream and thus to the Kenduskeag.

Records available.—September 15, 1908, to September 30, 1917.

Gage.—Chain attached to bridge; read by Fred Cort.

Discharge measurements.—Made from the bridge.

Channel and control.—Practically permanent; channel broken by one pier at the bridge.

Extremes of discharge.—Maximum open-water stage recorded during year, 9.5 feet at 7 a. m. and 4 p. m. April 8 (discharge from extension of rating curve, 4,950 second-feet); maximum stage of 11.2 feet occurred Mar. 29 when stage-discharge relation was affected by ice; minimum stage recorded, 2.0 feet at 7.20 a. m. and 2.00 p. m. September 30 (discharge 52 second-feet).

Ice.—Stage-discharge relation seriously affected by ice for several months.

Diversions.—An artificial cut was made for log driving through a low divide between Souadabscook Stream and Black Stream, which enters the Kenduskeag about 7 miles above the gaging station. During high stages of the Souadabscook, part of its water flows through the artificial cut into the Kenduskeag. Black Stream probably sends its water only to the Kenduskeag.

Accuracy.—Stage-discharge relation fairly permanent except as affected by ice; shifts slightly at infrequent intervals. Rating curve well defined below 2,600 second-feet and fairly well defined between 2,600 and 4,000 second-feet. Gage read to tenths twice daily during open-water period; read twice a week during the winter. Daily discharge ascertained by applying rating table to mean daily gage height. Records good for ordinary stages; for winter records, fair.

Discharge measurements of Kenduskeag Stream near Bangor, Maine, during the year ending Sept. 30, 1917.

KENNEBEC RIVER BASIN.

MOOSEHEAD LAKE AT EAST OUTLET, MAINE.

LOCATION.—At wharf at east outlet of lake, about 8 miles from Kineo, Piscataquis County.

DRAINAGE AREA.—1,240 square miles.

RECORDS AVAILABLE.—April 1, 1895, to September 30, 1917.

GAGE.—Staff at end of boat landing; two datums have been used at east outlet; the first (or original datum) is 1,011.30 feet above mean sea level and approximately 10 feet below sills of outlet gates; gage is read to this datum; the second, to which all gage readings published to and including 1911 have been referred, is 10 feet higher; that is, the zero is at the sill of the gates; as it is believed that low water may go below the sill of the gates (zero of second datum), gage heights since 1912 are published as read—that is, to original datum.

REGULATION.—The lake is regulated to a capacity of 23,735,000,000 cubic feet. The dam at the east outlet is controlled by 39 gates; the sills of the gates being at elevations varying from 8.0 feet to 11.4 feet (original datum). At extreme low stages the flow from the lake is controlled not by the gates but by a bar above the dam at an approximate gage height of 9 feet (original datum). The records show only fluctuations in the level of the lake and are used in the studies of regulation of the lake and in computing the natural flow of the Kennebec at The Forks station.

COOPERATION.—Record furnished by Hollingsworth & Whitney Co.

Daily gage height, in feet, of Moosehead Lake at east outlet, Maine, for the year ending Sept. 30, 1917.

KENNEBEC RIVER AT THE FORKS, MAINE.

Location.—At wooden highway bridge about 1,000 feet above mouth of Dead River at The Forks, Somerset County.

Drainage area.—[illegible] square miles.

Records available.—September 28, 1901, to September 30, 1917.

Gages.—Chain gage, to which a vertical staff on concrete retaining wall on left bank [illegible] feet above bridge, and a Barrett 7-day water-stage recorder in [illegible] adjustment; recorder set to read the same as chain gage at low water, but gives lower readings than chain gage at high water; used during summer months only. Chain gage read by [illegible].

Discharge measurements.—Made from the bridge.

Channel and control.—Channel at bridge is subject to slight changes; control is occasionally affected by backwater from Dead River.

Extremes of discharge.—Maximum stage recorded during year, [illegible] feet, from [illegible] p. m. June [illegible] (discharge, by extension of rating curve, [illegible] second-feet); minimum stage recorded during year, [illegible] feet on October 24 (discharge, [illegible] second-feet).

Ice.—Stage-discharge relation seriously affected by ice for several months.

Regulation.—Flow regulated by storage in Moosehead Lake. During May, June, July, and August the operation of Indian Pond for log driving causes a large diurnal fluctuation. Records of monthly discharge have been reduced to natural flow by adding or subtracting the amount of water stored in or released from Moosehead Lake.

Accuracy.—Stage-discharge relation occasionally affected by backwater from Dead River and by ice during the winter. Rating curve fairly well defined, a table of relation being used to convert discharge rating for chain gage to a corresponding rating for water-stage recorder. Water-stage recorder in operation October 1 to November 15 and April 26 to September 30; chain gage read to half-tenths once daily November 16 to April 25. Daily discharge for period when water-stage recorder was in operation determined by use of discharge integrator; for period when water-stage recorder was not in operation, discharge ascertained by applying rating table to mean daily gage height. Records fair.

Discharge measurements of Kennebec River at The Forks, Maine, during the year ending September 30, 1917.

DEAD RIVER AT THE FORKS, MAINE.

LOCATION.—One-eighth mile above farm house of Jeremiah Durgin, 1½ miles west of The Forks, Somerset County.

DRAINAGE AREA.—878 square miles.

RECORDS AVAILABLE.—September 29, 1901, to August 15, 1907; March 16, 1910, to September 30, 1917.

GAGE.—Scale bolted to large boulder on left bank; read by H. J. Farley.

DISCHARGE MEASUREMENTS.—Made from cable 700 feet above gage.

CHANNEL AND CONTROL.—Stream bed rough; control practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage during year, about 7.9 feet on morning of June 21; discharge about 22,900 second-feet; minimum open-water stage recorded during year, 0.5 foot, several times in October and November; discharge, from extension of rating curve, 100 second-feet.

ICE.—Stage-discharge relation seriously affected by ice.

REGULATION.—A number of dams on lakes above; used for log driving during May and June.

ACCURACY.—Stage-discharge relation practically permanent except when affected by ice or log jams. Rating curve fairly well defined. Gage read to half-tenths twice daily, except during winter when it is read twice a day, three times a week. Daily discharge determined by applying mean daily gage height to rating curve. Open-water record good; winter record fair.

Discharge measurements of Dead River at The Forks, Maine, during the year ending Sept. 30, 1917.

31	160	....	610	510	....	3,050	....	3,980	....	14,000	1,400	....

NOTE.—Stage-discharge relation affected by ice Dec. 26 to Apr. 4; discharge determined from a study of observed gage heights, two discharge measurements, temperature records, and hydrograph comparison with East Branch of Penobscot River at Grindstone; affected by log jams Sept. 11–30, and discharge determined by comparisons with near-by streams. Discharge estimated Apr. 5–6, and also June 18, 21, and July 31, when water was over the gage.

Monthly discharge of Dead River at The Forks, Maine, for the year ending Sept. 30, 1917.

[Drainage area, 878 square miles.]

SEBASTICOOK RIVER AT PITTSFIELD, MAINE.

Location.—At steel highway bridge just above Maine Central Railroad bridge in Pittsfield, Somerset County.

Drainage area.—320 square miles.

Records available.—July 27, 1908, to September 30, 1917.

Gage.—Chain attached to highway bridge; read by C. D. Morrill.

Discharge measurements.—Made from the highway bridge.

Channel and control.—Practically permanent; banks high and rocky and not subject to overflow.

Extremes of discharge.—Maximum stage recorded during year, 7.7 feet at 6.20 a. m. June 19 (discharge, 5,590 second-feet); minimum stage recorded during year, 2.7 feet at 6 a. m. October 10 and 9 a. m. and 6 p. m. October 15 (discharge, 148 second-feet).

Ice.—Stage-discharge relation not seriously affected by ice, as the rapid fall and the proximity of the power plant immediately above station tend to keep river open.

Regulation.—About 800 feet upstream from the station is the dam of the American Woolen Co. (Pioneer Mills) and the Smith Textile Co.; and about half a mile farther upstream is the dam of the American Woolen Co.'s Waverly Mill; the storage of water at these dams causes diurnal fluctuation at the gage.

Accuracy.—Stage-discharge relation shifts occasionally. Rating curve fairly well defined. Gage read to tenths twice daily. Owing to lack of exact information in regard to the stage at night when mills are shut down, figures for daily discharge are not published.

The following discharge measurement was made by F. E. Pressey:

May 15, 1917: Gage height, 3.70 feet; discharge, 602 second-feet.

Twice-daily discharge, in second-feet, of [illegible] River at Pittsfield, Maine, for the year ending Sept. 30, [illegible].

ANDROSCOGGIN RIVER BASIN.

ANDROSCOGGIN RIVER AT ERROL DAM, N. H.

Location.—At Errol dam, 1 mile above Errol, Coos County.

Drainage area.—1,095 square miles.

Records available.—January 1, 1905, to September 30, 1917.

Gage.—Movable rod gage; readings taken daily from sill of deep gate No. 6; elevation of zero of gage or sill of gate, 1,231.3 feet above mean sea level.

Discharge.—Computed from discharge through 14 gates in the dam by means of coefficients determined from a few discharge measurements.[1]

Ice.—Stage-discharge relation little affected by ice.

Regulation.—Errol dam regulates the storage of Umbagog Lake, the lower of the Rangeley series of lakes, comprising the principal storage of Androscoggin River and amounting to nearly 20 billion cubic feet, and also a recently developed storage site on Magalloway River created by the Aziscohos Dam, which amounts to about 9.6 billion cubic feet, thus making the total storage about 29.6 billion cubic feet. Errol dam is about 5 miles below outlet of Umbagog Lake and about 3.5 miles below mouth of Magalloway River, thus making this stream one of the feeders of Umbagog Lake. Results not corrected for storage.

Cooperation.—Records obtained and computations of daily discharge made under direction of Walter H. Sawyer, agent for Union Water Power Co., Lewiston, Me.

Daily discharge, in second-feet, of Androscoggin River at Errol dam, N. H., for the year ending Sept. 30, 1917.

Monthly discharge of Androscoggin River at Errol dam, N. H., for the year ending Sept. 30, 1917.

[Drainage area, [illegible] square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
November	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
December	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
January	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
February	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
March	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
April	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
May	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
June	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
July	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
August	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
September	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
The year	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

NOTE.—The monthly discharge in second-feet per square mile and the run-off in depth in inches do not represent the natural flow from the basin because of artificial storage.

ANDROSCOGGIN RIVER AT BERLIN, N. H.

LOCATION.—At upper or sawmill dam of Berlin Mills Co., at Berlin, Coos County.

DRAINAGE AREA.—[illegible] square miles.

RECORDS AVAILABLE.—October 1, [illegible], to September 30, 1917.

GAGES.—Fixed gages are maintained in the river above the forebay racks and in the tailrace immediately below the outlet of the wheels. These gages are referred to the same datum, and the differences in the readings give the head acting on the wheels. A gage is also attached to each wheel gate, from which the wheel-gate opening can be ascertained.

DETERMINATION OF DISCHARGE.—Discharge computed from curves prepared from Holyoke tests of the wheel runners, using the head and gate openings as ascertained from the gages. Quantity of water wasted over the dam is computed by the Francis formula for discharge over weirs.

ICE.—Stage-discharge relation not affected by ice.

REGULATION.—Under an agreement between the power users on Androscoggin River, the flow at Berlin, N. H., is maintained at a minimum of [illegible] second-feet and at such a point above [illegible] second-feet as is consistent with the constant maintenance of that quantity. Final regulation of the river is made at Pontook dam, N. H., above which is a pond containing about a day's supply; the primary regulation is made at Errol, N. H., about 30 miles above Berlin.

COOPERATION.—Gages are under the direction of George P. Abbott, of the Berlin Mills Co., and discharge record is furnished for publication by Walter H. Sawyer, agent for Union Water Power Co., Lewiston, Maine.

Daily discharge, in second-feet, of Androscoggin River at Berlin, N. H., for the year ending Sept. 30, 1917.

NOTE.—Discharge Sept. 3 estimated.

Monthly discharge of Androscoggin River at Berlin, N. H., for the year ending Sept. 30, 1917.

[Drainage area, 1,350 square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	2,600	1,800	2,000	1.48	1.71
November	2,850	1,930	2,100	1.56	1.74
December	3,500	1,900	2,170	1.61	1.86
January	2,150	1,980	2,070	1.53	1.76
February	2,550	2,150	2,260	1.67	1.74
March	2,650	2,250	2,450	1.81	2.09
April	5,900	1,830	3,140	2.33	2.60
May	4,700	3,300	3,880	2.87	3.31
June	20,000	3,600	10,600	7.85	8.76
July	10,600	1,500	2,860	2.12	2.44
August	2,700	1,700	2,030	1.50	1.73
September	2,400	1,700	2,010	1.52	1.70
The year	20,000	1,500	3,120	2.31	31.44

NOTE.—The monthly discharge in second-feet per square mile and the run-off in depth in inches do not represent the natural flow from the basin because of artificial storage. The yearly discharge and run-off doubtless represent more nearly the natural flow, for probably little stored water is held over from year to year.

ANDROSCOGGIN RIVER AT RUMFORD FALLS, MAINE.

Location.—At dam of Rumford Falls Power Co. at Rumford, Oxford County.

Drainage area.—2,090 square miles.

Records available.—May 18, 1892, to September 30, 1917.

Gages.—One in pond above dam; another in tailrace of power house.

Discharge.—Computed from discharge over the dam by use of the Francis weir formula with modified coefficient, and the quantities passing through the various wheels of the power house, which have been carefully rated.

Ice.—Stage-discharge relation little affected by ice.

Regulation.—Storage in Rangeley system of lakes at headwaters of Androscoggin River aggregates about 29.6 billion cubic feet. The stored water is regulated in the interests of the water-power users below. Results not corrected for storage.

Cooperation.—Records obtained and computations made by Charles A. Mixer, engineer, Rumford Falls Power Co.

Daily discharge, in second-feet, of Androscoggin River at Rumford Falls, Maine, for the year ending Sept. 30, 1917.

Day.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.

Monthly discharge of Androscoggin River at Rumford Falls, Maine, for the year ending Sept. 30, 1917.

[Drainage area, 2,090 square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	3,640	1,930	2,540	1.22	1.41
November	4,960	1,970	2,630	1.26	1.41
December	8,950	2,050	2,990	1.43	1.65
January	2,930	2,030	2,510	1.20	1.38
February	2,910	2,150	2,510	1.20	1.25
March	7,640	2,340	3,220	1.54	1.78
April	13,500	3,470	6,070	2.90	3.24
May	7,430	4,930	5,690	2.72	3.14
June	30,300	4,720	12,200	5.85	6.53
July	8,310	2,090	3,220	1.54	1.78
August	5,380	2,000	2,990	1.43	1.65
September	2,870	1,800	2,350	1.12	1.25
The year	30,300	1,800	4,070	1.95	26.47

NOTE.—The monthly discharge in second-feet per square mile and the run-off in depth in inches do not represent the natural flow from the basin because of artificial storage.

MAGALLOWAY RIVER AT AZISCOHOS DAM, MAINE.

LOCATION.—At Aziscohos dam, Oxford County, about 15 miles above mouth.

DRAINAGE AREA.—215 square miles.

RECORDS AVAILABLE.—January 1, 1912, to September 30, 1917.

GAGE.—Vertical staff in two sections, the lower attached to one of the concrete buttresses of the dam and the upper on the concrete gate tower.

DETERMINATION OF DISCHARGE.—Discharge determined from readings of gate openings. Gates have been rated by current-meter measurements at a station about a mile below the dam.

REGULATION.—The capacity of the storage reservoir above the dam is 9,593,000,000 cubic feet, and the discharge is regulated for power interests below. The operation of the gates is planned to maintain as nearly as possible a constant flow at Berlin, N. H. Results not corrected for storage.

COOPERATION.—Discharge computed and furnished for publication by Walter H. Sawyer, agent Union Water Power Co., Lewiston, Maine.

ANDROSCOGGIN RIVER AT RUMFORD FALLS, MAINE.

Location.—At dam of Rumford Falls Power Co. at Rumford, Oxford County.

Drainage area.—2,090 square miles.

Records available.—May 18, 1892, to September 30, 1917.

Gages.—One in pond above dam; another in tailrace of power house.

Discharge.—Computed from discharge over the dam by use of the Francis weir formula with modified coefficient, and the quantities passing through the various wheels of the power house, which have been carefully rated.

Ice.—Stage-discharge relation little affected by ice.

Regulation.—Storage in Rangeley system of lakes at headwaters of Androscoggin River aggregates about 29.6 billion cubic feet. The stored water is regulated in the interests of the water-power users below. Results not corrected for storage.

Cooperation.—Records obtained and computations made by Charles A. Mixer, engineer, Rumford Falls Power Co.

Daily discharge, in second-feet, of Androscoggin River at Rumford Falls, Maine, for the year ending Sept. 30, 1917.

Monthly discharge of Androscoggin River at Rumford Falls, [illegible] Sept. 30, 1917.

[Drainage area, 2,090 square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	3,640	1,930	[illegible]	[illegible]	[illegible]
November	4,960	1,670	[illegible]	[illegible]	[illegible]
December	6,950	2,050	[illegible]	[illegible]	[illegible]
January	2,930	2,030	[illegible]	[illegible]	[illegible]
February	2,910	2,150	[illegible]	[illegible]	[illegible]
March	7,040	2,240	[illegible]	[illegible]	[illegible]
April	12,500	2,450	[illegible]	[illegible]	[illegible]
May	7,430	4,330	[illegible]	[illegible]	[illegible]
June	30,300	4,720	[illegible]	[illegible]	[illegible]
July	6,210	2,000	[illegible]	[illegible]	[illegible]
August	5,380	2,000	[illegible]	[illegible]	[illegible]
September	2,870	1,860	[illegible]	[illegible]	[illegible]
The year	30,300	1,860	[illegible]	[illegible]	[illegible]

NOTE.—The monthly discharge in second-feet per square mile and the run-off in depth [illegible] represent the natural flow from the basin because of artificial storage.

MAGALLOWAY RIVER AT AZISCOHOS DAM, MAINE.

LOCATION.—At Aziscohos dam, Oxford County, about [illegible]

DRAINAGE AREA.—215 square miles.

RECORDS AVAILABLE.—January 1, 1912, to September 30, 1917.

GAGE.—Vertical staff in two sections, the lower attached [illegible] tresses of the dam and the upper on the concrete gate house.

DETERMINATION OF DISCHARGE.—Discharge determined [illegible] ings. Gates have been rated by current-meter measurements [illegible] a mile below the dam.

REGULATION.—The capacity of the storage reservoir [illegible] cubic feet, and the discharge is regulated for power [illegible] tion of the gates is planned to maintain [illegible] Berlin, N. H. Results not corrected for storage.

COOPERATION.—Discharge computed and furnished [illegible] [illegible], agent Union Water Power Co., [illegible]

[illegible] t

[illegible] -discharge relation affected by ice.

Monthly discharge of Magalloway River at Aziscohos dam, Maine, for the year ending Sept. 30, 1917.

[Drainage area, 215 square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	1,880	95	1,220	5.67	6.54
November	1,450	86	946	4.40	4.91
December	1,400	87	514	2.39	2.76
January	184	183	183	.85	.98
February	801	165	359	1.67	1.74
March	1,560	164	957	4.45	5.13
April	1,070	76	240	1.12	1.25
May	1,200	81	277	1.29	1.49
June	4,680	99	1,650	7.67	8.56
July	1,610	216	404	1.88	2.17
August	1,780	99	548	2.55	2.94
September	1,880	502	1,400	6.53	7.29
The year	4,680	76	724	3.37	45.76

NOTE.—The monthly discharge in second-feet per square mile and the run-off in depth in inches do not represent the natural flow from the basin because of artificial storage. The yearly discharge and run-off doubtless represent more nearly the natural flow, for probably little stored water is held over from year to year.

LITTLE ANDROSCOGGIN RIVER NEAR SOUTH PARIS, MAINE.

LOCATION.—At left end of an old dam at Bisco Falls, 200 feet below highway bridge and 5 miles above South Paris, Oxford County.

DRAINAGE AREA.—75 square miles.

RECORDS AVAILABLE.—September 14, 1913, to September 30, 1917.

GAGE.—Chain on left bank installed April 16, 1914; original gage, a vertical staff, was destroyed by ice March 2, 1914; from March 18 to April 9, 1914, a chain gage on a footbridge was used; all gages referred to same datum and at practically same place. Gage read by G. A. Jackson.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

CHANNEL AND CONTROL.—At low and medium stages water flows through opening at left of old stone dam; opening was enlarged by high water of April 9, 1914; water flows over dam at gage height 5.30 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.4 feet at 7 p. m. June 12 (discharge, 2,070 second-feet); minimum stage recorded during year, 1.5 feet several times in July and August (discharge, 20 second-feet).

ICE.—Control remains open throughout the winter; stage-discharge relation not affected by ice.

REGULATION.—Storage at Snows Falls, 1½ miles above the station, and at West Paris, 4 miles above, has some effect on regimen of stream.

ACCURACY.—Stage-discharge relation changed at the time of high water April 9, 1914; otherwise practically permanent. Rating curve well defined below 700 second-feet and fairly well defined between 700 and 1,800 second-feet. Gage read to tenths once daily. Daily discharge ascertained by applying rating table to daily gage height. Records good except for times of sudden changes in stage, when the number of gage readings is insufficient to determine accurately the mean daily flow.

Discharge measurements of Little Androscoggin River near South Paris, Maine, during the year ending Sept. 30, 1917.

[Made by G. C. Danforth.]

PRESUMPSCOT RIVER BASIN.

PRESUMPSCOT RIVER AT OUTLET OF SEBAGO LAKE, MAINE.

Location.—At outlet dam at Sebago Lake and hydroelectric plant at Eel Weir Falls, Cumberland County, 1 mile below lake outlet.

Drainage area.—436 square miles.

Records available.—January 1, 1887, to September 30, 1917. Results of a recomputation of all data from 1887 to 1911 are published in the second annual report of Maine State Water Storage Commission.

Gages.—On bulkhead of gatehouse at outlet dam and in forebay and tailrace of power plant.

Discharge.—Prior to March, 1904, discharge was determined from records of opening of gates in dam; since March, 1904, flow from lake has been recorded by three Allen meters, one on each of three pairs of 30-inch Hercules wheels; wheels and recording meters checked by current-meter measurements, brake tests of wheels, and electrical readings of the generator output. Water wasted at regulating gates is measured from records of gate openings and coefficients determined from current-meter measurements.

Ice.—Stage-discharge relation not affected by ice.

Regulation.—Sebago Lake (area, 46 square miles) is under complete regulation. Results not corrected for storage.

Cooperation.—Entire record furnished by S. D. Warren Co.

Daily discharge, in second-feet, of Presumpscot River at outlet of Sebago Lake, Maine, for the year ending Sept. 30, 1917.

Monthly discharge of Presumpscot River at outlet of Sebago Lake, Maine, for the year ending Sept. 30, 1917.

[Drainage area, 436 square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	902	242	761	1.75	2.02
November	882	317	768	1.76	1.96
December	845	222	704	1.61	1.86
January	858	277	737	1.69	1.95
February	845	283	755	1.73	1.80
March	845	213	734	1.68	1.94
April	888	212	699	1.60	1.78
May	842	247	714	1.64	1.89
June	2,730	245	1,560	3.58	3.99
July	2,480	182	1,150	2.64	3.04
August	790	210	691	1.58	1.82
September	832	45	677	1.55	1.73
The year	2.730	45	828	1.90	25.78

NOTE.—The monthly discharge in second-feet per square mile and the run-off in depth in inches do not represent the natural flow from the basin because of artificial storage. The yearly discharge and run-off doubtless represent more nearly the natural flow, for probably little stored water is held over from year to year.

SACO RIVER BASIN.

SACO RIVER AT CORNISH, MAINE.

LOCATION.—At highway bridge at Cornish, York County, half a mile below mouth of Ossipee River.

DRAINAGE AREA.—1,300 square miles.

RECORDS AVAILABLE.—June 4, 1916, to September 30, 1917.

GAGE.—Chain attached to bridge; read by S. J. Elliott.

DISCHARGE MEASUREMENTS.—Made from bridge.

CHANNEL AND CONTROL.—Bed covered with sand and boulders. Channel broken by one pier at bridge.

EXTREMES OF DISCHARGE.—Maximum stage during period covered by record, 9.4 feet at 6.30 a. m. June 18, 1917 (discharge, from extension of rating curve, about 17,400 second-feet); minimum stage recorded, 0.8 foot at 4.30 p. m. August 16, 6.30 a. m. September 11 and September 22, 1917 (discharge, from extension of rating curve, about 635 second-feet).

ICE.—Stage-discharge relation seriously affected by ice which forms to considerable thickness.

REGULATION.—The operation of power plants at Swan Falls and Kezar Falls probably has little effect on flow at station.

ACCURACY.—Stage-discharge relation seriously affected by ice December to April. Rating curve fairly well defined between 1,000 and 9,000 second-feet. Daily discharge ascertained by applying mean daily gage height to rating table. Open-water records good; winter records fair.

Discharge measurements of Saco River at Cornish, Maine, during the year ending Sept. 30, 1917.

OSSIPEE RIVER AT CORNISH, MAINE.

LOCATION.—At highway bridge in Cornish, York County, 1¼ miles above confluence with Saco River.

DRAINAGE AREA.—448 square miles.

RECORDS AVAILABLE.—July 5, 1916, to September 30, 1917.

GAGE.—Chain attached to bridge; read by O. W. Adams.

DISCHARGE MEASUREMENTS.—Made from bridge.

CHANNEL AND CONTROL.—Bed covered with sand and gravel; possibly shifting somewhat. Channel broken by one pier at bridge.

EXTREMES OF DISCHARGE—Maximum stage during period covered by record, 7.25 feet at 6 a. m. June 18, 1917 (discharge, from extension of rating curve, about 6,480 second-feet); minimum stage, 1.0 feet several times in September and October, 1916, and 7 a. m. September 22, and 2 p. m. September 23, 1917 (discharge, 320 second-feet).

ICE.—Stage-discharge relation seriously affected by ice which forms to considerable thickness.

REGULATION.—Flow affected by dams at Kezar Falls and at outlet of Great Ossipee Lake.

ACCURACY.—Stage-discharge relation affected by ice December 14 to March 26. Rating curve fairly well defined between 350 and 2,400 second-feet. Gage read to half tenths once daily. Discharge determined by applying daily gage height to rating table. Records fair.

MERRIMACK RIVER BASIN.

MERRIMACK RIVER AT FRANKLIN JUNCTION, N. H.

LOCATION.—At covered wooden bridge of Boston & Maine Railroad near Franklin Junction, Merrimack County, about a mile below confluence of Pemigewasset and Winnepesaukee rivers.

DRAINAGE AREA.—1,460 square miles.

RECORDS AVAILABLE.—July 8, 1903, to September 30, 1917.

GAGE.—Chain gage fastened to floor of bridge on upstream side over west channel; read by F. R. Roers. A gage painted on the downstream right-hand side of the center pier of the bridge is considerably in error for low stages.

DISCHARGE MEASUREMENTS.—Made from upstream side of bridge.

CHANNEL AND CONTROL.—Bed composed of coarse gravel and boulders; fairly permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 15.1 feet at 5 p. m. June 18 (discharge, by extension of rating curve, 22,500 second-feet); minimum stage recorded, 3.95 feet at 6 a. m. August 13 (discharge, 1,040 second-feet).

ICE.—Stage-discharge relation seriously affected by ice during most winters.

REGULATION.—Flow affected by storage in Winnepesaukee, Squam, and New Found Lakes and by the operation of mills above the station.

ACCURACY.—Stage-discharge relation practically permanent except as affected by ice December 17 to March 28. Rating curve fairly well defined below 10,000 second-feet. Gage read to half-tenths twice daily as a rule but readings were omitted at frequent intervals; accuracy of readings somewhat uncertain. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during winter. Records fair.

COOPERATION.—Gage-height record furnished by the proprietors of locks and canals on Merrimack River, Lowell, Mass.

The following discharge measurement was made by M. R. Stackpole:

July 16, 1917: Gage-height 4.83 feet; discharge 1,870 second-feet.

Daily discharge, in second-feet, of Merrimack River at Franklin Junction, N. H., for the year ending Sept. 30, 1907.

NOTE.—Discharge on Sundays and other days when gage was not read estimated by comparison with other gaging stations.

Monthly discharge of Merrimack River at Franklin Junction, N. H., for the year ending Sept. 30, 1907.

[Drainage area, 1,460 square miles.]

Month.	Discharge in second-feet.				Run-off (depth in inches on drainage area).
	Maximum.	Minimum.	Mean.	Per square mile.	
October	2,280	1,440	1,670	1.14	1.31
November	4,660	1,080	1,780	1.22	1.36
December	20,800	1,450	2,850	1.95	2.25
January			1,550	1.06	1.22
February			1,280	.983	.90
March			3,430	2.35	2.71
April	15,700	3,120	6,730	4.61	5.14
May	6,000	3,790	5,070	3.47	4.00
June	20,500	3,450	7,290	4.99	5.57
July	4,300	1,350	2,180	1.49	1.72
August	1,930	1,080	1,440	.986	1.14
September	1,930	1,170	1,480	1.01	1.13
The year	20,500	1,080	3,060	2.10	28.45

NOTE.—Mean monthly discharge for January, February, and March estimated on basis of 1.7 times discharge of Pemigewasset River at Plymouth plus discharge from Lake Winnepesaukee at Lakeport.

MERRIMACK RIVER AT LAWRENCE, MASS.

Location.—At dam of Essex Co. in Lawrence, Essex County.

Drainage area.[1]—Total of Merrimack River basin above Lawrence, 4,663 square miles; net drainage area, exclusive of diverted parts of Nashua and Sudbury River and Lake Cochituate basins, 4,552 square miles.

Records available.—January 1, 1880, to September 30, 1917.

Computations of discharge.—Accurate record is kept of the flow over the dam and through the various wheels and gates. This flow includes the water wasted into the Merrimack from the Nashua, Sudbury, and Cochituate drainage basins. Estimates of the quantity wasted from these basins is furnished by the Metropolitan Water and Sewerage Board of Boston and subtracted from the quantity measured at Lawrence to obtain the net flow from the net drainage area of 4,452 square miles.

Diversions.—Practically the entire flow of the South Branch of Nashua River, Sudbury River, and Lake Cochituate is diverted for use by the Metropolitan water district of Boston.

Regulation.—Flow regulated to some extent by storage in Lake Winnepesaukee. The low water flow of the stream is affected by operation of various power plants above Lawrence.

Storage.—There are several reservoirs in the basin. It is estimated that the water surface is about 3.5 per cent of the entire drainage area.

Cooperation.—The entire record has been furnished by R. A. Hale, principal assistant engineer of the Essex Co. Record changed to climatic year form by engineers of the Geological Survey.

Daily discharge, in second-feet, of Merrimack River at Lawrence, Mass., for the year ending Sept. 30, 1917.

Weekly discharge, in second-feet, of Merrimack River at Lawrence, Mass., for the year ending Sept. 30, 1917.

[Weeks arranged in order of dryness.]

Week ending Sunday—	Measured at Lawrence (total drainage area, 4,663 square miles).	Wasting into Merrimack River from diverted drainage basins (211 square miles).	From net drainage area of 4,452 square miles.	Per square mile of net drainage area.

September	2,465	21	2,444	.549	.613	53.3	1.15
The year	6,536	74	6,462	1.451	19.706	55.4	35.60

NOTE.—The monthly discharge in second-feet, per square mile, and the run-off in depth in inches, shown by the table, do not represent the natural flow from the basin because of artificial storage.

SOUHEGAN RIVER AT MERRIMACK, N. H.

LOCATION.—At the head of Atherton Falls, 7 miles below mouth of Beaver Brook and about 1½ miles above confluence of Souhegan with Merrimack River, at Merrimack, Hillsboro County.

DRAINAGE AREA.—168 square miles.

RECORDS AVAILABLE.—July 13, 1909, to September 30, 1917.

GAGES.—Gurley-printing water-stage recorder on left bank about 350 feet above the falls used since October 15, 1913. A vertical staff on left bank, 40 feet above the falls, was used from July 13, 1909, to April 11, 1911, when it was washed out. From April 12, 1911, to October 14, 1913, a chain gage attached to a tree on left bank 350 feet above the falls was used.

DISCHARGE MEASUREMENTS.—Made by wading below the falls or from cable one-half mile below gage.

CHANNEL AND CONTROL.—The channel opposite the gage is a pool in which velocity is very low. The control of this pool is a rock ledge at the head of Atherton Falls and is permanent.

EXTREMES OF DISCHARGE.—Maximum stage, from water-stage recorder, 7.51 feet at 5 p. m. March 28 (discharge, from extension of rating curve about 3,060 second-feet); minimum stage, from water-stage recorder, 2.06 feet at 9 p. m. September 23 (discharge, 26 second-feet).

1909–1917.—Maximum stage recorded, 9.6 feet, August 5, 1915 (discharge from extension of rating curve about 4,930 second-feet); minimum stage recorded 1.90 feet at 8 a. m. September 8, 1909 (discharge, 15 second-feet).

ICE.—Ice forms on control for short periods in the winter, slightly affecting stage-discharge relation.

REGULATION.—Flow affected by the operation of the mills at Milford about 8 miles above.

ACCURACY.—Stage-discharge relation permanent except when affected by ice for short periods. Rating curve well defined below 2,000 second-feet. Operation of water-stage recorder satisfactory. Daily discharge ascertained by applying rating table to the mean of 24 hourly gage heights with corrections for ice during winter. Records good.

Discharge measurements of Souhegan River at Merrimack, N. H., during the year ending Sept. 30, 1917.

Date.	Made by—	Gage height.	Discharge.

SOUTH BRANCH OF NASHUA RIVER BASIN (WACHUSETT DRAINAGE BASIN) NEAR CLINTON, MASS.

LOCATION.—At Wachusett dam, near Clinton.

DRAINAGE AREA.—119 square miles 1896 to 1907; 118.19 square miles 1908–1913; 108.84 square miles 1914–1917.

RECORDS AVAILABLE.—July, 1896, to September 30, 1917.

REGULATION.—Flow affected by storage in Wachusett reservoir and other ponds. Beginning with 1897 the determinations of discharge have been corrected for gain or loss in the reservoir and ponds so that the record shows approximately the natural flow of the stream.

The yield per square mile is the yield of the drainage area including the water surfaces. For the years 1897 to 1902, inclusive, the water surface amounted to 2.2 per cent of the total area; 1903, 2.4 per cent; 1904, 3.6 per cent; 1905, 4.1 per cent; 1906, 5.1 per cent; 1907, 6.0 per cent; 1908–1915, 7.0 per cent.

COOPERATION.—Record furnished by the Metropolitan Water and Sewerage Board of Boston; rearranged to climatic year form by engineers of the Geological Survey.

Yield and rainfall in South Branch of Nashua River basin (Wachusett drainage basin) near Clinton, Mass., for the year ending Sept. 30, 1917.

[Drainage area, 108.84 square miles.] [a]

[a] Although the drainage area has been changed at different times, quantities in this table correspond to present drainage area.

SUDBURY RIVER AND LAKE COCHITUATE BASINS NEAR FRAMINGHAM AND COCHITUATE, MASS.

DRAINAGE AREA.—Area of Sudbury basin from 1875 to 1878, inclusive, was 77.8 square miles; 1879–80, 78.2 square miles; 1881–1917, 75.2 square miles. Area of Cochituate basin from 1863 to 1909, inclusive, was 18.87 square miles; 1910, 17.8 square miles; 1911 to 1917, 17.58 square miles.

RECORDS AVAILABLE.—Of Sudbury River, January, 1875, to September, 1917; of Lake Cochituate, January, 1863, to September, 1917. Sudbury River and Lake Cochituate have been studied by the engineers of the city of Boston, the State Board of Health of Massachusetts, and the Metropolitan Water and Sewerage Board; records of rainfall have been kept in the Sudbury basin since 1875 and in the Cochituate basin since 1852, but the latter are considered of doubtful accuracy previous to 1872.

REGULATION.—The greater part of the flow from these basins is controlled by storage reservoirs constructed by the city of Boston and the Metropolitan Water and Sewerage Board. Lake Cochituate, which drains into Sudbury River a short distance below Framingham, is controlled as a storage reservoir by the Metropolitan Waterworks. In the Sudbury River basin the water surfaces exposed to evaporation have been increased from time to time by the construction of additional storage reservoirs. From 1875 to 1878, inclusive, the water surface amounted to 1.9 per cent of the total area; from 1879 to 1884, to 3 per cent; 1885 to 1893, to 3.4 per cent; 1894 to 1897, to 3.9 per cent; 1898 and subsequent years, 6.5 per cent.

DETERMINATION OF DISCHARGE.—In determining the run-off of the Sudbury and Cochituate drainage areas, the water diverted for the municipal supply of Framingham, Natick, and Westboro, which discharge their sewage outside the basins, is taken into consideration; the results, however, are probably less accurate since the sewerage diversion works were constructed. The public water and sewerage works were installed in these towns as follows:

Dates of installation of water and sewerage works in Framingham, Natick, and Westboro.

Town.	Water supply.	Sewerage works.
Framingham	1875	1889
Natick	1874	1896
Westboro	1879	1892

Water from the Wachusett drainage area also passes into the reservoirs in the Sudbury basin and must be measured to determine the yield of the Sudbury basin; the small errors unavoidable in the measurement of large quantities of water decrease the accuracy of the determination of the Sudbury water supply during months of low yield for years subsequent to 1897.

COOPERATION.—Record furnished by the Metropolitan Water and Sewerage Board of Boston; form changed to climatic year by engineers of the Geological Survey.

Yield and rainfall in Sudbury River basin near Framingham, Mass., for the year ending Sept. 30, 1917.

[a] Although the drainage area has been changed at different times, quantities in this table correspond to the present area.

CONNECTICUT RIVER BASIN.

CONNECTICUT RIVER AT FIRST LAKE, NEAR PITTSBURG, N. H.

Location.—At outlet of First Lake, 5 miles northeast of Pittsburg, Coos County.

Drainage area.—81.4 square miles. (From surveys by engineers of the Connecticut Valley Lumber Co.)

Records available.—April 1 to September 30, 1917.

Gages.—Inclined staff on right bank about one-fourth mile below the outlet dam; installed in November, 1917, and used in determining sluice gate ratings; scales on gate frames indicate amount of sluice gate openings; staff gage in lake above dam.

Discharge measurements.—Made from log bridge 1 mile below the gage, by wading, or from cable 200 feet above gage.

Channel and control.—Bed rough, with rock bottom. Control for river gage is rock ledge extending completely across the stream with about 3 feet of fall immediately below.

Computation of discharge.—Discharge through 3 sluice gates, 6 feet, 8 feet, and 20 feet in width, determined from gate ratings based on current-meter measurements and comparative readings of river gage; theoretical rating used for a part of the discharge through the 20-foot gate and lower leaf of 6-foot and 8-foot gates, under conditions not covered by the current-meter measurements. Discharge through one water wheel, used when slasher was in operation, determined from figures of water-wheel efficiency and power output.

Ice.—Little effect from ice on the control section for river gage; formation of ice in the sluice materially changes conditions at gates.

Regulation.—About 4.1 billion cubic feet of storage has been developed in lakes and ponds above gage; records of monthly discharge have been corrected for effect of storage in First Lake but not for effect of storage in lakes tributary to First Lake.

Accuracy.—Discharge through the gates possibly affected by ice April 1–7. Rating curves well defined for middle and upper leaves of the 6-foot and 8-foot gates; theoretical ratings for the 20-foot gate for high stages of the lake and for lower leaves of 6-foot and 8-foot gates, not completely checked by current-meter measurements. Daily discharge ascertained by applying rating tables to records of gate openings, giving due consideration to times of opening and closing gates and changes in gate settings. Records good, except for few days in April, when accuracy of results may have been affected by ice.

No discharge measurements were made prior to September 30, 1917.

Daily gage height, in feet, of First Lake near Pittsburg, N. H., for the year ending Sept. 30, 1917.

Day.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.

CONNECTICUT RIVER AT ORFORD, N. H.

LOCATION.—At covered highway bridge between Orford, N. H., and Fairlee, Vt., approximately 10 miles downstream (by river) from mouth of Waits River.

DRAINAGE AREA.—3,100 square miles.

RECORDS AVAILABLE.—August 6, 1900, to September 30, 1917.

GAGES.—Inclined staff on left bank 25 feet below bridge; chain attached to upstream side of bridge is also used at certain stages.

DISCHARGE MEASUREMENTS.—Open-water measurements made from cable.

CHANNEL AND CONTROL.—Channel wide and deep, with gravelly bottom; control for high stages is probably at the dam at Wilder, 20 miles below station.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 21.3 feet at 7 a. m. and 6 p. m. April 24 (discharge, 29,500 second-feet); minimum stage recorded, 4.6 feet several times in September (discharge, 1,720 second-feet). Minimum discharge of 1,550 second-feet occurred February 25, when the stage-discharge relation was affected by ice.

1900–1917: Maximum stage recorded, 33.4 feet at 12 noon March 28, 1913 (discharge, by extension of rating curve, about 57,300 second-feet); minimum 24-hour discharge, 288 second-feet, September 28, 1908.

ICE.—Stage-discharge relation seriously affected by ice December to March; ice cover usually remains in place throughout winter.

REGULATION.—About 4.1 billion cubic feet of storage has been developed in First Lake and in lakes and ponds tributary to First Lake; natural flow not seriously affected by use of stored water prior to September 30, 1916.

ACCURACY.—Stage-discharge relation affected at times by use of flashboards at Wilder dam and, during the winter, by ice. Several rating curves adjusted to condition of flashboards were used during the year. Gage read to tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good, except for September, for which they are fair.

Discharge measurements of Connecticut River at Orford, N. H., during the year ending Sept. 30, 1917.

CONNECTICUT RIVER AT SUNDERLAND, MASS.

LOCATION.—At five-span steel highway bridge at Sunderland, Franklin County, on road leading to South Deerfield, about 18 miles in a direct line and 24 miles by river above dam at Holyoke. Deerfield River enters the Connecticut from the west about 8 miles above the station.

DRAINAGE AREA.—8,000 square miles.

RECORDS AVAILABLE.—March 31, 1904, to September 30, 1917. From 1880 to 1899 records were obtained at Holyyoke, Mass.

GAGES.—Chain on downstream side of bridge; read by V. Lawer. Sanborn water-stage recorder on left bank, installed September 3, 1916.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

CHANNEL AND CONTROL.—Channel deep; bottom of coarse gravel and alluvial deposits. Control at low stages not well defined but practically permanent; at high stages the control is at the crest of the dam at Holyoke.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 20.0 feet at 7 a. m. March 30 (discharge, 63,700 second-feet); minimum stage recorded, 0.8 foot at 7. a. m. September 24 (discharge, 880 second-feet).

1904–1917: Maximum stage recorded, 30.7 feet during the night of March 28, 1913, determined by leveling from flood marks (discharge, computed from extension of rating curve, about 108,000 second-feet[1]); minimum stage recorded, 0.6 foot September 28, 1914 (discharge, computed from extension of rating curve, about 700 second-feet).

ICE.—The river usually freezes over early in the winter but the ice is likely to break up at times of sudden rises in stage and at those times it occasionally forms ice jams at Northampton, 10 miles below the station, causing several feet of backwater at the gage.

REGULATION.—Distribution of flow affected by operation of power plants at Turners Falls, Mass., and by regulation of Deerfield River. The effect of the regulation is shown by low water at the gage on Sundays and Mondays. Storage in Somerset reservoir and First Lake has very little effect on the run-off as observed at Sunderland.

[1] Supersedes figures previously published.

Accuracy.—Stage-discharge relation practically permanent except when affected by ice. Rating curve well defined between 1,[illegible] and [illegible] second-feet. Chain gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good except for extremely high and low stages and for times of ice effect, for which they are fair.

Discharge measurements of Connecticut River at Sunderland, Mass., during the year ending Sept. 30, 1917.

PASSUMPSIC RIVER AT PIERCE'S MILLS, NEAR ST. JOHNSBURY, VT.

LOCATION.—At suspension footbridge just below Pierce's mills, about 2 miles below mouth of Sheldon Branch, 4 miles above mouth of Moose River, and 5 miles north of St. Johnsbury, Caledonia County.

DRAINAGE AREA.—237 square miles.

RECORDS AVAILABLE.—May 26, 1909, to September 30, 1917.

GAGE.—Staff in two sections; low-water section, a vertical staff bolted to ledge just above bridge; high-water section, an inclined staff bolted to ledge below bridge; read by Joseph Cox and W. I. Cox.

DISCHARGE MEASUREMENTS.—Made from footbridge or by wading below the bridge.

CHANNEL AND CONTROL.—Bed composed of ledge rock partly covered with gravel and alluvial deposits. At high stages the control is probably at the dam near Centervale.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.5 feet at 8 p. m. November 30 (discharge, by extension of rating curve, about 3,630 second-feet); minimum stage recorded, 1.55 feet at 5 p. m. August 8 and 7 a. m. August 9 (discharge, 141 second-feet); minimum discharge, 100 second-feet, March 20 (stage-discharge relation affected by ice).

1909–1917: Maximum stage recorded, 14.8 feet during the night of March 27, 1913, determined by leveling from flood marks (discharge not computed); minimum stage recorded, zero flow at various times when water is being held back by mills.

ICE.—River freezes over at the control; stage-discharge relation seriously affected; ice jams occasionally form below the gage.

REGULATION.—A small diurnal fluctuation is caused by the operation of Pierce's mills, just above the station, and by other mills farther upstream. The effect of the diurnal fluctuation was studied by means of a portable automatic gage from August 16 to September 11, 1914. Although the results obtained from twice-a-day gage heights were found to be occasionally in error for individual days, mean discharge for the period determined from twice-a-day gage heights was found to be identical with that obtained from hourly gage heights.

[illegible]—Stage-discharge relation practically permanent, but many individual discharge measurements show a large percentage of error, probably due to fluctuation in stage during the measurement. Rating curve fairly well defined below [illegible] second-feet. [illegible] Daily discharge ascertained by applying mean daily gage height to rating table with corrections [illegible] during the winter. [illegible]

Discharge measurements of Passumpsic River at Pierce's mills, near St. Johnsbury, Vt., during the year ending Sept. 30, 1917.

WHITE RIVER AT WEST HARTFORD, VT

Location. About 500 feet above highway bridge in West Hartford, Windsor County and 7 miles above mouth of river.

Drainage area.—687 square miles (measured on topographic maps, and Post Route map of Vermont, edition of 1915).

Records available.—June 9, 1915, to September 30, 1917.

Gage.—Inclined staff on left bank; read by F. P. Morse.

Discharge measurements.—Made from cable 1,500 feet below the gage or by wading.

Channel and control.—Channel wide and .of fairly uniform cross section at measuring section. Bed covered with gravel and small boulders. Control formed by rock ledge 100 feet below the gage; well defined.

Extremes of discharge.—Maximum stage recorded during year, 11.1 feet at 6 p. m. June 12 (discharge, by extension of rating curve, about 11,700 second-feet); minimum stage recorded, 2.40 feet at 6 p. m. September 27 (discharge, by extension of rating curve, about 36 second-feet).

1915–1917: Maximum stage recorded June 12, 1917; minimum stage recorded, 2.33 feet at 6 a. m. August 29, 1916 (discharge, by extension of rating curve,[1] about 26 second-feet). The highwater of March 27, 1913, reached a stage of 18.9 feet, as determined from reference point on scale platform opposite gage (discharge not determined).

Ice.—River freezes over at the gage; control usually remains partly open, although ice on the rocks and along the shore affects the stage-discharge relation.

Regulation.—There are several power plants on the main stream and tributaries above the station, the nearest being that of the Vermont Copper Co., at Sharon; when this plant is in operation it causes some diurnal fluctuation in discharge at low stages. The effect of power plants farther upstream is eliminated by the large amount of pondage at Sharon.

Accuracy.—Stage-discharge relation practically permanent except when affected by ice. Rating curve fairly well defined between 150 and 5,000 second-feet. Staff gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good.

[1] Revised, and supersedes minimum published in Water-Supply paper 431.

Monthly discharge of White River at West Hartford, Vt., for the year ending Sept. 30, 1917.

[Drainage area, 687 square miles.]

ASHUELOT RIVER AT HINSDALE, N. H.

Location.—At lower steel highway bridge, about a quarter of a mile below dam of Fisk Paper Co., and 1¼ miles above mouth of river, at Hinsdale, Cheshire County.

Drainage area.—440 square miles.

Records available.—February 22, 1907, to December 31, 1909, and July 11, 1914, to September 30, 1917.

Gage.—Chain gage on downstream side of bridge; read by T. W. Golden.

Discharge measurements.—Made from bridge.

Channel and control.—Bed covered with coarse gravel and boulders. Control is a short distance below gage and is practically permanent.

Extremes of discharge.—Maximum stage recorded during year, 7.25 feet at 4 p. m. March 29 (discharge, from extension of rating curve, about 4,820 second-feet); minimum stage recorded, 2 10 feet at 8 a. m. August 29 (discharge, from extension of rating curve, about 12 second-feet.)

1914–1917.—Maximum stage recorded, 7.5 feet at 5 p. m. February 26, 1915 (discharge, from extension of rating curve, about 5,190 second-feet); minimum stage recorded, 2.0 feet at 4 p. m. October 4, 1914 (discharge, from extension of rating curve, about 10 second-feet).

Ice.—Stage discharge relation affected for short periods by ice which forms below bridge on control.

Regulation.—The mills immediately above station are operated continuously except for Sundays and holidays, but cause little fluctuation in stage. Storage in the mill ponds above affects distribution of flow. The effect of power regulation was studied by a temporary installation of water-stage recorder during July and August, 1917.

Accuracy.—Stage-discharge relation practically permanent except when affected by ice. Rating curve fairly well defined below 4,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good.

Monthly discharge of Ashuelot River at Hinsdale, N. H., for the year ending Sept. 30, 1917.

[Drainage area, 440 square miles.]

MILLERS RIVER NEAR WINCHENDON, MASS.

LOCATION.—At steel highway bridge known locally as Nolan's bridge, half a mile below mouth of Sip Pond Brook and 2 miles west of Winchendon, Worcester County.

DRAINAGE AREA.—80 square miles (measured on topographic maps).

RECORDS AVAILABLE.—June 5, 1916, to September 30, 1917.

GAGE.—Stevens continuous water-stage recorder on right bank just below bridge; installed July 4, 1917. Chain gage on downstream side of bridge June 5, 1916, to February 28, 1917. Foxboro water-stage recorder June 5 to July 3, 1917. Gages read by Arthur Lehman and Franklin Epps.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed covered with gravel and alluvial deposits. Control for low and medium stages is gravel bar about 200 feet below gage; shifts occasionally.

EXTREMES OF DISCHARGE.—Maximum stage during year ending September 30, 1917, occurred during period of unrecorded gage height; minimum stage, from water-stage recorder, 2.60 feet at 8.30 a. m. August 13 (discharge, about 6 second-feet).

1916–17: Maximum stage recorded, 5.53 feet at 6 p. m. June 19, 1916 (discharge about 481 second-feet[1]); minimum stage recorded August 13, 1917.

ICE.—Stage-discharge relation seriously affected by ice. Complete ice cover usually remains intact throughout the winter. Owing to large diurnal fluctuation caused by operation of power plants above, water frequently overflows the ice cover.

REGULATION.—Distribution of flow is affected by operation of power plants at Winchendon and by storage in Lake Monomonac and other reservoirs.

ACCURACY.—Stage-discharge relation subject to changes on account of shifts in low water control; also affected by ice. Rating curve for 1917 is well defined between 20 and 250 second-feet and fairly well defined between 250 and 600 second-feet. Daily gage height June 5, 1916, to February 28, 1917, is mean of two readings per day, to hundredths, on chain gage; gage heights June 5 to July 3, 1917, is mean of 24 gage heights per day from Foxboro water-stage recorder. Daily discharge June 5, 1916, to July 3, 1917, ascertained by applying mean daily gage height to rating table with corrections for ice during the winter; discharge July 4 to September 30, 1917, determined by use of discharge integrator. Records for periods during which water-stage recorders were in operation are good; those for other periods are fair.

[1] Revised determination; supersedes that published in Water-Supply Paper 431.

NOTE.—Determination for 1916 revised by means of data obtained during 1917; supersede those published in Water-Supply Paper 431.

MILLERS RIVER AT ERVING, MASS.

LOCATION.—At downstream end of chair factory at Erving, Franklin County, about 8 miles above confluence of Millers River with Connecticut River and below all important tributaries.

DRAINAGE AREA.—372 square miles (measured on topographic maps).

RECORDS AVAILABLE.—August 1, 1914, to September 30, 1917.

GAGES.—Barrett & Lawrence 7-day hydrochronograph installed February 3, 1916, to replace Barrett & Lawrence gage installed July 1, 1915. Vertical staff attached to downstream end of factory, used August 1, 1914, to July 1, 1915, and at times when hydrochronographs were out of order. All gages at same site and datum; read by C. H. Gary and E. F. Bancroft.

DISCHARGE MEASUREMENTS.—Made from cable near gage or by wading.

CHANNEL AND CONTROL.—Bed covered with coarse gravel and boulders. Control is a short distance below the gage and is practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage during year, from water-stage recorder, 5.32 feet at 6 p. m. March 28 (discharge, 4,820 second-feet); minimum stage, from water-stage recorder, 0.87 foot at 3.30 p. m. October 29 (discharge practically zero).

1914–1917: Maximum stage recorded, 5.6 feet at 4 p. m. February 25, 1915 (discharge, 5,160 second-feet [1]); minimum discharge, practically zero at various times during 1915, and at 3.30 p. m. October 29, 1916, when water was held back by dams above the gage.

ICE.—River freezes over below the gage at various times during the winter; ice considerably broken by rising and falling stages due to operation of power-plants.

REGULATION.—Distribution of flow affected by operation of various power plants and storage reservoirs above the station.

---

NOTE.—Determination for 1916 revised by means of data [illegible] published in Water-Supply Paper 431.

MILLERS RIVER AT ERVING, MASS.

LOCATION.—At downstream end of chair factory at Erving, [illegible] 8 miles above confluence of Millers River with Connecticut River [illegible] important tributaries.

DRAINAGE AREA.—372 square miles (measured on topographic map).

RECORDS AVAILABLE.—August 1, 1914, to September 30, [illegible] of

GAGES.—Barrett & Lawrence 7-day hydrochronograph [illegible] ed. to replace Barrett & Lawrence gage installed [illegible] stage to downstream end of factory, used August [illegible] when hydrochronographs were out of order. [illegible] clearly de- read by C. H. Gary and E. F. Bancroft. [illegible] d staff gage

DISCHARGE MEASUREMENTS.—Made from [illegible]

CHANNEL AND CONTROL.—Bed covered with [illegible], 5.21 feet (on in- [illegible] ance below the gage [illegible] of rating curve, 294

EXTREMES OF DISCHARGE.—Maximum stage [illegible] occurred February 18, [illegible] 6 p. m. March 28 (discharge, [illegible] minimum open-water dis- [illegible] stage recorder, 0.8[illegible] [illegible], inclined gage, 2.01 feet).

[illegible] 17; minimum stage, from water- [illegible] 17: Maximum stage [illegible], 1916 (discharge, from extension [illegible] 5,160 second-feet [illegible] ring 1915, and at [illegible] rably affected by operation of mills at [illegible] above the gage [illegible] rly Pond and Sip Pond.

[illegible] freezes over [illegible] occasionally at lower gage but appar- [illegible] ly broken by [illegible] urves used to June 26 fairly well defined [illegible] June 27 to September 30, well defined

[illegible] ON.—Distribution [illegible] ned staff read to hundredths twice daily. [illegible] reservoirs [illegible] rs satisfactory. Daily discharge October 1 [illegible] ying mean daily gage height from water-stage [illegible] r 13 to June 26, by applying to rating table [illegible] nclined gage with corrections for ice during the [illegible], by use of discharge integrator. Records good.

[1] Super[illegible]

ACCURACY.—Stage-discharge relation practically permanent except when affected by ice. Rating curve well defined below 4,000 second-feet. Staff gage read to hundredths twice daily. Daily discharge ascertained by use of discharge integrator except for periods when continuous gage-height record was not obtained. For these periods the staff gage records were used with corrections as determined by various comparisons with the water-stage recorder. Records good except for times of ice effect, for which they are fair.

Discharge measurements of Millers River at Erving, Mass., during the year ending Sept. 30, 1917.

SIP POND BROOK NEAR WINCHENDON, MASS.

Location.—About 500 feet above highway bridge, a quarter of a mile below Massachusetts-New Hampshire State line, 1½ miles below outlet of Sip Pond, and 3 miles northwest of Winchendon, Worcester County.

Drainage area.—18.8 square miles (measured on topographic maps).

Records available.—May 29, 1916, to September 30, 1917.

Gages.—Gurley 7-day water-stage recorder, installed June 26, 1917, and vertical staff gage installed June 9, 1917, on left bank 500 feet above highway bridge. Inclined staff gage on right bank 50 feet above highway bridge used May 29 to June 29 and December 13, 1916, to June 26, 1917; Stevens 8-day water-stage recorder at same site and datum used June 30 to December 12, 1916. Gages read by W. G. Greenall and Hazel Greenall. All gages at same datum but owing to slope of stream readings on present gage are higher than those on gages previously used.

Discharge measurements.—Made from footbridge 15 feet below Gurley water-stage recorder or by wading.

Channel and control.—Bed rough; covered with boulders. Control clearly defined. Considerable aquatic vegetation in channel below inclined staff gage during summer months.

Extremes of discharge.—Maximum stage recorded during year, 5.21 feet (on inclined gage) at 6 p. m. March 28 (discharge, from extension of rating curve, 294 second-feet); minimum discharge, about 6 second-feet, occurred February 18, when stage-discharge relation was affected by ice; minimum open-water discharge, 7.2 second-feet at 7 a. m. October 28 (stage, inclined gage, 2.01 feet).

1916–17: Maximum stage recorded March 28, 1917; minimum stage, from water-stage recorder, 1.88 feet at 7 a. m. September 15, 1916 (discharge, from extension of rating curve, 5 second-feet).

Regulation.—Distribution of flow is considerably affected by operation of mills at State Line, N. H., and by storage in Pearly Pond and Sip Pond.

Accuracy.—Stage-discharge relation changed occasionally at lower gage but apparently permanent at upper one. Rating curves used to June 26 fairly well defined between 9 and 130 second-feet; from June 27 to September 30, well defined between 9 and 100 second-feet. Inclined staff read to hundredths twice daily. Operation of both water-stage recorders satisfactory. Daily discharge October 1 to December 12 ascertained by applying mean daily gage height from water-stage recorder to rating table; December 13 to June 26, by applying to rating table mean of two readings per day on inclined gage with corrections for ice during the winter; June 27 to September 30, by use of discharge integrator. Records good.

Discharge measurements of Sip Pond Brook near Winchendon, Mass., during the year ending Sept. 30, 1917.

PRIEST BROOK NEAR WINCHENDON, MASS.

ᴏᴄᴀᴛɪᴏɴ.—At highway bridge 3 miles above confluence of Priest Brook with Millers River and 3½ miles west of Winchendon, Worcester County.

ʀᴀɪɴᴀɢᴇ ᴀʀᴇᴀ.—18.8 square miles (measured on topographic maps).

ʀᴇᴄᴏʀᴅs ᴀᴠᴀɪʟᴀʙʟᴇ.—May 25, 1916, to September 30, 1917.

ᴀɢᴇ.—Sloping staff on left bank 200 feet below highway bridge; read by R. D. Hutchinson.

ɪsᴄʜᴀʀɢᴇ ᴍᴇᴀsᴜʀᴇᴍᴇɴᴛs.—Made from highway bridge or by wading.

ʜᴀɴɴᴇʟ ᴀɴᴅ ᴄᴏɴᴛʀᴏʟ.—Channel above station is straight; section fairly uniform; gravel bottom. Control formed by the foundation of an old dam 30 feet below gage; permanent.

Exᴛʀᴇᴍᴇs ᴏғ ᴅɪsᴄʜᴀʀɢᴇ.—1916–17: Maximum stage recorded, 4.88 feet at 7 a. m. March 28 and 29, 1917 (discharge, 306 second-feet); minimum stage recorded, 2.30 feet several times in August, 1917 (discharge, by extension of rating curve, about 1.5 second-feet).

Iᴄᴇ.—Brook freezes over at gage, and on control; stage-discharge relation somewhat affected.

Rᴇɢᴜʟᴀᴛɪᴏɴ.—Flow not appreciably affected by regulation.

Aᴄᴄᴜʀᴀᴄʏ.—Stage-discharge relation practically permanent, except when affected by ice. Rating curve well defined between 2 and 180 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good.

Discharge measurements of Priest Brook near Winchendon, Mass., during the year ending Sept. 30, 1917.

NOTE.—Determinations for 1916 revised by means of data obtained during 1917; supersede those published in Water Supply-Paper 431.

OTTER RIVER NEAR GARDNER, MASS.

LOCATION.—At concrete arch bridge just above outlet of Wilder and Kneeland brooks, about a mile west of Gardner, Worcester County.

DRAINAGE AREA.—20 square miles (measured on topographic maps).

RECORDS AVAILABLE.—June 28, 1916, to September 30, 1917, when station was discontinued.

GAGE.—Vertical staff bolted to downstream side of right abutment of highway bridge; read by Alfred Cavalier.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Growth of aquatic vegetation in channel during summer months seriously affects stage-discharge relation.

EXTREMES OF DISCHARGE: Maximum stage during periods covered by records, 3.60 feet at 6 p. m. March 28, 1917 (discharge, 189 second-feet); minimum stage recorded, about −0.4 foot several times in October, 1917 (discharge not determined).

ICE.—Stage-discharge relation seriously affected by ice; river freezes over.

REGULATION.—Operation of a filter plant a quarter of a mile above the gage causes occasional fluctuations in discharge.

ACCURACY.—Stage-discharge relation seriously affected by ice and by aquatic vegetation. Frequent discharge measurements required. Standard rating curve fairly well defined. Gage read to hundredths twice daily. Daily discharge determined by shifting-control method, adjusted gage heights being applied to rating table for standard curve. Records fair.

[illegible] River near Gardner, Mass., during the year ending Sept. 30, 1917.

EAST BRANCH OF TULLY RIVER NEAR ATHOL, MASS.

LOCATION.—At highway bridge half a mile below mouth of Lawrence Brook and 3½ miles north of Athol, Worcester County.

DRAINAGE AREA.—50.2 square miles (measured on topographic maps).

RECORDS AVAILABLE.—June 13, 1916, to September 30, 1917.

GAGE.—Vertical staff on downstream side of right abutment; read by W. A. Thompson.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

CHANNEL AND CONTROL.—Two channels under bridge, one channel above; about 200 feet below the gage the channel is divided by an island. Control sections are formed by rocks and boulders in the two channels; probably permanent.

EXTREMES OF DISCHARGE.—1916–17: Maximum stage recorded, 3.76 feet at 1 p. m. March 28, 1917 (discharge, 780 second-feet); minimum stage recorded, 0.30 foot at 6 p. m. August 8 and 7 a. m. August 9, 1917 (discharge, 6.0 second-feet).

ICE.—Ice forms along banks; stage-discharge relation affected for short periods.

DIVERSIONS.—About half a mile below station water is diverted through a canal into Packard Pond; a discharge measurement made June 14, 1917, showed 13.0 second-feet diverted through canal.

REGULATION.—Flow not seriously affected by regulation.

ACCURACY.—Stage-discharge relation permanent except for short periods when affected by ice. Rating curve well defined between 10 and 300 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good.

Discharge measurements of East Branch of Tully River near Athol, Mass., during the year ending Sept. 30, 1917.

NOTE.—Record for 1916 revised by means of data obtained in 1917, and supersedes that published in Water-Supply Paper 431.

MOSS BROOK AT WENDELL DEPOT, MASS.

LOCATION.—About a quarter of a mile above confluence with Millers River and a quarter of a mile from Wendell Depot, Franklin County.

DRAINAGE AREA.—12.2 square miles (measured on topographic maps).

RECORDS AVAILABLE.—June 7, 1916, to September 30, 1917. From June 4 to October 16, 1909, records were obtained at a station near the mouth of the stream, and from April 25 to August 27, 1910, at a weir a short distance below the present site.

GAGE.—Sloping staff on left bank; read by C. M. Porter.

DISCHARGE MEASUREMENTS.—Made by wading.

CHANNEL AND CONTROL.—Bed composed principally of ledge rock and boulders. Control permanent.

EXTREMES OF DISCHARGE.—1916-17: Maximum stage recorded during the year, 3.52 feet at 12.45 p. m. March 28, 1917 (discharge, by extension of rating curve, about 187 second-feet); minimum stage recorded, 0.86 foot at 7.30 a. m., August 29, 1917 (discharge, by extension of rating curve, about 0.6 second-foot).

ICE.—Stage-discharge relation slightly affected by ice for short periods.

REGULATION.—Flow not affected by regulation.

ACCURACY.—Stage-discharge relation permanent, except when affected by ice. Rating curve well defined between 2 and 20 second-feet and fairly well defined between 20 and 60 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table with corrections for ice during the winter. Records good.

Discharge measurements of Moss Brook at Wendell Depot, Mass., during the year ending Sept. 30, 1917.

DEERFIELD RIVER AT CHARLEMONT, MASS.

LOCATION.—1 mile below village of Charlemont, Franklin County.

DRAINAGE AREA.—362 square miles (measured on topographic maps).

RECORDS AVAILABLE.—June 19, 1913, to September 30, 1917.

GAGES.—Friez water-stage recorder on left bank, referred to gage datum by a hook gage inside the well; an outside sloping staff gage is used for auxiliary readings.

DISCHARGE MEASUREMENTS.—Made from cable or by wading.

CHANNEL AND CONTROL.—Bed covered with coarse gravel and boulders; section fairly uniform. Control practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage during year, from water-stage recorder, 7.53 feet at 10.30 p. m. April 21 (discharge, 9,760 second-feet); minimum stage during year, from water-stage recorder, 1.41 feet at 10 a. m. August 7 (discharge, 34 second-feet).

1913–1917: Maximum stage recorded, 15.7 feet on July 8, 1915 (discharge by extension of rating curve, about 45,000 second-feet); minimum stage recorded, 1.35 feet on September 21 and November 3, 1914 (discharge, 23 second-feet).

ICE.—River is usually frozen over during the greater part of the winter; ice jams occasionally form below the gage causing several feet of backwater.

REGULATION.—Flow during low and medium stages largely regulated by a storage reservoir at Somerset, Vt. Several power plants above the station cause diurnal fluctuation.

ACCURACY.—Stage-discharge relation practically permanent except as affected by ice. Rating curve well defined. Operation of the water-stage recorder satisfactory except for short periods as shown in the footnote to the daily-discharge table. Daily discharge ascertained by use of discharge integrator. Records excellent.

Discharge measurements of Deerfield River at Charlemont, Mass., during the year ending Sept. 30, 1917.

Note.—The increase (+) or decrease (−) of water held in storage at Somerset, Vt., during the month [illegible] been computed by engineers of the Geological Survey from data of storage increase or decrease furnished [illegible] the company operating the reservoir.

WARE RIVER AT GIBBS CROSSING, MASS.

[LOCATIO]N.—Between highway and electric-railway bridges at Gibbs Crossing, about [thr]ee-quarters of a mile above mouth of Beaver Brook and 3 miles below Ware, [Ha]mpshire County.

[DRAINA]GE AREA.—201 square miles (measured on topographic maps).

[RECOR]DS AVAILABLE.—August 20, 1912, to September 30, 1917.

[GAGE].—Barrett & Lawrence water-stage recorder on the right bank; referred to gage [da]tum by a hook gage inside of well; inclined staff gage used for auxiliary [re]adings.

[DISCH]ARGE MEASUREMENTS.—Made from the electric railway bridge or by wading.

[CHAN]NEL AND CONTROL.—Bed rough; subject to aquatic vegetation during summer [m]onths. Control free from weeds and at ordinary stages well defined at a [s]ection near the gage; at high stages the control is probably at the dam at Thorndike, 4 miles below the gage.

[EXT]REMES OF DISCHARGE.—Maximum stage during year, from water-stage recorder, [5].25 feet at 6 p. m. March 28 (discharge, 2,430 second-feet); a stage of 6.0 feet was recorded at 10 a. m. February 27, but the water was held back by an ice jam; minimum stage during year, from water-stage recorder, 1.45 feet at 4 p. m. September 30 (discharge, 21 second-feet).

1912–1917: Maximum open-water stage recorded, 5.9 feet on March 2, 1914 (discharge, 2,770 second-feet); minimum stage recorded, 1.20 feet on October 26, 1914 (discharge, 5 second-feet).

[IC]E.—River usually freezes over, and the stage-discharge relation is seriously affected by the ice; the large diurnal fluctuation in flow causes a variable backwater effect.

[RE]GULATION.—Flow affected by operation of mills at Ware, which at low stages causes a large variation in discharge on days when the mills are in operation, and a low discharge on Sundays and holidays.

[A]CCURACY.—Stage-discharge relation practically permanent except, when affected by ice. Rating curve well defined. Operation of water-stage recorder satisfactory, except for short periods as shown in footnote to daily-discharge table. Daily discharge ascertained by use of discharge integrator. Records good.

Discharge measurements of Ware River at Gibbs Crossing, Mass., during the year ending Sept. 30, 1917.

[a] Stage-discharge relation affected by ice.

SWIFT RIVER AT WEST WARE, MASS.

LOCATION.—About 1,000 feet below old wooden dam opposite West Ware station of Boston & Albany Railroad, 6 miles downstream from Enfield, Hampshire County, and 3 miles below confluence of East and West branches of Swift River.

DRAINAGE AREA.—186 square miles (measured on topographic maps).

RECORDS AVAILABLE.—July 15, 1910, to September 30, 1917.

GAGES.—Barrett & Lawrence water-stage recorder on left bank, referred to gage datum by means of a hook gage inside the well; an inclined staff gage is used for auxiliary readings. Prior to August 25, 1912, a chain gage on foot bridge 600 feet upstream from the present station.

DISCHARGE MEASUREMENTS.—Made from cable or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel and alluvial deposits; some aquatic vegetation in channel during summer. Control practically permanent after change during high water of April 3, 1916, when part of dam was destroyed; at high stages, the control is probably at the dam at Bondsville, 4 miles below the gage.

EXTREMES OF DISCHARGE.—Maximum stage during year, from water-stage recorder, 7.9 feet some time between March 23 and April 1 (discharge, 1,800 second-feet); minimum stage during year, from water-stage recorder, 1.87 feet at 8 a. m. August 9 (discharge, 67 second-feet).

1910–1917: Maximum stage recorded, 9.1 feet on February 26, 1915 (discharge, by extension of rating curve, 2,240 second-feet); minimum stage recorded, 1.36 feet on September 22, 1914 (discharge, 22 second-feet).

ICE.—River usually freezes over; stage-discharge relation somewhat affected by ice.

REGULATION.—Operation of mills at Enfield, 6 miles above the station, affects distribution of flow at low and medium stages, but has only a slight effect when the mean daily discharge exceeds 200 second-feet.

ACCURACY.—Stage-discharge relation practically permanent, except for a change during high water April 3, 1916, caused by the washing out of a portion of an old timber dam just above the station. Rating curve fairly well defined below 1,200 second-feet. Daily discharge ascertained by applying to rating table mean daily gage height determined by inspecting gage-height graph or, for days of considerable fluctuation, by averaging the mean gage heights of 4-hour periods with corrections for ice during the winter. Records December 12, 1916, to March 25, 1917, only fair; good for remainder of year.

Discharge measurements of Swift River at West Ware, Mass., during the year ending Sept. 30, 1917.

WESTFIELD RIVER AT KNIGHTVILLE, MASS.

LOCATION.—At single-span steel highway bridge known locally as Pitcher Bridge, in Knightville, Hampshire County, 1 mile north of outlet of Norwich Lake, and about 3 miles above confluence with Middle Branch of Westfield River.

DRAINAGE AREA.—162 square miles (measured on topographic maps).

RECORDS AVAILABLE.—August 2[illegible], 1909, to September 30, 1917.

GAGE.—Chain attached to downstream side of highway bridge; read by J. A. Burr.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

CHANNEL AND CONTROL.—Channel rough, composed of boulders and ledge rock; control practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.8 feet at 7 a. m. March 28 (discharge, 3,030 second-feet); minimum stage recorded, 0.81 foot several times in September (discharge, 16 second-feet).

1909–1917: Maximum open-water stage recorded, 8.9 feet on March 27, 1913 (discharge by extension of rating curve, about 5,100 second-feet); a gage height of 9.4 feet was recorded at 9.15 a. m. January 22, 1910, but channel was probably obstructed by ice at that time; minimum stage recorded, 0.60 foot on August 10, 1913 (discharge, 4 second-feet).

ICE.—Ice usually forms in the river early in the winter and seriously affects the stage-discharge relation.

REGULATION.—Flow not seriously affected by regulation.

ACCURACY.—The stage-discharge relation has probably remained permanent, except during ice periods, although individual discharge measurements have at times appeared erratic; the rough and irregular channel causes difficulty in obtaining accurate discharge measurements. Rating curve fairly well defined below 2,000 second-feet. Gage read to hundredths twice daily, except during the winter, when it was read once daily. Daily discharge ascertained by applying mean daily gage heights to rating table with corrections for ice during the winter. Records good.

Discharge measurements of Westfield River at Knightville, Mass., during the year ending Sept. 30, 1917.

NOTE.—Stage-discharge relation affected by ice Feb. 1-26; discharge determined from study of gage-height graph, one discharge measurement, weather records, and comparison with similar study for Westfield River at Knightville. No gage-height record Apr. 6-7, May 28-31, June 1-2, and 17-23; discharge estimated.

ACCURACY.—Stage-discharge relation changed during high water in March, 1917; seriously affected by ice from December to March. Rating curve used to March 24, 1917, well defined below 400 second-feet by discharge measurements and is very nearly parallel to preceding curve; above 400 second-feet the new curve was extended as a parallel curve; rating curve used March 24 to September 30, fairly well defined by discharge measurements up to 1,000 second-feet. Operation of water-stage recorders not entirely satisfactory. Daily discharge ascertained by applying to rating table mean daily gage height determined by inspecting recorder graph, except for periods as noted in footnote to daily discharge table. Records fair.

Discharge measurements of Middle Branch of Westfield River at Goss Heights, Mass., during the year ending Sept. 30, 1917.

WESTFIELD LITTLE RIVER NEAR WESTFIELD, MASS.

LOCATION.—At diversion dam of Springfield waterworks, in town of Russell, Hampden County, 3 miles below confluence of Pebble and Borden brooks and about 3 miles west of Westfield. Originally (July, 1905, to December, 1909) a short distance below Borden Brook, near Cobble Mountain.

DRAINAGE AREA.—43 square miles at original site; 48 square miles at present site.

RECORDS AVAILABLE.—July 13, 1905, to September 30, 1917.

DETERMINATION OF DISCHARGE.—At the original site below Borden Brook (used 1905–1909) the discharge was determined by methods commonly employed at current-meter gaging stations. From August, 1906, to September, 1907, a 30-foot weir was maintained a short distance below the gage.[1]

Since March 1, 1910, high-water flow determined from continuous records of head on concrete diversion dam (crest length, 155.4 feet), for which coefficients have been deduced from experiments at Cornell University; low-water flow, less than 163 second-feet, determined from continuous record of head on a 12-foot sharp-crested weir without end contractions, the crest being 2.55 feet below that of the dam. Water diverted to city of Springfield is measured by a 54-inch Venturi meter, using continuous record chart. Daily record corrected for storages in a reservoir on Borden Brook about 5 miles above station, but owing to the time required for water to reach the dam and the natural storage along the stream the record as corrected does not represent exactly the natural flow of the stream at all times.

EXTREMES OF DISCHARGE.—Maximum discharge for 24 hours recorded during year, 880 second-feet, March 27; minimum discharge for 24 hours recorded, 1.2 second-feet, October 16.

1909–1917: Maximum discharge for 24 hours, 1,490 second-feet, March 28, 1914; minimum discharge apparently zero at various times when the water released from the reservoir was equal to or greater than the total flow at the diversion dam.

DIVERSIONS.—Record of water diverted at station for municipal supply of Springfield included in records as published.

COOPERATION.—Data collected and compiled under the direction of E. E. Lochridge, chief engineer, board of water commissioners, Springfield, Mass.

[1] Results obtained by weir and current-meter methods are compared in U. S. Geol. Survey Water-Supply Papers 201, pp. 105–110, and 241, pp. 164–168.

Daily discharge, in second-feet, of Westfield Little River near Westfield, Mass., for the year ending Sept. 30, 1917.

BORDEN BROOK NEAR WESTFIELD, MASS.

Location.—At outlet of Borden Brook reservoir in town of Granville, [illegible] miles above [illegible] and about [illegible] miles west of Westfield.

Drainage area.—[illegible] square miles.

Records available.—[illegible] to September 30, 1917.

Determination of discharge.—Flow determined from a continuous record of the head on a [illegible] sharp-crested weir without end contractions. The results are then corrected for the apparent gain or loss in storage water in the reservoir but [illegible] is made for evaporation.

Extremes of discharge.—Maximum 24-hour flow recorded during year, [illegible] second-feet [illegible]; minimum apparent flow [illegible] second-feet at various times when the apparent storage increase was equal to or greater than the measured flow at the weir.

[illegible]: Maximum 24-hour flow recorded, [illegible] second-feet [illegible]; minimum apparent flow, [illegible] second-feet.

Cooperation.—Records furnished by the board of water commissioners of Springfield through [illegible], chief engineer.

Daily discharge, in second-feet, of Borden Brook near Westfield, Mass., for the year ending [illegible]

Day	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

Note.—The figures [illegible] by subtracting from the quantity of water running over the weir the [illegible] amount apparently stored in the reservoir [illegible] allowance has been made for evaporation [illegible] flow at the outlet of the reservoir [illegible] the amount apparently resulting from storage was equal to or greater than the amount passing over the weir.

Monthly discharge of Borden Brook near Westfield, Mass., for the year ending Sept. 30, 1917.

[Drainage area, 8 square miles.]

NOTE.—For months for which no minimum is given, see footnote to daily discharge table.

FARMINGTON RIVER NEAR NEW BOSTON, MASS.

LOCATION.—At highway bridge a quarter of a mile below Clam River and about 1 mile south of New Boston, Berskhire County.

DRAINAGE AREA.—92.7 square miles (measured on topographic maps).

RECORDS AVAILABLE.—May 27, 1913, to September 30, 1917.

GAGES.—Barrett & Lawrence water-stage recorder on left bank, downstream side of bridge, referred to gage datum by a hook gage inside the well. Vertical staff on bridge abutment is used for auxiliary readings.

DISCHARGE MEASUREMENTS.—Made from from a cable or by wading.

CHANNEL AND CONTROL.—Bed rocky, covered with boulders. Control practically permanent except as affected by removal of rocks in measuring section.

EXTREMES OF DISCHARGE.—Maximum open-water stage during year, from water-stage recorder, 6.5 feet at 11 p. m. March 27 (discharge, 1,900 second-feet); a stage of 7.9 feet was recorded at 4 p. m. January 14, but the water was held back by an ice jam; minimum stage during year, from water-stage recorder, 2.54 feet at 4 a. m. September 6 (discharge, 18 second-feet).

1913–1917: Maximum open-water stage from water-stage recorder, 7.64 feet on October 26, 1913 (discharge, by extension of rating curve, about 3,200 second-feet); minimum stage from water-stage recorder, 2.22 feet on August 27, 1913 (discharge, 4.4 second-feet).

ICE.—River usually frozen over during greater part of winter; stage-discharge relation seriously affected. Ice jams occasionally form below the gage, causing several feet of backwater.

REGULATION.—Flow affected by storage in Otis reservoir, about 5 miles above New Boston, and by operation of a woodworking shop using water power just above the station.

ACCURACY.—Stage-discharge relation practically permanent except when affected by ice. Rating curve well defined below 1,700 second-feet. Operation of water-stage recorder satisfactory except for short periods as shown in footnote to daily-discharge table. Daily discharge ascertained by applying to rating table mean daily gage height determined by inspecting gage height graph, or, for days of considerable fluctuation, by averaging the means of 4-hour periods. Winter records only fair; those for open-water periods good.

The following discharge measurement was made by H. H. Khachadoorian:

January 26, 1917: Gage height, 6.14 feet; discharge, 170 second-feet; stage-discharge relation affected by ice.

Daily discharge, in second-feet, of Farmington River near New Boston, Mass., for the year ending Sept. 30, 1917.

Day.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.

HOUSATONIC RIVER BASIN.

HOUSATONIC RIVER NEAR GREAT BARRINGTON, MASS.

LOCATION.—At highway bridge about a quarter of a mile northeast of Van Deusenville station of New York, New Haven & Hartford Railroad (Berkshire division) and 2 miles north of Great Barrington, Berkshire County.

DRAINAGE AREA.—280 square miles (measured on topographic maps).

RECORDS AVAILABLE.—May 17, 1913, to September 30, 1917.

GAGE.—Inclined staff attached to concrete anchorages on downstream side of left abutment of highway bridge; vertical high-water section attached to bridge abutment; read by Martin Love.

DISCHARGE MEASUREMENTS.—Made from upstream side of highway bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of sand and gravel; control practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.9 feet from 8.30 a. m. March 28 to 8.30 a. m. March 29 (discharge, 4,200 second-feet); minimum stage recorded, 0.7 foot at 8 a. m. September 27 (discharge, 13 second-feet).

1913–1917: Maximum stage recorded, 8.0 feet on March 31, 1916 (discharge from extension of rating curve, about 5,300 second-feet). Zero flow recorded at various times caused by storage of water at dams above.

ICE.—Stage-discharge relation occasionally affected by ice for short periods during the winter.

REGULATION.—Storage above dam of a paper mill about a mile above station causes low flow on Sundays and holidays.

ACCURACY.—Stage-discharge relation practically permanent since change during the high water of December 1, 1916; affected by ice for a few days in February. Rating curve used to November 30, fairly well defined by discharge measurements below 1,400 second-feet and by shape of old curve; rating curve used from December 1 to September 30 well defined below 2,000 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records fair.

Discharge measurements of Housatonic River near Great Barrington, Mass., during the year ending Sept. 30, 1917.

HOUSATONIC RIVER AT FALLS VILLAGE, CONN.

Location.—About half a mile below power plant of Connecticut Power Co. at Falls Village, Litchfield County, 23 miles north of Gaylordsville.

Drainage area.—644 square miles (authority, Stone & Webster).

Records available.—July 11, 1912, to September 30, 1917.

Gages.—Stevens continuous water-stage recorder on left bank; staff and hook gages inside the well and vertical staff on river bank 25 feet upstream; chain gage 300 feet upstream used for auxiliary readings.

Discharge measurements.—Made by wading or from cable installed October 18, 1916, 150 feet above gage.

Channel and control.—Channel deep and fairly uniform in cross-section; one channel at all stages. Control not clearly defined except at low stages; probably permanent.

Extremes of discharge.—Maximum stage during year, from water-stage recorder, 10.40 feet at 10 a. m. March 29 (discharge, 6,000 second-feet); minimum stage, from water-stage recorder, 0.28 foot at 6.30 p. m. October 15 (discharge, practically zero).

1912–1917: Maximum stage recorded, 13.3 feet on March 29, 1914 (discharge, 8,830 second-feet); minimum stage recorded, zero flow at various times owing to storage of water above power plant.

Ice.—Stage-discharge relation seriously affected by ice.

Regulation.—Low-water flow completely regulated by the power plant at Falls Village.

Accuracy.—Stage-discharge relation practically permanent, except when affected by ice. Rating curve for chain gage well defined between 200 and 3,000 second-feet; above 3,000 second-feet, curve is extended by logarithmic plotting, using results of 3 float measurements made between gage heights 12 and 13 feet; rating table for gage heights from water-stage recorder derived from chain gage rating curve by applying correction for slope between the two gages. Operation of water-stage recorder satisfactory. Daily discharge ascertained by use of discharge integrator. Records excellent.

Cooperation.—All discharge measurements and computations prior to March 1, 1916, furnished by Stone & Webster.

Discharge measurements of Housatonic River at Falls Village, Conn., during the year ending Sept. 30, 1017.

HOUSATONIC RIVER AT FALLS VILLAGE, CONN.

Location.—About half a mile below power plant of [illegible] Falls Village, Litchfield County, 23 miles north of [illegible]

Drainage area.—644 square miles (authority, Stone & [illegible]

Records available.—July 11, 1912, to September 30, 1917.

Gages.—Stevens continuous water-stage recorder on left bank [illegible] inside the well and vertical staff on river bank 25 feet [illegible] feet upstream used for auxiliary readings.

Discharge measurements.—Made by wading or from cable [illegible] 1916, 150 feet above gage.

Channel and control.—Channel deep and fairly uniform [illegible] channel at all stages. Control not clearly defined [illegible] permanent.

Extremes of discharge.—Maximum stage during year [illegible] 10.40 feet at 10 a. m. March 29 (discharge, 6,000 second-feet) [illegible] water-stage recorder, 0.28 foot at 6.30 p. m. October 15 [illegible]

1912–1917: Maximum stage recorded, [illegible] 8,830 second-feet); minimum stage recorded [illegible] storage of water above power plant.

Ice.—Stage-discharge relation seriously affected by ice. [illegible]

Regulation.—Low-water flow completely regulated [illegible] Village. [illegible] ion,

Accuracy.—Stage-discharge relation practically permanent [illegible] ice. Rating curve for chain gage well defined [illegible] evious feet; above 3,000 second-feet, curve is extended [illegible] parallel results of 3 float measurements made [illegible] in winter, table for gage heights from water-stage recorder [illegible] plying mean curve by applying correction for slope [illegible] water-stage recorder satisfactory. Daily discharge [illegible] charge integrator. Records excellent.

Cooperation.—All discharge measurements [illegible] furnished by Stone & Webster.

HUDSON RIVER BASIN.

HUDSON RIVER NEAR INDIAN LAKE, N. Y.

LOCATION.—About a mile below mouth of Cedar River, 1½ miles above mouth of Indian River and 4 miles northeast of Indian Lake village, Hamilton County.

DRAINAGE AREA.—4[illegible]3 square miles (measured on topographic maps).

RECORDS AVAILABLE.—August 20, 1916, to September 30, 1917.

GAGE.—Gurley printing water stage recorder on right bank. Inspected by John A. Bolton.

DISCHARGE MEASUREMENTS.—Made by wading or from cable about 100 yards below gage.

CHANNEL AND CONTROL.—Solid ledge overlain with coarse gravel; probably permanent.

EXTREMES OF DISCHARGE.—Maximum stage during year, from water stage recorder, 9.57 feet at 11 a. m. June 12 (discharge, 13,500 second-feet); minimum stage from water stage recorder, 1.62 feet from 10 a. m. to 10 p. m. October 13 (discharge 100 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Large diurnal fluctuation due to logging operations during spring months. Seasonal distribution of flow slightly affected by storage.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice from December to April and by backwater from logs June to September. Rating curve fairly well defined between 75 and 600 second-feet and well defined between 600 and 6,000 second-feet. Operation of water stage recorder satisfactory. Daily discharge ascertained by applying mean daily gage height to rating table except when fluctuation required mean of hourly discharge. Records good.

Discharge measurements of Hudson River near Indian Lake, N. Y., during the year ending Sept. 30, 1917.

HUDSON RIVER AT THURMAN, N. Y.

Location.—At Delaware & Hudson Railroad bridge near Thurman railroad station, Warren County, [illegible] a mile below mouth of Schroon River and 13 miles [illegible] of Sacandaga River.

Drainage area.—[illegible] square miles.

Records available.—September 1, 1907, to September 30, 1913.

Gage.—[illegible] on downstream side [illegible] read by S. H. Spencer.

Discharge measurements.—Made from downstream side of bridge.

Channel and control.—Bed composed of sand and gravel; fairly permanent.

Extremes of discharge.—Maximum stage recorded during year, 9.45 feet, about [illegible] m. June [illegible]; discharge, [illegible] second-feet; minimum stage recorded, 2.06 feet, about 7 a. m., November [illegible]; discharge about [illegible] second-feet.

1907–1913: Maximum stage, [illegible] feet, during the evening, March [illegible], 1913, determined by leveling from flood marks; discharge about [illegible],000 second-feet; minimum stage recorded, [illegible] feet, at [illegible] a. m. and [illegible] p. m., September 30, 1913; discharge about [illegible] second-feet.

Ice.—Stage-discharge relation seriously affected by ice. Winter discharge determined from records at North Creek and Riverbank.

Regulation.—Discharge is regulated to some extent by the storage reservoirs at Indian Lake and Schroon Lake and the mills on the Schroon River.

Accuracy.—Stage-discharge relation practically permanent; affected by ice during some part of the period from December to March, inclusive. Rating curve well defined between [illegible] and [illegible],000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good. Estimated discharge during ice period fair.

Cooperation.—Gage heights furnished by the International Paper Co.

Discharge measurements of Hudson River at Thurman, N. Y., during the year ending September 30, 1913.

The year	22,600	515	2,710	1.75	23.67

NOTE.—Mean discharge for January, February, and March estimated, because of ice, from sum of flow at North Creek and Riverbank plus an estimated inflow. No correction has been made in this table for storage.

HUDSON RIVER AT SPIER FALLS, N. Y.

Location.—Half a mile below Spier Falls dam, Saratoga County, and 11½ miles below mouth of Sacandaga River.

Drainage area.—2,800 square miles (measured on topographic maps).

Records available.—October 7, 1912, to June 30, 1917.

Gage.—Gurley 2-day water stage recorder in brick shelter on the right bank. Recorder inspected by T. F. Malone, chief operator of power plant.

Discharge measurements.—Made from a cable about 1,000 feet downstream from the gage.

Channel and control.—Bed composed of coarse gravel and boulders. Control probably permanent.

Extremes of discharge.—Maximum stage during year, from water stage recorder, 12.82 feet, at 8.30 p. m. June 12 (discharge, 38,100 second-feet); minimum stage, minus 0.12 feet, at 4 p. m. September 23, observed during current meter measurement (discharge about 5.5 second-feet).

1912–1917: Maximum stage, from water stage recorder, 18.59 feet, at 12.25 a. m. March 28, 1913 (discharge about 89,100 second-feet); minimum stage, September 23, 1917.

Ice.—Stage-discharge relation not affected by ice except for a short time during extremely cold periods.

Regulation.—Large diurnal fluctuation in discharge due to operation of the Spier Falls power plant. Seasonal flow affected by storage at Indian Lake and many small lakes and reservoirs in the upper part of the drainage basin.

Accuracy.—Stage-discharge relation practically permanent; affected by ice February 2 to 16. Rating curve well defined for all stages except about 9 feet (discharge 19,900 second-feet), where curve may be 4 per cent or 5 per cent large. Operation of the water stage recorder satisfactory throughout the year. Daily discharge ascertained by averaging the results obtained by applying gage heights for one-hour intervals to the rating table. Records good.

Cooperation.—Water stage recorder inspected by an employee of the Adirondack Electric Power Corporation.

Discharge measurements of Hudson River at Spier Falls, N. Y., during the year ending Sept. 30, 1917.

a Sunday.

NOTE.—Figures in this table do not include diversion into Champlain canal.

CEDAR RIVER NEAR INDIAN LAKE, N. Y.

LOCATION.—At steel highway bridge 2 miles west of Indian Lake village, Hamilton County, 8 miles by river above Rock River, 10 miles by river below Wakely dam, and about 12 miles above mouth of river.

DRAINAGE AREA.—85 square miles (measured on topographic maps).

RECORDS AVAILABLE.—July 15, 1911, to November 30, 1917, when station was discontinued.

GAGE.—Chain at downstream side of bridge; read by Chauncy Hill.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Gravel and large boulders; fairly permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 18.7 feet about midnight June 11 from watermarks observed by Mr. F. E. Wood (discharge not computed); minimum stage, 2.5 feet, October 12, 13, 14, and September 27 (discharge 20 second-feet).

1911–1917: Maximum stage recorded June 11, 1917; maximum discharge recorded, 3,700 second-feet, at 6 p. m., May 17, 1916 (gage height, 12.15 feet); minimum stage recorded, 2.10 feet at 4 p. m., September 27, 1915 (discharge, about 5 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Cedar River flow is controlled by a lumberman's dam (Wakely dam), which is used to make flood waves during the spring for log driving.

ACCURACY.—Stage-discharge relation fairly permanent. Rating curve well defined, between 15 and 600 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good except for periods of log-driving operations in the spring.

Discharge measurements of [illegible] River near Indian Lake, N. Y., during the year ending [illegible], 1917.

NOTE.—No correction for storage.

INDIAN LAKE RESERVOIR AT INDIAN LAKE, N. Y.

LOCATION.—At masonry storage dam at outlet of Indian Lake, 2 miles south of Indian Lake village, Hamilton County, and 7½ miles above mouth of Indian River.

DRAINAGE AREA.—131 square miles, including about 9.3 square miles of water surface of Indian Lake at the elevation of crest of spillway (measured on topographic maps.

RECORDS AVAILABLE.—Records of stage and gate openings from July, 1900, to September 30, 1917.

GAGES.—Elevation of water surface in reservoir is determined by chain gage on the crest of dam near gate house. Gage installed November 17, 1911, to replace staff gage previously maintained at the same point; datum unchanged. Widths of sluice gate openings determined by gage scales at sides of gate stems inside gate house. Gages read by Lester Savarie.

EXTREMES OF STAGE.—Maximum elevation of water surface in reservoir, 37.55 feet June 13; minimum elevation, 8.7 feet March 25.

1900–1917: Maximum elevation recorded, 38.8 feet March 28, 1913; Minimum stage recorded, 2.0 feet March 9 to 18, 1907, and January 3 to 17, 1910.

REGULATION.—At ordinary stages the discharge is completely regulated by the operation of the sluice gates. Water is held in storage until needed to supplement the flow of the upper Hudson during the low water period. This storage capacity of about 4.7 billion cubic feet provides for a discharge of approximately 600 second-feet for a period of 90 days.

For record of discharge see "Indian River near Indian Lake, N. Y." (p. 126).

Daily gage height, in feet, of Indian Lake reservoir at Indian Lake, N. Y., for the year ending Sept. 30, 1917.

Sept. 13, 5 p. m. to Sept. 30, 12 p. m.	60	

NOTE.—Main logway open 12 feet during the following periods: June 5, 5 a. m. to June 6, 9 a. m.; June 14, 5 a. m. to 5 p. m.; June [illegible] a. m. to [illegible] p. m.; June [illegible] a. m. to 5 p. m.; June 20, 8 a. m. to 5 p. m.; June 21, 4 a. m. to 5.30 p. m.; June 22, 5 a. m. to 11 a. m.; June 23, 7 a. m. to 7 p. m.

INDIAN RIVER NEAR INDIAN LAKE, N. Y.

LOCATION.—About three-fourths of a mile below dam at outlet of Indian Lake, 2 miles south of Indian Lake village, Hamilton County, 1 mile above mouth of Big Brook, and 6½ miles above mouth of Indian River.

DRAINAGE AREA.—132 square miles (measured on topographic maps).

RECORDS AVAILABLE.—July 1, 1912, to June 30, 1914; June 5, 1915, to September 30, 1917; also miscellaneous measurements in 1911.

GAGE.—Gurley repeating-hydrograph water-stage recorder; installed August 30, 1916, in a standard wooden shelter on the right bank three-fourths mile below dam, at same datum as staff gage previously used. The staff gage is still in place and used for checking the recorder. Recorder inspected by Lester Savarie.

DISCHARGE MEASUREMENTS.—Made from cable or by wading at the head of the rapids about 150 feet below the gage.

EXTREMES OF DISCHARGE.—Maximum stage, from water-stage recorder, 6.38 feet at 10.30 a. m., June 19 (discharge 2,410 second-feet); minimum stage, from water-stage recorder, 0.13 foot from 10 a. m. to 2 p. m., November 21 (discharge about 1.3 second-feet).

1912–1917: Maximum stage recorded, 7.8 feet at 4 p. m. March 28, 1913 (discharge about 3,460 second-feet); practically no flow when gates at Indian Lake are closed.

CHANNEL AND CONTROL.—The gage is at the side of a pool about 500 feet wide, called the "lower frog pond." The reef of coarse gravel at the outlet of this pool forms the control and is permanent.

ICE.—Stage-discharge relation not affected by ice.

REGULATION.—Discharge at this station is regulated by the operation of gates at the dam. (See Indian Lake Reservoir at Indian Lake, N. Y.)

ACCURACY.—Stage-discharge relation permanent. Rating curve well defined between 15 and 1,500 second-feet. Daily discharge ascertained by applying mean daily gage height to rating table for days when there have been no changes in the sluice gate openings at Indian Lake dam. Mean daily gage height determined by inspection of the hydrograph record. Discharge for days when gate openings are changed is mean of 24 hourly discharge values.

The following discharge measurement was made by O. W. Hartwell:

June 21, 1917: Gage height 4.76 feet; discharge 1,400 second-feet.

Daily discharge, in second-feet, of Indian River near Indian Lake, N. Y., for the year ending Sept. 30, 1917.

September	725	9	501
The year	1,880	2	321

NOTE.—Figures showing monthly discharge in second-feet per square mile and run-off depth in inches are not published for this station on account of the effect of storage in Indian Lake Reservoir, for which no correction has been made.

SCHROON RIVER AT RIVERBANK, N. Y.

Location.—At the steel highway bridge near Riverbank post office, Warren County, near Tumblehead Falls, about 9 miles below Schroon Lake and about 9 miles above Warrensburg.

Drainage area.—534 square miles.

Records available.—September 2, 1907, to September 30, 1917.

Gage.—Chain, on upstream side of bridge; read by J. H. Roberts.

Discharge measurements.—Made from the upstream side of bridge.

Channel and control.—Gravel; occasionally shifting. Logs become lodged on the control at times nearly every year.

Extremes of discharge.—Maximum stage recorded during year, 6.5 feet from 4 p. m. April 4 to 4 p. m. April 6 (discharge about 4,630 second-feet); minimum stage recorded, 1.31 feet at 4 p. m. October 18 and 19 (discharge, 122 second-feet).

1907–1917: Maximum stage recorded, 10.7 feet at 5 p. m. March 28, 1913 (discharge about 13,500 second-feet); minimum stage recorded, 0.85 foot at 5 p. m. October 17, 1909 (discharge, 28 second-feet).

Ice.—Stage-discharge relation affected by ice.

Regulation.—Flow affected by storage in Schroon and Brant lakes.

Accuracy.—Stage-discharge relation probably permanent during year. Affected by ice for much of the period from December to March and by logs on the control for short periods in April, May, and June. Rating curve fairly well defined between 150 and 4,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good for periods when stage-discharge relation was not affected by ice or logs; fairly good for other periods.

Discharge measurements of Schroon River at Riverbank, N. Y., during the year ending Sept. 30, 1917.

a Stage-discharge relation affected by ice.

SACANDAGA RIVER NEAR HOPE, N. Y

LOCATION.—About 1½ miles below junction of east and west branches, 3½ miles above Hope post office, Hamilton County, and 12 miles above Northville.

DRAINAGE AREA.—494 square miles (measured on topographic maps).

RECORDS AVAILABLE.—September 15, 1911, to September 30, 1917.

GAGE.—Staff in two sections, the lower inclined, the upper vertical; read by Melvin Willis.

DISCHARGE MEASUREMENTS.—Made from a cable about 100 feet below the gage or by wading

CHANNEL AND CONTROL.—Rocky; probably permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.35 feet at 6.20 p. m. June 11 (discharge 15,200 second-feet); minimum stage recorded, 1.49 feet at 6 p. m. September 29 (discharge 69 second-feet).

1911–1917: Maximum stage recorded, 10.0 feet at 5.30 p. m. March 27, 1913 (discharge, 24,800 second-feet); minimum stage recorded, 1.17 feet at 7.55 a. m. September 30, 1913 (discharge about 20 second-feet).

ICE.—Stage-discharge relation affected by ice.

ACCURACY.—Stage-discharge relation permanent; affected by ice during much of the period December to March, inclusive. Rating curve well defined between 60 and 10,000 second-feet. Gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good for periods when the stage-discharge relation is not affected by ice; fair for other periods.

Discharge measurements of Sacandaga River near Hope, N. Y., during the year ending Sept. 30, 1917.

SACANDAGA RIVER AT HADLEY, N. Y.

Location.—About half a mile west of railroad station at Hadley, Saratoga County, 1 mile above mouth of river and 4½ miles below site of proposed storage dam at Conklingville.

Drainage area.—1,060 square miles (measured on topographic maps).

Records available.—January 1, 1911, to September 30, 1917. September 13, 1907, to December 31, 1910, at upper bridge station; September 24, 1909, to August 31, 1911, at lower bridge station.

Gage.—Gurley graph water-stage recorder on the left bank, installed January 6, 1916, replacing a Barrett and Lawrence recorder. Recorder inspected by J. F. Kelly.

Discharge measurements.—Made from a cable about 30 feet above the gage, or by wading.

Channel and control.—Very rough but permanent.

Extremes of discharge.—Maximum stage recorded during year, from water stage recorder, 8.53 feet from noon until 10 p. m. April 4 (discharge, 12,800 second-feet); minimum stage, from water stage recorder, 2.58 feet at midnight September 27 (discharge, 169 second-feet).

Ice.—Stage-discharge relation seriously affected by ice.

Accuracy.—Stage-discharge relation permanent; affected by ice during a large part of period from December to March. Rating curve well defined between 150 and 20,000 second-feet. Operation of water stage recorder satisfactory throughout the year. Daily discharge ascertained by applying to the rating table mean daily gage height determined by inspecting gage-height graph. Records excellent for periods when the stage-discharge relation was not affected by ice; fairly good for other periods.

Discharge measurements of Sacandaga River at Hadley, N. Y., during the year ending Sept. 30, 1917.

HOOSIC RIVER NEAR EAGLE BRIDGE, N. Y.

LOCATION.—Half a mile below Walloomsac River and 1½ miles above Owl Kill and Eagle Bridge, Rensselaer County.

DRAINAGE AREA.—512 square miles (measured on topographic maps).

RECORDS AVAILABLE.—August 13, 1910, to September 30, 1917. September 25, 1903, to December 31, 1908, at Buskirk, 4 miles below present station.

GAGE.—Inclined staff on left bank near the farm house of James Russell. Prior to August 17, 1914, chain gage, 400 feet above present site; gage read by Mrs. Vashti Russell, Mrs. Viola Davis, and Mrs. Volney Russell.

DISCHARGE MEASUREMENTS.—Made from cable half mile below gage, or by wading.

CHANNEL AND CONTROL.—Gravel; somewhat shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 9.7 feet at 7.30 a. m., February 27 (discharge about 8,040 second-feet); minimum stage recorded, 2.68 feet at 6 a. m., September 24 (discharge about 44 second-feet).

1910–1917: Maximum stage not recorded, as gage used prior to August 17, 1914, could not be reached at high stages; minimum stage recorded, 6.1 feet at 5. p. m. September 14, 1913 (discharge practically zero).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Flow affected by storage on Walloomsac River and at Hoosick Falls about 2 miles above gage.

ACCURACY.—Stage-discharge relation probably permanent during year; affected by ice during much of period December to March, inclusive. Rating curve well defined between 75 and 7,000 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good except for periods of low water, when semi-daily gage heights may not indicate the true mean, and during periods when the stage-discharge relation is affected by ice; fair for the latter periods.

Discharge measurements of Hoosic River near Eagle Bridge, N. Y., during the year ending Sept. 30, 1917.

MOHAWK RIVER AT VISCHER FERRY DAM, N. Y.

Location.—At Vischer Ferry dam of Barge Canal (Lock No. 7), 1 mile above Stony Creek and Vischer Ferry, 7 miles below Schenectady, Schenectady County, and 11 miles above mouth.

Drainage area.—3,400 square miles (measured on topographic maps).

Records available.—June 24, 1913, to September 30, 1917.

Gage.—Stevens water-stage recorder (showing head on crest of spillway) in the southerly corner of the basin near upper end of Barge Canal lock, installed August 18, 1916; staff gage in masonry of outer lock wall, just above upper gates, read March 30 to May 23, 1914, and March 30 to August 17, 1916. Datum of staff gage 12.1 feet lower than that of recorder. Gurley water-stage recorder in the northerly (out-stream) corner of the basin, used December 17, 1913, to March 29, 1914, and May 24, 1914, to February 23, 1916. Inclined staff gage at foot of an old bridge abutment about 100 feet above Vischer Ferry, read June 24 to December 16, 1913, and May 24 to June 2, 1914. Water-stage recorder inspected by engineers from the Albany office of the United States Geological Survey; staff gage read by lock tenders.

Discharge measurements.—Made by wading below the dam at low-water during 1913–14. During the spring of 1915 the Crescent dam (next downstream) was closed, making further measurements impossible. No provision for measurements at medium and high stages.

Control.—The control is the crest of the spillway.

Extremes of discharge.—Maximum stage during year, from water-stage recorder, 4.07 feet at 9 a. m. June 12 (discharge, 51,500 second-feet); minimum stage, from water-stage recorder, 0.32 foot at 9 a. m. September 20 (discharge 800 second-feet).

1913–1917: Maximum stage recorded, 7.6 feet just before noon March 28, 1914, determined by leveling from flood marks (discharge not determined). This stage lasted but a few minutes and was caused by the breaking of an ice jam near Schenectady. Minimum stage from water-stage recorder, 0.18 foot from 4 a. m. to 5 a. m. and 4 p. m. to 6. p. m. October 31, 1914 (discharge about 290 second-feet).

Diversions.—Water was diverted into Erie canal at temporary lock in north end of dam prior to December, 1914. Measurements of this diversion were made at bridge 48, about a mile downstream, but no allowance for the diversion was made in computing the flow.

Barge Canal Lock No. 7, at the south end of dam was put in operation May 15, 1915. The following tables of discharge include the flow over the spillway, and through lock and water wheels.

Regulation.—Flow affected by operation of dams upstream.

Accuracy.—Stage-discharge relation practically permanent. Probably not affected by ice. Rating curve fairly well defined by discharge measurements between 350 and 2,500 second-feet; above 2,500 second-feet, based on theoretic coefficients. Gage in lock read to tenths twice daily January 29 to March 23; operation of water-stage recorder satisfactory for the remainder of year. Daily discharge ascertained from staff gage record by applying mean daily gage height to rating table; daily discharge for remainder of year determined by use of discharge integrator. Records fair.

Daily discharge, in second-feet, of Mohawk River at Vischer Ferry dam, N. Y., for the year ending Sept. 30, 1917.

DELAWARE RIVER BASIN.

EAST BRANCH OF DELAWARE RIVER AT FISH EDDY, N. Y.

LOCATION.—At railway bridge in village of Fish Eddy, Delaware County, about 4 miles below mouth of Beaver Kill and 5½ miles above confluence of East and West Branches.

DRAINAGE AREA.—790 square miles (measured on post-route map).

RECORDS AVAILABLE.—November 19, 1912, to September 30, 1917. Records were obtained at Hancock, about 4 miles below, from October 14, 1902, to December 31, 1912.

GAGE.—Staff, in two sections, on downstream end of left pier of railroad bridge; read by J. P. Lyons.

DISCHARGE MEASUREMENTS.—Made by wading or from the highway bridge about 200 feet above the gage.

CHANNEL AND CONTROL.—Coarse gravel; occasionally shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 12.3 feet at 8 a. m. March 28 (discharge about 18,100 second-feet); minimum stage recorded, 2.0 feet October 5 to 12 (discharge, 228 second-feet); minimum discharge, 95 second-feet, February 24 and 25 (stage-discharge relation affected by ice).

1912–1917: Maximum stage, 17.4 feet during the afternoon of March 27, 1913, determined by leveling from flood marks (discharge about 33,500 second-feet); minimum stage recorded, 1.64 feet at 5 p. m. October 12, 14, 15, 1914 (discharge 97 second-feet).

ICE.—Stage-discharge relation seriously affected by ice.

ACCURACY.—Stage-discharge relation apparently permanent; affected by ice during much of the period from December to March, inclusive. Rating curve well defined between 200 and 20,000 second-feet. Gage read to hundredths twice daily October 1 to December 31 and July 1 to September 30; to tenths once daily, January 1 to June 30. Daily discharge ascertained by applying mean daily gage height to rating table. Records good except for periods when the stage-discharge relation was affected by ice, for which they are fair.

COOPERATION.—Gage-height record January 1 to June 30 furnished by United States Weather Bureau.

Discharge measurements of East Branch of Delaware River at Fish Eddy, N. Y., during the year ending Sept. 30, 1917.

[Made by E. D. Burchard.]

DELAWARE RIVER AT PORT JERVIS, N. Y.

\t toll bridge at Port Jervis, Orange County, 1 mile above Neversink d 6 miles below Mongaup River.

REA.—3,250 square miles.

AILABLE.—October 12, 1904, to September 30, 1917.

f in two sections; the upper section vertical and attached to downstream ·ft abutment; the lower section inclined, about 30 feet downstream; read by ·lla Fuller. Prior to June 20, 1914, a chain gage on the bridge was used.

MEASUREMENTS.—Made from the bridge or by wading.

AND CONTROL.—Gravel; occasionally shifting.

OF DISCHARGE.—Maximum stage recorded during year, 11.3 feet at 8 a. m. 28 (discharge, 53,400 second-feet); minimum stage recorded, 1.6 feet, mber 27–30 (discharge 780 second-feet).

4–1917: Maximum stage recorded, 16.0 feet at 8 a. m. March 28, 1914 (dis-re, 92,700 second-feet); minimum stage recorded, 0.60 foot at 8 a. m. Septem-2 and 23, 1908 (discharge, 175 second-feet).

age-discharge relation somewhat affected by ice.

Y.—Stage-discharge relation practically permanent; affected by ice during e part of January and February. Rating curve well defined between 1,000 30,000 second-feet. Gage read to hundredths twice daily from October 1 December 31 and to tenths once daily, January 1 to September 30. Daily dis-urge ascertained by applying mean daily gage height to rating table. Records od for periods when the stage-discharge relation was not affected by ice and urly good for other periods.

RATION.—Gage-height record January 1 to September 30 furnished by United tates Weather Bureau.

arge measurements of Delaware River at Port Jervis, N. Y., during the year ending Sept. 30, 1917.

[Made by E. D. Burchard.]

DELAWARE RIVER AT RIEGELSVILLE, N. J.

LOCATION.—At [illegible] suspension bridge between Riegelsville, N. J., and Riegelsville, Pa., [illegible] feet above Musconetcong River and [illegible] miles below Lehigh River.

DRAINAGE AREA.—[illegible] square miles.

RECORDS AVAILABLE.—[illegible] 1906, to September 30, 1917.

GAGE.—Staff in three sections installed November 14, 1914, on left bank (New Jersey side) at upstream side of bridge; lower section inclined, middle and upper sections vertical. Prior to November 14, 1914, chain gage attached to upstream side of bridge. Gage read by J. H. Deemer to July 1, 1917, and after that date by Herbert J. Bernholz.

DISCHARGE MEASUREMENTS.—Made from bridge.

CHANNEL AND CONTROL.—Large bowlders; practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 18.1 feet at 4 p. m. March 28 (discharge, 88,400 second-feet); minimum stage recorded, 2.3 feet, September 30 (discharge, 1,990 second-feet).

1906–1916: Maximum stage[1] recorded, 25 feet March 28, 1913 (discharge, 144,000 second-feet); minimum stage recorded, 1.78 feet November 6, 1914 (discharge 1,170 second-feet).

ICE.—Discharge relation affected by ice, during severe winters only.

DIVERSIONS.—The Delaware division of the Pennsylvania canal diverts about 250 second-feet from Lehigh River near its mouth from about the last of March to the middle of December each year.

ACCURACY.—Stage discharge relation practically permanent; not seriously affected by ice during the year. Rating curve well defined. Gage read to quarter-tenths twice a day. Daily discharge obtained by applying mean daily gage heights to rating table. Records good.

The following discharge measurement was made by H. J. Jackson:

September 14, 1917: Gage height, 2.80 feet; discharge, 2,890 second-feet. Canal was measured also and discharge found to be 230 second-feet.

Daily discharge, in second-feet, of Delaware River at Riegelsville, N. J., for the year ending Sept. 30, 1917.

September	8,150	1,990	3,480	.577	.64
The year	86,100	1,990	9,940	1.57	21.38

NOTE.—To allow for water diverted by the canal, 230 second-feet was added to the daily discharge, Oct. 1 to Dec. 20 and Mar. 17 to Sept. 30, before computing discharge per square mile; first three columns of table therefore indicate actual quantity of water flowing in the river; the two remaining columns represent the total run-off from drainage area above Riegelsville, including the discharge of the canal.

BEAVER KILL AT COOKS FALLS, N. Y.

LOCATION.—At covered highway bridge in Cooks Falls, Delaware County.

DRAINAGE AREA.—236 square miles (measured on post-route and topographic maps).

RECORDS AVAILABLE.—July 25, 1913, to September 30, 1917.

GAGE.—Vertical staff, in two sections, bolted to rock on left bank under the bridge; read by J. L. Rosa and Ralph Rosa.

DISCHARGE MEASUREMENTS.—Made from the bridge or by wading a short distance downstream.

CHANNEL AND CONTROL.—Coarse gravel, boulders, and solid ledge; practically permanent.

EXTREMES OF DISCHARGE.—1913–1917: Maximum stage, determined from water marks on gage, 11.0 feet, some time during the night of March 27–28, 1917 (discharge about 7,870 second-feet); minimum stage recorded, 0.70 foot from 7 a. m. October 12 to 7 a. m. October 13, 1916 (discharge, 26 second-feet).

ICE.—Stage-discharge relation somewhat affected by ice.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice during portions of the period December to March, inclusive. Rating curve well defined between 50 and 4,500 second-feet. Gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good for periods when the stage-discharge relation was not affected by ice; fair for other periods.

Discharge measurements of Beaver Kill at Cooks Falls, N. Y., during the year ending Sept. 30, 1917.

[Made by E. D. Burchard.]

SUSQUEHANNA RIVER BASIN.

SUSQUEHANNA RIVER AT CONKLIN, N. Y.

Location.—At steel highway bridge just below Conklin, Broome County, 5 mil below Big Snake Creek and 8 miles above Chenango River.

Drainage area.—2,350 square miles.

Records available.—November 13, 1912, to September 30, 1917. Records we obtained at Binghamton, 8 miles below, from July 31, 1901, to December 31, 191

Gage.—Stevens water-stage recorder on left bank, just below the bridge, installe October 4, 1914. Prior to that date, staff in two sections, the lower sectic inclined; the upper vertical, attached to left abutment. Water-stage record inspected by Mrs. Cora Ames.

Discharge measurements.—Made from the bridge or by wading.

Channel and control.—Coarse gravel and boulders; probably permanent.

Extremes of discharge.—Maximum stage during year, from water-stage recorde 13.55 feet at 3 a. m. March 28 (discharge, 28,700 second-feet); minimum stag from water-stage recorder, 2.45 feet September 27 and 30 (discharge 500 secon feet).

Ice.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation practically permanent. Affected by ice for large portion of the period from January to March, inclusive. Rating curv well defined between 250 and 55,000 second-feet. Operation of water-stag recorder fairly satisfactory, except December 9–22, April 30 to May 12 and Jun 27 to July 17; staff gage read to hundredths twice daily December 9–22 an July 4 to 17. Daily discharge ascertained by applying mean daily gage heigh to rating table, except for days when the mean gage height would not give th true discharge within 1 per cent. For such days the discharge is the mean of 2 hourly determinations. Gage heights obtained by inspecting gage-height grap or by taking mean of two observations per day. Records good except fo periods when the stage-discharge relation was affected by ice, for which the are fair.

Discharge measurements of Susquehanna River at Conklin, N. Y., during the year endin Sept. 30, 1917.

CHENANGO RIVER NEAR CHENANGO FORKS, N. Y.

Location.—About 1½ miles below Tioughnioga River, 2 miles by road below Chenango Forks post office, Broome County, and 11½ miles above Binghamton and the mouth.

Drainage area.—1,380 square miles (revised). See "Diversions."

Records available.—November 11, 1912, to September 30, 1917. Records were obtained at Binghamton, July 31, 1901, to December 31, 1911.

Gage.—Stevens water-stage recorder on the left bank on the farm of Erastus Ingraham.

Discharge measurements.—Made from cable, about 100 feet above the gage, or by wading.

Channel and control.—Sand, gravel, and small cobblestones; practically permanent.

Extremes of discharge.—Maximum stage during year, from water stage recorder, 11.16 feet at 4 a. m. March 28 (discharge, 23,600 second-feet); minimum stage, from water stage recorder, 2.74 feet at 2 a. m. October 13 (discharge, 345 second-feet).

1901–1917: Maximum stage recorded, 12.18 feet from noon until 1 p. m. April 2, 1916 (discharge, 27,900 second-feet); minimum stage recorded, 4.6 feet at the former station in Binghamton at 8 a. m. August 29, 1909 (discharge about 10 second-feet).

Ice.—Stage-discharge relation affected by ice.

Diversions.—The run-off from 87.3 square miles at head of Chenango River and from 15.7 square miles at head of Tioughnioga River is stored in reservoirs and, except for discharge over the spillways, is diverted out of the drainage area through the Erie Canal. The above-mentioned drainage area for Chenango River does not include these two areas.

Accuracy.—Stage-discharge relation practically permanent; affected by ice for a large part of the period from January to March, inclusive. Rating curve well defined between 120 and 35,000 second-feet. Operation of water-stage recorder fairly satisfactory throughout the year. Daily discharge ascertained by applying to the rating table mean daily gage heights, determined by inspecting gage-height graph or for days of considerable fluctuation, by averaging the hourly discharge. Records good except for periods when stage-discharge relation was affected by ice, for which they are fair.

Discharge measurements of Chenango River near Chenango Forks, N. Y., during the year ending Sept. 30, 1917.

CHEMUNG RIVER AT CHEMUNG, N. Y.

Location.—At highway bridge about midway between Chemung, Chemung County, N. Y., and Willawana, Pa., half a mile upstream from State line and about [illegible] miles above mouth.

Drainage area.—[illegible] square miles.

Records available.—September [illegible], 19[illegible], to September 30, 1917.

Gage.—Chain gage on the upstream side of the [illegible] span of the bridge; read by [illegible] [illegible].

Discharge measurements.—Made from the bridge or by wading.

Channel and control.—Sand and gravel; occasionally shifting.

Extremes of discharge.—Maximum stage recorded during year, [illegible] feet at 4.45 p. m. March [illegible] (discharge, [illegible] second-feet); minimum stage recorded [illegible] feet at [illegible] a. m. [illegible] [illegible] (discharge [illegible] second-feet); minimum discharge [illegible] second-feet February [illegible] (stage-discharge relation affected by ice).

19[illegible]-1917: Maximum stage recorded, [illegible] feet at [illegible] a. m. June [illegible], 19[illegible] (discharge about [illegible] second-feet); minimum stage recorded, [illegible] feet at [illegible] a. m. August 14, 19[illegible] (discharge about [illegible] second-feet).

Ice.—Stage-discharge relation affected by ice.

Regulation.—Power is developed above the station, the largest plant being at Elmira, N. Y.

Accuracy.—Stage-discharge relation practically permanent; affected by ice for a large portion of the period from December to March, inclusive. Rating curve well defined between [illegible] and [illegible] second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good, except for periods when the stage-discharge relation was affected by ice; fair for other periods.

Discharge measurements of Chemung River at Chemung, N. Y., during the year ending Sept. 30, 1917.

CHEMUNG RIVER AT CHEMUNG, N. Y.

LOCATION.—At highway bridge about midway between Chemung, Chemung County, N. Y., and Willawana, Pa., half a mile upstream from State line and about 10 miles above mouth.

DRAINAGE AREA.—2,440 square miles.

RECORDS AVAILABLE.—September 11, 1903, to September 30, 1917.

GAGE.—Tape gage at the upstream side of the right span of the bridge; read by D. L. Orcutt.

DISCHARGE MEASUREMENTS.—Made from the bridge or by wading.

CHANNEL AND CONTROL.—Sand and gravel; occasionally shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 11.7 feet at 4.45 p. m. March 12 (discharge, 27,600 second-feet); minimum stage recorded 1.91 feet at 6 a. m. October 14 (discharge 260 second-feet); minimum discharge 220 second-feet February 15–16 (stage-discharge relation affected by ice).

1903–1917: Maximum stage recorded, 17.46 feet at 5 a. m. June 18, 1916 (discharge about 63,200 second-feet); minimum stage recorded, 1.47 feet at 7 a. m. August 14, 1911 (discharge about 49 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Power is developed above the station, the largest plant being at Elmira, N. Y.

ACCURACY.—Stage-discharge relation probably permanent; affected by ice for a large portion of the period from December to March, inclusive. Rating curve well defined between 200 and 45,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good, except for periods when the stage-discharge relation was affected by ice; fair for other periods.

Discharge measurements of Chemung River at Chemung, N. Y., during the year ending Sept. 30, 1917.

[Made by E. D. Burchard.]

PATUXENT RIVER BASIN.

PATUXENT RIVER NEAR BURTONSVILLE, MD.

LOCATION.—At Columbia turnpike bridge, 1½ miles northeast of Burtonsville, Mon gomery County, and about 4 miles northwest of Laurel.

DRAINAGE AREA.—127 square miles.

RECORDS AVAILABLE.—July 21, 1911, to June 15, 1912 (records furnished by Unite States Engineer Office); July 21, 1913, to September 30, 1917.

GAGE.—Stevens water-stage recorder referred to a staff gage in three sections on le bank about 80 feet below highway bridge; prior to July 23, 1914, a vertical sta fastened to left side of bridge pier; datum of recorder is 1.29 feet below that gage on pier. Recorder inspected by Columbus Brashears and Arthur Beall.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Banks are lined with trees and brush and overflow stage of about 10 feet. Control is a flat gravel bar about 300 feet below bridg Current is swift under bridge, but sluggish below bridge to control. Discharg measurements indicate that control shifted during the flood of July 12–13, 1917.

EXTREMES OF DISCHARGE.—Maximum stage during year, 10.45 feet at 8 a. m. Jul 13 (discharge, 3,060 second-feet); minimum stage, from water-stage recorder, 1.9 feet September 23 (discharge, 47 second-feet). A stage of 1.70 feet occurred 3 a. m. February 3 and was probably caused by freezing at headwaters.

1911–1917: Maximum stage recorded, 14.6 feet about 9 a. m. January 12, 191 (discharge, from poorly defined rating curve, 5,100 second-feet); minimum stage 0.18 foot August 25, 1911 (discharge, 6 second-feet).

ICE.—Stage-discharge relation affected by ice during severe winters only.

ACCURACY.—Stage-discharge relation changed during the high water of July 12–13 affected by ice February 3–20. Rating curve well defined between 50 and 2,00 second-feet, used October 1 to July 12; curve well defined between 50 and 20 second-feet and fairly well defined above 200 second-feet used July 13 to Sep tember 30. Operation of water-stage recorder satisfactory throughout the year except for period December 20–24. Daily discharge ascertained by use of discharg integrator, by hourly method, and by use of mean daily gage heights obtained by inspecting recorder graph. Records excellent.

Discharge measurements of Pautuxent River near Burtonsville, Md., during the yea ending Sept. 30, 1917.

POTOMAC RIVER BASIN.

POTOMAC RIVER AT POINT OF ROCKS, MD.

LOCATION.—At steel highway bridge at Point of Rocks, Frederick County, about one-third mile below Catoctin Creek and 6 miles above Monocacy River.

DRAINAGE AREA.—9,650 square miles.

RECORDS AVAILABLE.—February 17, 1895, to September 30, 1917.

GAGE.—Chain, attached to downstream side of left span of bridge; read by G. H. Hickman. Datum constant since September 2, 1902; prior to this date datum was 0.45 foot higher than at present. Sea-level elevation of gage datum, 200.54 feet.

DISCHARGE MEASUREMENTS.—Made from the bridge.

CHANNEL AND CONTROL.—Practically permanent. The control is a ledge a few hundred feet below the station, the ledge extending completely across the river except for one relatively unimportant channel.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 17.9 feet at 1.30 p. m., March 13 (discharge 121,000 second-feet); minimum stage recorded, 0.43 foot at 9 a. m., September 29 (discharge 643 second-feet).

1895–1916: Maximum stage recorded, 29 feet on March 2, 1902 (discharge 219,000 second-feet); minimum stage, 0.38 foot on September 10, 1914 (discharge 540 second-feet).

ICE.—Stage discharge relation seldom affected by ice.

DIVERSIONS.—The Chesapeake & Ohio Canal parallels the Potomac on the Maryland side. The average discharge of the canal is 75 to 100 second-feet. The discharge is not included in the following tables.

REGULATION.—Fluctuation at extremely low stages has been noted and is probably caused by the operation of power plants on the upper Potomac and tributaries.

ACCURACY.—Stage-discharge relation practically permanent; affected by ice gorge about a mile below from February 13 to 21. Rating curve well defined except at extremely low water. Gage read to hundredths once daily; during high water read oftener. Daily discharge ascertained by applying daily gage heights to rating table. Records excellent except those for extremely low stages, which are fair.

The following discharge measurement was made by G. C. Stevens and B. L. Hopkins:

August 23, 1917: Gage height, 1.04 feet; discharge, 2,040 second-feet.

Daily discharge, in second-feet, of Potomac River at Point of Rocks, Md., for the year ending Sept. 30, 1917.

MONOCACY RIVER NEAR FREDERICK, MD.

Location.—At Ceresville bridge on toll road leading from Frederick, Frederic County, to Mount Pleasant, about 3,000 feet below Tuscarora Creek (enterin from right), 2,000 feet above Israel Creek (entering from left), and 3 miles nortl east of Frederick.

Drainage area.—660 square miles.

Records available.—August 4, 1896, to September 30, 1917.

Gage.—Chain attached to downstream side of right span of bridge; read by Eugene I Derr.

Discharge measurements.—Made from the bridge or by wading.

Channel and control.—Bed composed of gravel and boulders; shifting during ver high floods. Control not well defined. Banks lined with trees and brush; subjec to overflow at high stages.

Extremes of discharge.—Maximum stage recorded during the year, 20.4 feet at 9.3 a. m. March 13 (discharge, 12,700 second-feet); minimum stage recorded, 4.2 feet October 10 (discharge, 122 second-feet).

1896–1917: Maximum stage recorded, 27.2 feet at 11 a. m. January 13, 191 (discharge determined from rating curve used for 1916, 19,000 second-feet) minimum stage, 3.54 feet several days in October, 1910 (discharge, 15 second feet).

Ice.—Stage-discharge relation affected by ice during severe winters only.

Accuracy.—Stage-discharge relation changed during high water in March, 1917; no affected by ice during the year. Rative curves well defined between 200 and 15,000 second-feet used before and after March 15. Discharge measurement made during high water of March, 1917, indicate that rating curves used prior to 1916 gave results about 20 per cent too large at high stages. Gage read to half tenths once daily; oftener during high water. Daily discharge ascertained by applying gage height to rating table. Records good.

Discharge measurements of Monocacy River near Frederick, Md., during the year ending Sept. 30, 1917.

RAPPAHANNOCK RIVER BASIN.

RAPPAHANNOCK RIVER NEAR FREDERICKSBURG, VA.

LOCATION.—At rear of McWhirt farm, 1½ miles above dam of Spottsylvania Power Co. and 3½ miles above Fredericksburg, Spottsylvania County.

DRAINAGE AREA.—1,590 square miles.

RECORDS AVAILABLE.—September 19, 1907, to September 30, 1917.

GAGE.—Vertical staff on right bank; installed November 4, 1913, to replace chain gage destroyed October 31, 1913. Original gage was a vertical staff which was destroyed February 14, 1908, and replaced February 20, 1908, by a chain gage under the cable. All three gages at practically the same location and referred to same datum. Gage read by Charles Perry.

DISCHARGE MEASUREMENTS.—Made from cable at gage. At extremely low water measurements can be made by wading or from a bridge over the power canal below the dam.

CHANNEL AND CONTROL.—Bed composed of boulders; somewhat rough. One channel. Banks wooded; water overflows right bank at stage about 15 feet and left bank at about 12 feet. Current sluggish at extremely low water. Control is a rocky section a few hundred feet below the gage; practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage during the year, 8.5 feet March 5, determined from flood marks at gage (discharge, 23,100 second-feet); minimum stage recorded, 0.78 foot, October 10 and 13 (discharge, 212 second-feet).

1907–1917: Maximum stage recorded, 11.0 feet January 13, 1915, determined by leveling from flood marks (discharge, from extension of rating curve, 36,300 second-feet); minimum stage recorded, 0.30 foot at 3 p. m. August 21, 1914 (discharge, 72 second-feet).

ICE.—Ice forms near gage but seldom in sufficient quantity at control to affect stage-discharge relation.

ACCURACY.—Stage-discharge relation practically permanent; not affected by ice during year. Rating curve well defined except for extremely high and low stages. Gage read to hundredths twice daily; readings reported during the winter of 1916–17 not entirely reliable. Daily discharge ascertained by applying mean daily gage height to rating table. Records good except for winter months. Comparison with records for other stations indicates that the winter records of the Rappahannock are not subject to large errors.

The following discharge measurement was made by G. C. Stevens:

March 9, 1917: Gage height, 3.44 feet; discharge, 3,890 second-feet.

Daily discharge, in second-feet, of Rappahannock River near Fredericksburg, Va., for the year ending Sept. 30, 1917.

PUBLICATIONS RELATING TO WATER RESOURCES

PART I. NORTH ATLANTIC SLOPE BASINS

STREAM-GAGING STATIONS AND PUBLICATIONS RELATING TO WATER RESOURCES.

PART I. NORTH ATLANTIC SLOPE BASINS.

INTRODUCTION.

Investigation of water resources by the United States Geological Survey has consisted in large part of measurements of the volume of flow of streams and studies of the conditions affecting that flow, but it has comprised also investigation of such closely allied subjects as irrigation, water storage, water powers, underground waters, and quality of waters. Most of the results of these investigations have been published in the series of water-supply papers, but some have appeared in the bulletins, professional papers, monographs, and annual reports.

The results of stream-flow measurements are now published annually in 12 parts, each part covering an area whose boundaries coincide with natural drainage features as indicated below.

PART I. North Atlantic slope basins.
II. South Atlantic slope and eastern Gulf of Mexico basins.
III. Ohio River basin.
IV. St. Lawrence River basin.
V. Upper Mississippi River and Hudson Bay basins.
VI. Missouri River basin.

XII. North Pacific slope basins, in three volumes:
A, Pacific slope basins in Washington and upper Columbia River basin.
B, Snake River basin.
C, Lower Columbia River basin and Pacific slope basins in Oregon.

This appendix contains, in addition to the list of gaging stations and the annotated list of publications relating specifically to the section, a similar list of reports that are of general interest in many sections and cover a wide range of hydrologic subjects; also brief references to reports published by State and other organizations (p. XXIII).

HOW GOVERNMENT REPORTS MAY BE OBTAINED OR CONSULTED.

Water-supply papers and other publications of the United States Geological Survey containing data in regard to the water resources of the United States may be obtained or consulted as indicated below.

1. Copies may be obtained free of charge by applying to the Director of the Geological Survey, Washington, D. C. The edition printed for free distribution is, however, small and is soon exhausted.

2. Copies may be purchased at nominal cost from the Superintendent of Documents, Government Printing Office, Washington, D. C., who will on application furnish lists giving prices.

3. Sets of the reports may be consulted in the libraries of the principal cities in the United States.

4. Complete sets are available for consultation in the local offices of the water-resources branch of the Geological Survey as follows:

Boston, Mass., 2500 Customhouse.
Albany, N. Y., 704 Journal Building.
Atlanta, Ga., Post Office Building.
Madison, Wis., c/o Railroad Commission of Wisconsin.
Topeka, Kans., 25 Federal Building.
Austin, Tex., Capitol Building.
Helena, Mont., Montana National Bank Building.
Denver, Colo., 403 New Post Office Building.
Tucson, Ariz., University of Arizona.
Salt Lake City, Utah, 421 Federal Building.
Boise, Idaho, 615 Idaho Building.
Tacoma, Wash., 406 Federal Building.
Portland, Oreg., 606 Post Office Building.
San Francisco, Cal., 328 Customhouse.
Los Angeles, Cal., 619 Federal Building.
Honolulu, Hawaii, 14 Capitol Building.

A list of the Geological Survey's publications may be obtained by applying to the Director, United States Geological Survey, Washington, D. C.

STREAM-FLOW REPORTS.

Stream-flow records have been obtained at more than 4,240 points in the United States, and the data obtained have been published in the reports indicated in the following table:

Stream-flow data in reports of the United States Geological Survey.

[A—Annual Report; B—Bulletin; W—Water-Supply Paper.]

Report.	Character of data.	Year.
10th A, pt. 2	Descriptive information only	
11th A, pt. 2	Monthly discharge and descriptive information	1884 to Sept., 1890.
12th A, pt. 2	....do	1884 to June 30, 1891.
13th A, pt. 3	Mean discharge in second-feet	1884 to Dec. 31, 1892.
14th A, pt. 2	Monthly discharge (long-time records, 1871 to 1893)	1888 to Dec. 31, 1893.
B 131	Descriptions, measurements, gage heights, and ratings	1893 and 1894.
16th A, pt. 2	Descriptive information only	
B 140	Descriptions, measurements, gage heights, ratings, and monthly discharge (also many data covering earlier years).	1895.

Stream-flow data in reports of the United States Geological Survey—Continued.

Report.	Character of data.	Year.
W 11	Gage heights (also gage heights for earlier years)	1896.
18th A, pt. 4	Descriptions, measurements, ratings, and monthly discharge (also similar data for some earlier years).	1895 and 1896.
W 15	Descriptions, measurements, and gage heights, eastern United States, eastern Mississippi River, and Missouri River above junction with Kansas.	1897.
W 16	Descriptions, measurements, and gage heights, western Mississippi River below junction of Missouri and Platte, and western United States.	1897.
19th A, pt. 4	Descriptions, measurements, ratings, and monthly discharge (also some long-time records).	1897.
W 27	Measurements, ratings, and gage heights, eastern United States, eastern Mississippi River, and Missouri River.	1898.
W 28	Measurements, ratings, and gage heights, Arkansas River and western United States.	1898.
20th A, pt. 4	Monthly discharge (also for many earlier years)	1898.
W 35 to 39	Descriptions, measurements, gage heights, and ratings	1899.
21st A, pt. 4	Monthly discharge	1899.
W 47 to 52	Descriptions, measurements, gage heights, and ratings	1900.
22d A, pt. 4	Monthly discharge	1900.
W 65, 66	Descriptions, measurements, gage heights, and ratings	1901.
W 75	Monthly discharge	1901.
W 82 to 85	Complete data	1902.
W 97 to 100	....do	1903.
W 124 to 135	....do	1904.
W 165 to 178	....do	1905.
W 201 to 214	....do	1906.
W 241 to 252	....do	1907-8.
W 261 to 272	....do	1909.
W 281 to 292	....do	1910.
W 301 to 312	....do	1911.
W 321 to 332	....do	1912.
W 351 to 362	....do	1913.
W 381 to 394	....do	1914.
W 401 to 414	....do	1915.
W 431 to 444	....do	1916.
W 451 to 464	....do	1917.

NOTE—No data regarding stream flow are given in the 15th and 17th annual reports.

The records at most of the stations discussed in these reports extend over a series of years, and miscellaneous measurements at many points other than regular gaging stations have been made each year. An index of the reports containing records obtained prior to 1904 has been published in Water-Supply Paper 119.

The following table gives, by years and drainage basin, the numbers of papers on surface-water supply published from 1899 to 1917. The data for any particular station will be found in the reports covering the years during which the station was maintained. For example, data for 1902 to 1917 for any station in the area covered by Part III are published in Water-Supply Papers 83, 98, 128, 169, 205, 243, 263, 283, 303, 323, 353, 383, 403, 433, and 453 which contain records for the Ohio River basin for those years.

Numbers of water-supply papers containing results of stream measurements, 1899–1917.

Year.	I. North Atlantic slope basins (St. John River to York River).	II. South Atlantic and eastern Gulf of Mexico basins (James River to the Mississippi).	III. Ohio River basin.	IV. St. Lawrence River and Great Lakes basins.	V. Hudson Bay and upper Mississippi River basins.	VI. Missouri River basin.	VII. Lower Mississippi River basin.	VIII. Western Gulf of Mexico basins.	IX. Colorado River basin.	X. Great Basin.	XI. Pacific slope basins in California.	XII. North Pacific slope basins. Pacific slope basins in Washington and upper Columbia River.	XII. North Pacific slope basins. Snake River basin.	XII. North Pacific slope basins. Lower Columbia River and Pacific slope basins in Oregon.

a Rating tables and index to Water-Supply Papers 35–39 contained in Water Supply Paper 39. Tables of monthly discharge for 1899 in Twenty-first Annual Report, Part IV.
b James River only.
c Gallatin River.
d Green and Gunnison rivers and Grand River above junction with Gunnison.
e Mohave River only.
f Kings and Kern rivers and south Pacific slope basins.
g Rating tables and index to Water-Supply Papers 47–52 and data on precipitation, wells, and irrigation in California and Utah contained in Water-Supply Paper 52. Tables of monthly discharge for 1900 in Twenty-second Annual Report, Part IV.
h Wissahickon and Schuylkill rivers to James River.
i Scioto River.
j Loup and Platte rivers near Columbus, Nebr., and all tributaries below junction with Platte.
k Tributaries of Mississippi from east.
l Lake Ontario and tributaries to St. Lawrence River.
m Hudson Bay only.
n New England Rivers only.
o Hudson River to Delaware River, inclusive.
p Susquehanna River to Yadkin River, inclusive.
q Platte and Kansas Rivers.
r Great Basin in California except Truckee and Carson River basins.
s Below junction with Gila.
t Rogue, Umpqua, and Siletz Rivers only.

In these papers and in the following lists the stations are arranged in downstream order. The main stem of any river is determined by measuring or estimating its drainage area—that is, the headwater stream having the largest drainage area is considered the continuation of the main stream and local changes in name and lake surface are disregarded. All stations from the source to the mouth of the main stem of the river are presented first, and the tributaries in regular order from source to mouth follow, the streams in each tributary basin being listed before those of the next basin below.

In exception to this rule the records for Mississippi River are given in four parts, as indicated on page III, and the records for large lakes are taken up in order of streams around the rim of the lake.

PRINCIPAL STREAMS.

The principal streams flowing into the Atlantic Ocean between St. John River, Maine-New Brunswick, and York River, Virginia, are the St. Croix, Machias, Union, Penobscot, Kennebec, Androscoggin, Saco, Merrimack, Mystic, Blackstone, Connecticut, Hudson, Delaware, Susquehanna, Potomac, and Rappahannock. The streams drain wholly or in part the States of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Jersey, New Hampshire, New York, Pennsylvania, Rhode Island, Vermont, Virginia, and West Virginia.

GAGING STATIONS.[1]

NOTE.—Dash after date indicates that station was being maintained September 30, 1917. Period after a date indicates discontinuance.

ST. JOHN RIVER BASIN.

St. John River near Dickey, Maine, 1910–11.
St. John River at Fort Kent, Maine, 1905–1915.
St. John River at Van Buren, Maine, 1908–
- Allagash River near Allagash, Maine, 1910–11.
- St. Francis River at St. Francis, Maine, 1910–11.
- Fish River at Wallagrass, Maine, 1903–1908; 1911.
- Madawaska River at St. Rose du Degele, Quebec, 1910–11.
- Aroostook River at Fort Fairfield, Maine, 1903–1910.

ST. CROIX RIVER BASIN.

St. Croix River near Woodland (Spragues Falls), Maine, 1902–1911.
St. Croix River at Baring, Maine, 1914.
- West Branch of St. Croix River at Baileyville, Maine, 1910–1912.

MACHIAS RIVER BASIN.

Machias River at Whitney, Maine, 1903–

[1] St. John River to York River, inclusive.

UNION RIVER BASIN.

Union River, West Branch (head of Union River), at Amherst, Maine, 1909-
Union River, West Branch, near Mariaville, Maine, 1909.
Union River at Ellsworth, Maine, 1909.
East Branch of Union River near Waltham, Maine, 1909.
Webb Brook at Waltham, Maine, 1909.
Green Lake (head of Reeds Brook) at Green Lake, Maine, 1909–1912.
Reeds Brook [Green Lake Stream] at Lakewood, Maine, 1909–1913.
Branch Lake (head of Branch Lake Stream) near Ellsworth, Maine, 1909–1915.
Branch Lake Stream near Ellsworth, Maine, 1909–1914.

PENOBSCOT RIVER BASIN.

Penobscot River, West Branch (head of Penobscot River), at Millinocket, Maine, 1901–
Penobscot River, West Branch, near Medway, Maine, 1916–
Penobscot River at West Enfield, Maine, 1901–
Penobscot River at Sunkhaze rips, near Costigan, Maine, 1899–1900.
East Branch of Penobscot River at Grand Lake dam, Maine, 1912.
East Branch of Penobscot River at Grindstone, Maine, 1902–
Mattawamkeag River at Mattawamkeag, Maine, 1902–
Piscataquis River near Foxcroft, Maine, 1902–
Passadumkeag River at Lowell, Maine, 1915–
Cold Stream Pond (head of Cold Stream), Maine, 1900–1911 (record of opening and closing of pond).
Cold Stream at Enfield, Maine, 1904–1906.
Kenduskeag Stream near Bangor, Maine, 1908–
Orland River:
Phillips Lake outlet near East Holden, Maine, 1904–1908.

ST. GEORGE RIVER BASIN.

St. George River at Union, Maine, 1913–14.

KENNEBEC RIVER BASIN.

Moose River (head of Kennebec River) near Rockwood, Maine, 1902–1908; 1910–1912.
Moosehead Lake (on Kennebec River) at Greenville, Maine, 1903–1906 (stage only).
Moosehead Lake at east outlet, Maine (stage only), 1895–
Kennebec River at The Forks, Maine, 1901–
Kennebec River at Bingham, Maine, 1907–1910.
Kennebec River at North Anson, Maine, 1901–1907.
Kennebec River at Waterville, Maine, 1892–1916.
Kennebec River at Gardiner, Maine, 1785–1910 (record of opening and closing of navigation).
Roach River at Roach River, Maine, 1901–1908.
Dead River near The Forks, Maine, 1901–1907; 1910–
Carrabassett River at North Anson, Maine, 1901–1907.
Sandy River near Farmington, Maine, 1910–1915.
Sandy River near Madison, Maine, 1904–1908.
Sebasticook River at Pittsfield, Maine, 1908–
Messalonskee Stream at Waterville, Maine, 1903–1905.
Cobbosseecontee Lake (on Cobbosseecontee Stream), Maine, 1839–1911 (dates of opening and closing).
Cobbosseecontee Stream at Gardiner, Maine, 1890–1915.

ANDROSCOGGIN RIVER BASIN.

Rangeley Lake (head of Androscoggin River), Maine, 1879–1911 (dates of opening and closing).
Androscoggin River at Errol dam, N. H., 1905–
Androscoggin River at Berlin, N. H., 1913–
Androscoggin River at Gorham, N. H., 1903 (fragmentary).
Androscoggin River at Shelburne, N. H., 1903–1907; 1910.
Androscoggin River at Rumford Falls, Maine, 1892–1903; 1905–
Androscoggin River at Dixfield, Maine, 1902–1908.
    Magalloway River at Aziscohos dam, Maine, 1912–
    Auburn Lake, Maine, 1890–1911 (date of opening).
    Little Androscoggin River at Bisco Falls, near South Paris, Maine, 1913–

PRESUMPSCOT RIVER BASIN.

Presumpscot River at outlet of Sebago Lake, Maine, 1887–

SACO RIVER BASIN.

Saco River near Center Conway, N. H., 1903–1912.
Saco River at Cornish, Maine, 1916–
Saco River at West Buxton, Maine, 1907–
    Ossipee River at Cornish, Maine, 1916–

MERRIMACK RIVER BASIN.

Pemigewasset River (head of Merrimack River) at Plymouth, N. H., 1886–1913.
Merrimack River at Franklin Junction, N. H., 1903–
Merrimack River at Garvins Falls, N. H., 1904–1915.
Merrimack River at Lowell, Mass., 1848–1861; 1866–1916.
Merrimack River at Lawrence, Mass., 1880–
    Middle Branch of Pemigewasset River at North Woodstock, N. H., 1911–12.
    Lake Winnepesaukee at Lakeport, N. H., 1860–1911. (Stage only.)
    Contoocook River at West Hopkinton, N. H., 1903–1907.
    Suncook River at East Pembroke, N. H., 1904–5.
    Souhegan River at Merrimack, N. H., 1909–
    Nashua River:
        South Branch of Nashua River, Clinton, Mass., 1896–
    Concord River at Lowell, Mass., 1901–1916.
        Sudbury River at Framingham, Mass., 1875–
            Lake Cochituate at Cochituate, Mass., 1863–

MYSTIC RIVER BASIN.

Mystic Lake (on Mystic River) near Boston, Mass., 1878–1897.

CHARLES RIVER BASIN.

Charles River at Waltham, Mass., 1903–1909.

TAUNTON RIVER BASIN.

Matfield River (head of Taunton River) at Elmwood, Mass., 1909–10.
    Satucket River near Elmwood, Mass., 1909–10.

PROVIDENCE RIVER BASIN.

Providence River:
Seekonk River:
Tenmile River near Rumford, R. I., 1909.
Blackstone River at Woonsocket, R. I., 1904-5.
Blackstone River at Albion, R. I., 1914-
Blackstone River at Berkeley, R. I., 1901-2.
Branch River at Branch Village, R. I., 1909-10; 1912-13.
Woonasquatucket River at Olneyville, R. I., 1910

PAWTUXET RIVER BASIN.

Pawtuxet River at Harris, R. I., 1909.

PAWCATUCK RIVER BASIN.

Pawcatuck River:
Wood River at Hope Valley, R. I., 1909-10.

THAMES RIVER BASIN.

Thames River:
Quinebaug River:
Shetucket River at Willimantic, Conn., 1904-5.

CONNECTICUT RIVER BASIN.

Connecticut River at First Lake, near Pittsburg, N. H., 1917-
Connecticut River at Orford, N. H., 1900-
Connecticut River at Sunderland, Mass., 1904-
Connecticut River at Holyoke, Mass., 1880-1899.
Connecticut River at Hartford, Conn., 1896-1908.
Israel River above South Branch, near Jefferson Highlands, N. H., 1903-1906.
Israel River below South Branch, at Jefferson Highlands, N. H., 1903-1907.
Passumpsic River at Pierce's Mills, near St. Johnsbury, Vt., 1909-
Passumpsic River at St. Johnsbury Center, Vt., 1903.
Ammonoosuc River at Bretton Woods, N. H., 1903-1907.
Zealand River near Twin Mountains, N. H., 1903-1907.
Little River at Twin Mountain, N. H., 1904-5.
White River at Sharon, Vt., 1903-4; 1909-1913.
White River at West Hartford, Vt., 1915-
Ashuelot River at Winchester, N. H., 1903-4.
Ashuelot River at Hinsdale, N. H., 1907-1909; 1914-
Millers River at Wendell Depot, Mass., 1909-1913.
Millers River near Winchenden, Mass., 1916-
Millers River at Erving, Mass., 1914-
Sip Pond Brook near Winchenden, Mass., 1916-
Priest Brook near Winchenden, Mass., 1916-
Otter River near Gardner, Mass., 1916-17.
East Branch Tully River near Athol, Mass., 1916-
Moss Brook at Wendell Depot, Mass., 1909-10; 1916-
Deerfield River at Hoosac Tunnel, Mass., 1909-1913.
Deerfield River at Charlemont, Mass., 1913-
Deerfield River at Shelburne Falls, Mass., 1907-1913.
Deerfield River at Deerfield, Mass., 1904-5.
Ware River (head of Chicopee River) at Ware, Mass., 1904-1911.
Ware River at Gibbs Crossing, Mass., 1912-
Burnshirt River near Templeton, Mass., 1909.
Swift River at West Ware, Mass., 1910-
Quaboag River at West Warren, Mass., 1903-1907.
Quaboag River at West Brimfield, Mass., 1909-

Connecticut River tributaries—Continued.
Westfield River at Knightville, Mass., 1909–
Westfield River at Russell, Mass., 1904–5.
Westfield River near Westfield, Mass., 1914–
Middle Branch of Westfield River at Goss Heights, Mass., 1910–
West Branch of Westfield River at Chester, Mass., 1915.
Westfield Little River near Westfield, Mass., 1905–
Borden Brook near Westfield, Mass., 1910–
Farmington River near New Boston, Mass., 1913–
Salmon River at Leesville, Conn., 1905–6.

HOUSATONIC RIVER BASIN.

Housatonic River near Great Barrington, Mass., 1913–
Housatonic River at Falls Village, Conn., 1912–
Housatonic River at Gaylordsville, Conn., 1900–1914.
Tenmile River at Dover Plains, N. Y., 1901–1903.
Pomperaug River at Bennetts Bridge, Conn., 1913–1916.

MIANUS RIVER BASIN.

Mianus River at Bedford, N. Y., 1903.
Mianus River near Stamford, Conn., 1903.

BYRAM RIVER BASIN.

Byram River, West Branch (head of Byram River), near Port Chester, N. Y., 1903.
Byram River at Pemberwick, Conn., 1903.
East Branch of Byram River near Greenwich, Conn., 1903.
Middle Branch of Byram River near Riverville, Conn., 1903.

HUDSON RIVER BASIN.

Hudson River near Indian Lake, N. Y., 1916–
Hudson River at North Creek, N. Y., 1907–
Hudson River at Thurman, N. Y., 1907–
Hudson River at Corinth, N. Y., 1904–1912.
Hudson River at Spier Falls, N. Y., 1912–
Hudson River at Fort Edward, N. Y., 1899–1908.
Hudson River at Mechanicville, N. Y., 1890–
Cedar River near Indian Lake, N. Y., 1911–
Indian Lake reservoir near Indian Lake, N. Y., 1900–
Indian River near Indian Lake, N. Y., 1912–1914; 1915–
Schroon Lake (on Schroon River) at Pottersville, N. Y., 1908–1911.
Schroon River at Riverbank, N. Y., 1907–
Schroon River at Warrensburg, N. Y., 1895–1902.
Sacandaga River at Wells, N. Y., 1907–1911.
Sacandaga River near Hope, N. Y., 1911–
Sacandaga River at Northville, N. Y., 1907–1910.
Sacandaga River near Hadley, N. Y., 1907–1910.
Sacandaga River (at cable) at Hadley, N. Y., 1911–
Sacandaga River at Union Bag & Paper Co.'s mill at Hadley, N. Y., 1909–1911.
West Branch of Sacandaga River at Whitehouse, N. Y., 1910.
West Branch of Sacandaga River at Blackbridge, near Wells, N. Y., 1911–1916.
Batten Kill at Battenville, N. Y., 1908.
Fish Creek at Burgoyne, N. Y., 1905; 1908.
Hoosic River near Eagle Bridge, N. Y., 1910–

Hudson River tributaries—Continued.
- Hoosic River at Buskirk, N. Y., 1903–1908.
- Mohawk River at Ridge Mills, near Rome, N. Y., 1898–1900.
- Mohawk River at Utica, N. Y., 1901–1903.
- Mohawk River at Little Falls, N. Y., 1898–1909; 1912.
- Mohawk River at Rocky Rift dam, near Indian Castle, N. Y., 1901.
- Mohawk River at Tribes Hill, N. Y., 1912.
- Mohawk River at Schenectady, N. Y., 1899–1901.
- Mohawk River at Rexford Flats, N. Y., 1898–1901.
- Mohawk River at Vischer Ferry dam, N. Y., 1913–
- Mohawk River at Dunsbach Ferry, N. Y., 1898–1909.
  - Ninemile Creek at Stittville, N. Y., 1898–99.
  - Oriskany Creek at Coleman, N. Y., 1904–1906.
  - Oriskany Creek at Wood-road bridge, near Oriskany, N. Y., 1901–1904.
  - Oriskany Creek at State dam, near Oriskany, N. Y., 1898–1900.
  - Saquoit Creek at New York Mills, N. Y., 1898–1900.
  - Nail Creek at Utica, N. Y., 1904.
  - Reels Creek near Deerfield, N. Y., 1901–1904.
  - Reels Creek at Utica, N. Y., 1901–2.
    - Johnson Brook at Deerfield, N. Y., 1903–1905.
  - Starch Factory Creek at New Hartford, N. Y., 1903–1906.
    - Graefenberg Creek at New Hartford, N. Y., 1903–1906.
    - Sylvan Glen Creek at New Hartford, N. Y., 1903–1906.
  - West Canada Creek at Wilmurt,N. Y., 1912–13.
  - West Canada Creek at Twin Rock bridge, near Trenton Falls, N. Y., 1900–1909.
  - West Canada Creek at Poland, N. Y., 1913.
  - West Canada Creek at Middleville, N. Y., 1898–1901.
  - West Canada Creek at Kast Bridge, N. Y., 1905–1909; 1912–13.
  - East Canada Creek at Dolgeville, N. Y., 1898–1909; 1912.
  - Caroga Creek 3 miles above junction with Mohawk River, N. Y., 1898–99.
  - Cayadutta Creek at Johnstown, N. Y., 1899–1900.
  - Schoharie Creek at Prattsville, N. Y., 1902–1913.
  - Schoharie Creek at Schoharie Falls, above Mill Point, N. Y., 1900–1901.
  - Schoharie Creek at Mill Point, N. Y., 1900–1903.
  - Schoharie Creek at Fort Hunter, N. Y., 1898–1901.
  - Schoharie Creek at Erie Canal aqueduct, below Fort Hunter, N. Y., 1900.
    - Alplaus Kill near Charlton, N. Y., 1913–1916.
- Quacken Kill at Quacken Kill, N. Y., 1894.
- Normans Kill at Frenchs Mill, N. Y., 1891.
- Kinderhook Creek at Wilsons dam, near Garfield, N. Y., 1892–1894.
- Kinderhook Creek at East Nassau, N. Y., 1892–1894.
- Kinderhook Creek at Rossman, N. Y., 1906–1909; 1911–1914.
- Catskill Creek at South Cairo, N. Y., 1901–1907.
- Esopus Creek at Olivebridge, N. Y., 1903–4.
- Esopus Creek near Olivebridge, N. Y., 1906–1913.
- Esopus Creek at Kingston, N. Y., 1901–1909.
- Esopus Creek at Mount Marion, N. Y., 1907–1913.
- Roundout Creek at Rosendale, N. Y., 1901–1903; 1906–1913.
  - Diversion to Delaware and Hudson Canal at Rosendale, N. Y., 1901–1903, 1906.
  - Wallkill River at Newpaltz, N. Y., 1901–1903.
- Wappinger Creek at Wappinger Falls, N. Y., 1903–1905.
- Fishkill Creek at Glenham, N. Y., 1901–1903.
- Foundry Brook at Cold Spring, N. Y., 1902–3.
- Croton River at Croton dam, near Croton Lake, N. Y., 1870–1899.

PASSAIC RIVER BASIN.

Passaic River at Millington, N. J., 1903–1906.
Passaic River near Chathan, N. J., 1902–1911.
Passaic River at Two Bridges (Mountain View), N. J., 1901–1903.
    Rockaway River at Boonton, N. J., 1903–4.
    Pompton River at Pompton Plains, N. J., 1903–4.
    Pompton River at Two Bridges (Mountain View), N. J., 1901–1903.
        Ramapo River near Mahwah, N. J., 1903–1906; 1908.
        Wanaque River at Wanaque, N. J., 1903–1905.

RARITAN RIVER BASIN.

Raritan River, South Branch (head of Raritan River), at Stanton, N. J., 1903–1906.
Raritan River at Finderne, N. J., 1903–1907.
Raritan River at Boundbrook, N. J., 1903–1909.
    North Branch of Raritan River at Pluckemin, N. J., 1903–1906.
    Millstone River at Millstone, N. J., 1903–4.

DELAWARE RIVER BASIN.

Delaware River, East Branch (head of Delaware River) at Fish Eddy, N. Y., 1912–
Delaware River, East Branch, at Hancock, N. Y., 1902-1912.
Delaware River at Port Jervis, N. Y., 1904–
Delaware River at Riegelsville, N. J., 1906–
Delaware River at Lambertville, N. J., 1897–1908.
    Beaver Kill at Cooks Falls, N. Y., 1913–
    West Branch of Delaware River at Hale Eddy, N. Y., 1912–
    West Branch of Delaware River at Hancock, N. Y., 1902–1912.
    Mongaup River near Rio, N. Y., 1909–1913.
    Neversink River at Godeffroy, N. Y., 1903; 1909–10; 1911–1914.
    Neversink River at Port Jervis, N. Y., 1902–3.
    Paulins Kill at Columbia, N. J., 1908–9.
    Lehigh River at South Bethlehem, Pa., 1902–1905; 1909–1913.
    Lehigh River at Easton, Pa., 1909.
    Musconetcong River at Asbury, N. J., 1903.
    Musconetcong River near Bloomsbury, N. J., 1903–1907.
    Tohickon Creek at Point Pleasant, Pa., 1883–1889; 1901–1913.
    Neshaminy Creek below Forks, Pa., 1884–1913.
    Schuylkill River near Philadelphia, Pa., 1898–1912.
        Perkiomen Creek near Frederick, Pa., 1884–1913.
        Wissahickon Creek near Philadelphia, Pa., 1897–1902; 1905–6.

SUSQUEHANNA RIVER BASIN.

Susquehanna River at Colliersville, N. Y., 1907–8.
Susquehanna River at Conklin, N. Y., 1912–
Susquehanna River at Binghamton, N. Y., 1901–1912.
Susquehanna River at Wysox, Pa., 1908–9.
Susquehanna River at Wilkes-Barre, Pa., 1899–1913.
Susquehanna River at Danville, Pa., 1899–1913.
Susquehanna River at Harrisburg, Pa., 1891–1913.
Susquehanna River at McCall Ferry, Pa., 1902–1909.
    Chenango River at South Oxford, N. Y., 1903.
    Chenango River near Greene, N. Y., 1908.
    Chenango River near Chenango Forks, N. Y., 1912–

Susquehanna River tributaries—Continued.
Chenango River at Binghamton, N. Y., 1901–1912.
Eaton Brook, Madison County, N. Y., 1835.
Madison Brook, Madison County, N. Y., 1835.
Tioughnioga River at Chenango Forks, N. Y., 1903.
Cayuta Creek at Waverly, N. Y., 1898–1902. (Data in Water-Supply Paper 109 only.)
Chemung River at Chemung, N. Y., 1903– (Data for period prior to 1905 published in Water-Supply Paper 109.)
West Branch of Susquehanna River at Williamsport, Pa., 1895–1913.
West Branch of Susquehanna River at Allenwood, Pa., 1899–1902.
Juniata River at Newport, Pa., 1899–1913.
Broad Creek at Mill Green, Md., 1905–1909.
Octoraro Creek at Rowlandsville, Md., 1896–1899.
Deer Creek near Churchville, Md., 1905–1909.

GUNPOWDER RIVER BASIN.

Gunpowder Falls at Glencoe, Md., 1905–1909.
Little Gunpowder Falls near Belair, Md., 1905–1909.

PATAPSCO RIVER BASIN.

Patapsco River at Woodstock, Md., 1896–1909.

PATUXENT RIVER BASIN.

Patuxent River near Burtonsville, Md., 1911–12; 1913–
Patuxent River at Laurel, Md., 1896–1898.

POTOMAC RIVER BASIN.

Potomac River North Branch (head of Potomac River), at Piedmont, W. Va., 1899–1906.
Potomac River, North Branch, at Cumberland, Md., 1894–1897.
Potomac River at Great Cacapon, W. Va., 1895.
Potomac River at Point of Rocks, Md., 1895–
Potomac River at Great Falls, Md., 1886–1891.
Potomac River at Chain Bridge, near Washington, D. C., 1892–1895.
Savage River at Bloomington, Md., 1905–6.
Georges Creek at Westernport, Md., 1905–6.
Wills Creek near Cumberland, Md., 1905–6.
South Branch of Potomac River near Springfield, W. Va., 1894–1896; 1899–1906.
Opequan Creek near Martinsburg, W. Va., 1905–6.
Tuscarora Creek at Martinsburg, W. Va., 1905.
Antietam Creek near Sharpsburg, Md., 1897–1905.
North River (head of South Fork of Shenandoah River, which is continuation of main stream) at Port Republic, Va., 1895–1899.
South Fork of Shenandoah River near Front Royal, Va., 1899–1906.
Shenandoah River at Millville, W. Va., 1895–1909.
Cooks Creek at Mount Crawford, Va., 1905–6.
Middle River:
Lewis Creek near Staunton, Va., 1905–6.
South River at Basic City, Va., 1905–6.
South River at Port Republic, Va., 1895–1899.
Elk Run at Elkton, Va., 1905–6.
Hawksbill Creek near Luray, Va., 1905–6.
North Fork of Shenandoah River near Riverton, Va., 1899–1906.

Potomac River tributaries—Continued.
Passage Creek at Buckton, Va., 1905–6.
Monocacy River near Frederick, Md., 1896–
Goose Creek near Leesburg, Va., 1909–1912.
Rock Creek at Zoological Park, D. C., 1897–1900.
Rock Creek at Lyons Mill, D. C., 1892–1894.
Occoquan Creek near Occoquan, Va., 1913–1916.

RAPPAHANNOCK RIVER BASIN.

Rappahannock River near Fredericksburg, Va., 1907–

REPORTS ON WATER RESOURCES OF NORTH ATLANTIC COAST.[1]

PUBLICATIONS OF UNITED STATES GEOLOGICAL SURVEY

WATER-SUPPLY PAPERS.

Water-supply papers are distributed free by the Geological Survey as long as its stock lasts. An asterisk (*) indicates that this stock has been exhausted. Many of the papers marked in this way may, however, be purchased (at price noted) from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C. Omission of the price indicates that the report is not obtainable from Government sources. Water-supply papers are of octavo size.

*24. Water resources of the State of New York, Part I, by G. W. Rafter. 1899. 99 pp., 13 pls. 15c.

Describes the principal rivers of New York and their more important tributaries, and gives data on temperature precipitation evaporation and stream flow.

*25. Water resources of the State of New York, Part II, by G. W. Rafter. 1899. 100 pp., 12 pls. 15c.

Contains discussion of water-storage projects on Genesee and Hudson rivers, power development at Niagara Falls, descriptions and early history of State canals, and a chapter on the use and value of the water power of the streams and canals; also brief discussion of the water yields of sand areas of Long Island.

*44. Profiles of rivers in the United States, by Henry Gannett. 1901. 100 pp., 11 pls. 15c.

Gives elevations and distances along rivers of the United States also brief descriptions of many of the streams, including St. Croix, Penobscot, Kennebec, Androscoggin, Saco, Merrimack, Connecticut, Housatonic, Hudson, Mohawk, Delaware, Lehigh, Schuylkill, Susquehanna, Juniata, Potomac, and James rivers.

*57. Preliminary list of deep borings in the United States, Part I (Alabama-Montana), by N. H. Darton. 1902. 60 pp. (See No. 149.) 5c.

*61. Preliminary list of deep borings in the United States, Part II (Nebraska-Wyoming), by N. H. Darton. 1902. 67 pp. 5c.

Nos. 57 and 61 contain information as to depth, diameter, yield, and head of water in borings more than 400 feet deep; under head "Remarks" give information concerning temperature, quality of water, purposes of boring, etc. The lists are arranged by States, and the States are arranged alphabetically. Revised edition published in 1905 as Water-Supply Paper 149 (q. v.).

*69. Water powers of the State of Maine, by H. A. Pressey. 1902. 124 pp., 14 pls. 20c.

Discusses briefly the geology and forests of Maine and in somewhat greater detail the drainage areas, lake storage, and water powers of the St. Croix, Penobscot, Kennebec, Androscoggin, Presumpscot, Saco, and St. John rivers, and the minor coastal streams; mentions also developed tidal powers.

72. Sewage pollution in the metropolitan area near New York City and its effect on inland water resources, by M. O. Leighton. 1902. 75 pp., 8 pls. 10c.

Defines "normal" and "polluted" waters and discusses the water of Raritan, Passaic, and Hudson rivers and their tributaries and the damage resulting from pollution.

76. Observations on the flow of rivers in the vicinity of New York City, by H. A. Pressey. 1903. 108 pp., 13 pls. 15c.

Describes methods of measuring stream flow in open channels and under ice, and the quality of the river water as determined by tests of turbidity, color, alkalinity, and permanent hardness. The streams considered are Catskill, Esopus, Rondout, and Fishkill creeks, and Wallkill, Tenmile, and Housatonic rivers.

79. Normal and polluted waters in northeastern United States, by M. O. Leighton. 1903. 192 pp. 10c.

Defines essential qualities of water for various uses, the impurities in rain, surface, and underground waters, the meaning and importance of sanitary analyses, and the principal sources of pollution; chiefly "a review of the more readily available records" of examination of water supplies derived from streams in the Merrimack, Connecticut, Housatonic, Delaware, and Ohio River basins; contains many analyses.

[1] For stream-measurement reports see tables on pages IV-V and VI.

88. The Passaic flood of 1902, by G. B. Hollister and M. O. Leighton. 1903. 56 pp., 15 pls. 15c.

Describes the topography of the area drained by the Passaic and its principal tributaries; discusses flood flow and losses caused by the floods, and makes comparison with previous floods; suggests construction of dam at Mountain View to control flood flow. See also No. 92.

92. The Passaic flood of 1903, by M. O. Leighton. 1904. 48 pp., 7 pls. 5c.

Discusses flood damages and preventive measures. See No. 88.

102. Contributions to the hydrology of eastern United States, 1903; M. L. Fuller, geologist in charge. 1904. 522 pp. 30c.

Contains brief reports on the wells and springs of the New England States and New York. The reports comprise tabulated well records giving information as to location, owner, depth, yield, head, etc., supplemented by notes as to elevation above sea, material penetrated, temperature, use, and quality; many miscellaneous analyses.

*103. A review of the laws forbidding pollution of inland waters in the United States, by E. B. Goodell. 1904. 120 pp. Superseded by 152.

Cites statutory restrictions of water pollution.

106. Water resources of the Philadelphia district, by Florence Bascom. 1904. 75 pp., 4 pls. 5c.

Describes the physiography, stratigraphic geology, rainfall, streams, ponds, springs, deep and artesian wells, and public water supplies of the area mapped on the Germantown, Norristown, Philadelphia, and Chester atlas sheets of the United States Geological Survey; compares quality of Delaware and Schuylkill River waters.

108. Quality of water in the Susquehanna River drainage basin, by M. O. Leighton, with an introductory chapter on physiographic features, by G. B. Hollister. 1904. 76 pp., 4 pls. 15c.

109. Hydrography of the Susquehanna River drainage basin, by J. C. Hoyt and R. H. Anderson. 1905. 215 pp., 29 pls. 25c.

The scope of No. 108 is sufficiently indicated by its title. No. 109 describes the physical features of the area drained by the Susquehanna and its tributaries, contains the results of measurements of flow at the gaging stations, and discusses precipitation, floods, low water, and water power.

110. Contributions to the hydrology of eastern United States, 1904; M. L. Fuller, geologist in charge. 1905. 211 pp., 5 pls. 10c.

Contains brief reports on water resources, surface and underground, of districts in the North Atlantic slope drainage basins, as shown by the following list:

Drilled wells of the Triassic area of the Connecticut Valley, by W. H. C. Pynchon.

Triassic rocks of the Connecticut Valley as a source of water supply, by M. L. Fuller. Scope indicated by title.

Water resources of the Taconic quadrangle, New York, Massachusetts, and Vermont, by F. B. Taylor. Discusses rainfall, drainage, water powers, lakes and ponds, underground waters, and mineral springs; also quality of spring water as indicated by chemical and sanitary analyses of Sand Spring, near Williamstown.

Water resources of the Watkins Glen quadrangle, New York, by Ralph S. Tarr. Discusses the use of the surface and underground waters for municipal supplies and their quality as indicated by examination of Sixmile and Fall creeks, and sanitary analyses of well water at Ithaca.

Water resources of the central and southwestern highlands of New Jersey, by Laurence La Forge. Treats of population, industries, climate, and soils, lakes, ponds, swamps and rivers, mineral springs (with analyses), water power, and the Morris Canal; present and prospective sources and quality of municipal supplies.

Water resources of the Chambersburg and Mercersburg quadrangles, Pennsylvania, by George W. Stose. Describes streams and springs.

Water resources of the Curwensville, Patton, Ebensburg, and Barnesboro quardangles, Pennsylvania, by F. G. Clapp. Treats briefly of surface and underground waters and their use for municipal supplies; gives analyses of waters at Cresson Springs.

Water resources of the Accident and Grantsville quadrangles, Maryland, by G. C. Martin.

Water resources of the Frostburg and Flintstone quadrangles, Maryland and West Virginia, by G. C Martin.

*114. Underground waters of eastern United States; M. L. Fuller, geologist in charge. 1905. 285 pp., 18 pls. 25c.

Contains brief reports on water supplies of the North Atlantic States as follows:
Maine, by W. S. Bayley.
New Hampshire, by M. L. Fuller.
Vermont, by G. H. Perkins.
Massachusetts and Rhode Island, by W. O. Crosby.
Connecticut, by H. E. Gregory.
New York, by F. B. Weeks.
New Jersey, by G. N. Knapp.
Pennsylvania, by M. L. Fuller.
Delaware, by N. H. Darton.
Maryland, by N. H. Darton and M. L. Fuller.
District of Columbia, by N. H. Darton and M. L. Fuller.
Virginia, by N. H. Darton and M. L. Fuller.

Each of these reports discusses the resources of the public and private water supplies and related subjects, and gives list of pertinent publications; mineral springs are listed and sales of mineral water are reported.

*122. Relation of the law to underground waters, by D. W. Johnson. 1905. 55 pp. 5c.

Cites legislative acts relating to ground waters in New Jersey.

140. Field measurements of the rate of movement of underground waters, by C. S. Slichter. 1905. 122 pp., 15 pls. 15c.

Contains chapter on measurement of rate of underflow on Long Island, N. Y.

144. The normal distribution of chlorine in the natural waters of New York and New England, by D. D. Jackson. 1905. 32 pp., 5 pls. 10c.

Discusses common salt in coast and inland waters, salt as an index to pollution of streams and wells, the solutions and methods used in chlorine determinations, and the use of the normas chlorine map; gives charts and tables for chlorine in the New England States and New York.

145. Contributions to the hydrology of eastern United States, 1905; M. L. Fuller, geologist in charge. 1905. 220 pp., 6 pls. 10c.

Contains several brief reports relating chiefly to areas in the North Atlantic coast drainage basins, as follows:

Water resources of the Portsmouth-York region, New Hampshire and Maine, by George Otis Smith. Gives results of investigations made for the War Department to determine water supplies available for forts at mouth of harbor.

Water supply from glacial gravels near Augusta, Maine, by George Otis Smith. Describes the Silver Lake system of ponds near Augusta and the series of springs at the head of Spring Brook.

Water resources of the Pawpaw and Hancock quadrangles, West Virginia, Maryland, and Pennsylvania, by George W. Stose and George C. Martin. Describes rocks, springs, and streams in the area at the northernmost bend of the Potomac; discusses history of development, character of water (with analysis), flow, and origin of Berkeley Springs.

Water of a gravel-filled valley near Tully, N. Y., by George B. Hollister. Describes character of the sands and gravels, the volume of the springs issuing from them, deposits of tufa, the waters of the lakes, and the composition of the spring and lake waters; analyses.

147. Destructive floods in United States in 1904, by E. C. Murphy and others. 206 pp., 18 pls. 15c.

Describes floods on Susquehanna and Mohawk rivers and near Johnstown, Pa.

*149. Preliminary list of deep borings in the United States, second edition, with additions, by N. H. Darton. 1905. 175 pp. 10c.

Gives by States (and within the States by counties), location, depth, diameter, yield, height of water, and other available information, concerning wells 400 feet or more in depth; includes all wells listed in Water-Supply Papers 57 and 61; mentions also principal publications relating to deep borings.

*152. A review of the laws forbidding pollution of inland waters in the United States (second edition), by E. B. Goodell. 1905. 149 pp. 10c.

Cites statutory restrictions of water pollution.

*155. Fluctuations of the water level in wells, with special reference to Long Island, New York, by A. C. Veatch. 1906. 83 pp., 9 pls. 25c.

Includes general discussion of fluctuation due to rainfall evaporation, barometric changes, temperature changes, changes in rivers, changes in lake level, tidal changes, effects of settlement, irrigation, dams, underground-water developments, and to indeterminate causes.

*162. Destructive floods in the United States in 1905, with a discussion of flood discharge and frequency and an index to flood literature, by E. C. Murphy and others. 1906. 105 pp., 4 pls. 15c.

Contains accounts of floods in North Atlantic slope drainage basins as follows: Flood on Poquonnock River, Connecticut, by T. W. Norcross; flood on the Unadilla and Chenango rivers, New York, by R. E. Horton and C. C. Covert; also estimates of flood discharge and frequency on Kennebec, Androscoggin, Merrimack, Connecticut, Hudson, Passaic, Raritan, Delaware, Susquehanna, and Potomac rivers; gives index to literature on floods on American streams.

*185. Investigations on the purification of Boston sewage, with a history of the sewage-disposal problem, by C.-E. A. Winslow and E. B. Phelps. 1906. 163 pp. 25c.

Discusses composition, disposal, purification, and treatment of sewage and sewage-disposal practice in England, Germany, and the United States; describes character of crude sewage at Boston, removal of suspended matter, treatment in septic tanks, and purification in intermittent sand filtration and coarse material; gives bibliography.

*192. The Potomac River basin (Geographic history; Rainfall and stream flow; Pollution, typhoid fever, and character of water; Relation of soils and forest cover to quality and quantity of surface water; Effect of industrial wastes on fishes), by H. N. Parker, Bailey Willis, R. H. Bolster, W. W. Ashe, and M. C. Marsh. 1907. 364 pp., 10 pls. 60c.

Scope indicated by title.

*198. Water resources of the Kennebec River basin, Maine, by H. K. Barrows, with a section on the quality of Kennebec River water, by G. C. Whipple. 1907. 235 pp., 7 pls. 30c.

Describes physical characteristics and geology of the basin, the flow of the streams, evaporation, floods, developed and undeveloped water powers, water storage, log driving, and lumbering; under quality of water discusses effect of tides, pollution, and the epidemic of typhoid fever in 1902–3; contains gazetteer of rivers, lakes, and ponds.

*223. Underground waters of southern Maine, by F. G. Clapp, with records of deep-wells, by W. S. Bayley. 1909. 268 pp., 24 pls. 55c.

Describes physiography, rivers, water-bearing rocks, amount, source, and temperature of the ground waters, recovery of waters by springs, collecting galleries and tunnels, and wells; discusses well-drilling methods, municipal water supplies, and the chemical composition of the ground waters; gives details for each county.

232. Underground-water resources of Connecticut, by H. E. Gregory, with a study of the occurrence of water in crystalline rocks, by E. E. Ellis. 1909. 200 pp., 5 pls. 20c.

Describes physiographic features, drainage, forests, climate, population and industries, and rocks; circulation, amount, temperature, and contamination of ground water; discusses the ground waters of the crystalline rocks, the Triassic sandstones and traps, and the glacial drift; the quality of the ground waters (with analyses); well construction; temperature, volume, character, uses, and production of spring waters.

236. The quality of surface waters in the United States, Part I, Analyses of waters east of the one hundredth meridian, by R. B. Dole. 1909. 123 pp. 10c.

Describes collection of samples, method of examination, preparation of solutions, accuracy of estimates, and expression of analytical results; gives results of analyses of waters of Androscoggin, Hudson, Raritan, Delaware, Susquehanna, Lehigh, Potomac, and Shenandoah rivers.

*258. Underground-water papers, 1910, by M. L. Fuller, F. G. Clapp, G. C. Matson, Samuel Sanford, and H. C. Wolff. 1911. 123 pp., 2 pls. 15c.

Contains four brief reports pertaining especially to districts in the North Atlantic coast drainage areas:

Occurrence and composition of well waters in the slates of Maine, by F. G. Clapp. Analyses.
Occurrence and composition of well waters in the granites of New England, by F. G. Clapp Discusses proportion of successful wells and water supply and depth. Analyses.
Composition of mineral springs in Maine, by F. G. Clapp.
Saline artesian waters of the Atlantic Coastal Plain, by Samuel Sanford.
Underground waters near Manassas, Va., by F. G. Clapp.

279. Water resources of the Penobscot River basin, Maine, by H. K. Barrows and C. C. Babb. 1912. 285 pp., 19 pls. 65c.

Describes the topography, drainage, geology, forests, population, industries, transportation lines, and precipitation in the basin; gives results of investigations of stream flow at gaging stations; discusses relation of run-off to precipitation, evaporation, floods, low water, developed, and undeveloped water powers, storage, log driving, and lumbering; contains gazetteer of rivers, lakes, and ponds.

374. Ground water in the Hartford, Stamford, Salisbury, Willimantic, and Saybrook areas, Connecticut, by H. E. Gregory and A. J. Ellis. 1916. 150 pp., 13 pls. 30c.

Describes occurrence of ground water, methods of developing, and requirements for municipal use. Gives, by towns, a description of the surface and ground water and of the public water supply, and records of wells and springs.

*397. Ground water in the Waterbury area, Connecticut, by A. J. Ellis, under direction of H. E. Gregory. 1916. 73 pp., 4 pls. 15c.

Describes the geology of the area, the occurrence of ground water, its use for private and municipal supply, and methods of developing. Discusses under towns the population and industries, topography, water-bearing formations, surface and ground water, and public supplies, and gives records of wells and springs.

415. Surface waters of Massachusetts, by C. H. Pierce and H. J. Dean. 1916. 433 pp., 12 pls. 45c.

A compilation of available stream-flow data, including the classic records collected on the Merrimack at Lowell and Lawrence, on the Connecticut at Holyoke, and on the Cochituate at Sudbury by the Metropolitan Water and Sewerage Board, as well as records covering shorter periods; prepared in cooperation with the Commonwealth of Massachusetts. Contains a gazetteer of streams, lakes, and ponds.

424. Surface waters of Vermont, by C. H. Pierce. 1917. 218 pp., 14 pls.

A compilation of available stream-flow data; prepared in cooperation with the Commonwealth of Vermont. Contains a gazetteer of streams, lakes, and ponds.

ANNUAL REPORTS.

Each of the papers contained in the annual reports was also issued in separate form.

Annual reports are distributed free by the Geological Survey as long as its stock lasts. An asterisk (*) indicates that this stock has been exhausted. Many of the papers so marked, however, may be purchased from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

*Sixth Annual Report of the United States Geological Survey, 1884–85, J. W. Powell, Director. 1885. xxix, 570 pp., 65 pls. Cloth $2.00 Contains:

* Seacost swamps of the eastern United States, by N. S. Shaler. pp. 353–398. Describes the coast swamps of New England; discusses economic problems connected with marine swamps; gives a detailed account of selected areas of salt marsh lands, and a list of the principal areas of salt marshes between the Hudson River and Portland, Maine.

*Tenth Annual Report of the United States Geological Survey, 1888–89, J. W. Powell, Director. 1890. 2 parts. *Pt. I—Geology, xv, 774 pp., 98 pls. Cloth $2.35 Contains:

* General account of the fresh-water morasses of the United States, with a description of the Dismal Swamp district of Virginia and North Carolina, by N. S. Shaler, pp. 255–339, Pls. 6 to 19. Scope indicated by title.

Fourteenth Annual Report of the United States Geological Survey, 1892–93, J. W. Powell, Director. 1893. (Pt. II, 1894.) 2 parts. *Pt. II.—Accompanying papers, xx, 597 pp., 73 pls. Cloth $2.10. Contains:

* The potable waters of the eastern United States, by W. J. McGee, pp. 1 to 47. Discusses cistern water, stream waters, and ground waters, including mineral springs and artesian wells.

364. Water analyses from the laboratory of the United States Geological Survey, tabulated by F. W. Clarke, chief chemist. 1914. 40 pp.

Contains analyses of spring and well waters in Maine, District of Columbia, and Virginia.

PROFESSIONAL PAPERS.

Professional papers are distributed free by the Geological Survey as long as its stock lasts. An asterisk (*) indicates that this stock has been exhausted. Many of the papers marked with an asterisk may, however, be purchased from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C. Professional papers are of quarto size.

*44. Underground-water resources of Long Island, N. Y., by A. C. Veatch, C. S. Slitcher, Isaiah Bowman, W. O. Crosby, and R. E. Horton. 1906. 394 pp., 34 pls. $1.25.

Describes the geologic formations, the source of the ground waters, and requsite conditions for flowing wells; the springs, streams, ponds, and lakes; artesian and deep wells; fluctuation of ground-water table; blowing wells; waterworks; discusses measurements of velocity of underflow, the results of sizing and filtration tests, and the utilization of stream waters; gives well records and notes (with chemical analyses) concerning representative wells.

BULLETINS.

An asterisk (*) indicates that the Geological Survey's stock of the paper is exhausted. Many of the papers so marked may be purchased from the SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

*138. Artesian well prospects in the Atlantic Coastal Plain region, by N. H. Darton. 1896. 232 pp., 19 pls.

Describes the general geologic structure of the Atlantic Coastal Plain region and summarizes the conditions affecting subterranean water in the Coastal Plain; discusses the general geological relations in New York, southern New Jersey, Delaware, Maryland, District of Columbia, Virginia, North Carolina, South Carolina, and eastern Georgia; gives for each of the States a list of the deep wells and discusses well prospects. The notes on the wells that follows the tabulated lists contain many well sections and analyses of the waters.

*264. Record of deep well drilling for 1904, by M. L. Fuller, E. F. Lines, and A. C. Veatch. 1905. 106 pp. 10c.

Discusses the importance of accurate well records to the driller, to owners of oil, gas, and water wells, and to the geologist; describes the general methods of work; gives tabulated records of wells in Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Virginia, and detailed records of wells at Pleasantville and Atlantic Highlands, N. J., and Tully, N. Y. These wells were selected because they give definite stratigraphic information.

*298. Record of deep well drilling for 1905, by M. L. Fuller and Samuel Sanford, 1906. 299 pp. 25c.

Gives an account of progress in the collection of well records and samples; contains tabulated records of wells in Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, and Virginia, and detailed records of wells in Newcastle County, Del.; Cumberland County, Maine; Anne Arundel, St. Mary, and Talbot counties, Md.; Hampshire County, Mass.; Monmouth County, N. J.; Saratoga County, N. Y.; and Lycoming and Somerset counties, Pa. The wells of which detailed sections are given were selected because they afford valuable stratigraphic information.

*531. Contributions to economic geology, 1911, Part II, Mineral fuels; M. R. Campbell, geologist in charge. 1913. 361 pp., 24 pls. 45c.

Issued also in separate chapters. The following papers contain information on ground water: *(d) Geologic structure of the Punxsutawney, Curwensville, Houtzdale, Barnesboro, and Patton quadrangles, central Pennsylvania, by G. H. Ashley, and M. R. Campbell (pp. 69-89, Pls. VII-VIII). Discusses the geologic structure of the five quadrangles named and includes a map showing structure contours. It contains a brief statement in regard to shallow and deep wells and artesian prospects (pp. 88-89). The ground water in the Barnesboro and Patton quadrangles is also briefly described in Geologic Folio 189, and the ground water in these two quadrangles and in the Curwensville quadrangle is briefly described in Water Supply Paper 110.

GEOLOGIC FOLIOS.

Under the plan adopted for the preparation of a geologic map of the United States the entire area is divided into small quadrangles, bounded by certain meridians and parallels, and these quadrangles, which number several thousand, are separately surveyed and mapped.[1] The unit of survey is also the unit of publication, and the

[1] Index maps showing areas in the North Atlantic slope basins covered by topographic maps and by geologic folios will be mailed on receipt of request addressed to the Director, U. S. Geological Survey, Washington, D. C.

maps and description of each quadrangle are issued in the form of a folio. When all the folios are completed they will constitute the Geologic Atlas of the United States.

A folio is designated by the name of the principal town or of a prominent natural feature within the quadrangle. Each folio includes maps showing the topography, geology, underground structure, and mineral deposits of the area mapped and several pages of descriptive text. The text explains the maps and describes the topographic and geologic features of the country and its mineral products. The topographic map shows roads, railroads, waterways, and, by contour lines, the shapes of the hills and valleys and the height above sea level of all points in the quadrangle. The areal-geology map shows the distribution of the various rocks at the surface. The structural-geology map shows the relations of the rocks to one another underground. The economic-geology map indicates the location of mineral deposits that are commercially valuable. The artesian-water maps show the depth to underground-water horizons. Economic-geology and artesian-water maps are included in folios if the conditions in the areas mapped warrant their publication. The folios are of special interest to students of geography and geology and are valuable as guides in the development and utilization of mineral resources.

Folios 1 to 163, inclusive, are published in only one form (18 by 22 inches), called the library edition. Some of the folios that bear numbers higher than 163 are published also in an octavo edition (6 by 9 inches). Owing to a fire in the Geological Survey building May 18, 1913, the stock of geologic folios was more or less damaged by fire and water, but the folios that are usable are sold at the uniform price of 5 cents each, with no reduction for wholesale orders. This rate applies to folios in stock from 1 to 184, inclusive (except reprints), also to the library edition of Folio 186. The library edition of Folios 185, 187, and higher numbers sells for 25 cents a copy, except that some folios which contain an unusually large amount of matter sell at higher prices. The octavo edition of Folio 185 and higher numbers sells for 50 cents a copy, except Folio 193, which sells for 75 cents a copy. A discount of 40 per cent is allowed on an order for folios, or for folios together with topographic maps, amounting to $5, or more at the retail rate.

All the folios contain descriptions of the drainage of the quadrangles. The folios in the following list contain also brief discussions of the underground waters in connection with the economic resources of the areas and more or less information concerning the utilization of the water resources.

An asterisk (*) indicates that the stock of the folio is exhausted.

*13. Fredericksburg, Virginia-Maryland. 1894. 5c.

23. Nomini, Maryland-Virginia. 1896. 5c.

*70. Washington, District of Columbia-Maryland-Virginia. 1901.

*83. New York City (Paterson, Harlem, Staten Island, and Brooklyn quadrangles), New York-New Jersey. 1902.

Discusses the present and future water supply of New York City.

136. St. Marys, Maryland-Virginia. 1906. 5c.

Discusses artesian wells.

*137. Dover, Delaware-Maryland-New Jersey. 1906. 5c.

Describes the shallow and deep wells used as sources of water suppy; gives section of well at Middletown, Del.

*149. Penobscot Bay, Maine. 1907. 5c.

Describes the wells and springs; gives analysis of spring water from North Bluehill.

152. Patuxent, Maryland-District of Columbia. 1907. 5c.

Discusses the springs, shallow wells, and artesian wells.

*157. Passaic, New Jersey-New York. 1908.

Discusses the underground water of the quadrangle, including the cities of Newark, Hoboken, Jersey City, Paterson, Elizabeth, Passaic, Plainfield, Rahway, and Perth Amboy, and a portion of the City of New York; gives a list of the deep borings in the New Jersey portion of the quadrangle, and notes concerning wells on Staten Island, Long Island, Hoffman Island, and Governors Island.

158. Rockland, Maine. 1908. 5c.

Describes the water supply in Knox County, Maine, of which Rockland is the principal city; discusses the water obtained from wells drilled in limestone and granite, and the city water supply of Camden, Rockport, Rockland, and Thomaston.

*160. Accident-Grantville, Maryland-Pennsylvania-West Virginia. 1908. 5c.

Under "Mineral Resources" the folio describes Youghiogheny and Castleman rivers, Savage River, and Georges Creek, and the spring waters; notes possibility of obtaining artesian water.

*161. Franklin Furnace, New Jersey. 1908.

Describes the streams, water powers, and ground waters of a district in northwestern New Jersey, mainly in Sussex County but including also a small part of Morris County; gives tabulated list of water powers and of bored wells.

*162. Philadelphia (Norristown, Germantown, Chester, and Philadelphia quadrangles), Pennsylvania-New Jersey-Delaware. 1909.

Discusses the water supply of Philadelphia and Camden, also suburban towns; gives analysis of filtered water of Pickering Creek.

*167. Trenton, New Jersey-Pennsylvania.[1] 1909. 5c.

Describes streams tributary to Raritan and Delaware rivers (including estimates of capacity with and without storage) and the springs and wells; discusses also the public water supply of Trenton and suburban towns.

*169. Watkins Glen-Catatonk, New York. 1909. 5c.

Describes springs and shallow and deep wells; discusses also water supply at Ithaca.

170. Mercersburg-Chambersburg, Pennsylvania.[2] 1909. 5c.

Describes springs and wells and mentions sources of water supplies of principal towns.

179. Pawpaw-Hancock, West Virginia-Maryland-Pennsylvania. 1912. 5c.

Gives analysis of water of Berkeley Springs.

182. Choptank, Maryland. 1912.[2] 5c.

The Choptank quadrangle includes the entire width of Chesapeake Bay and portions of many large estuaries.

189. Barnesboro-Patton, Pennsylvania. 1913. 25c.

Discusses the water supply of various towns in the quadrangle.

191. Raritan, New Jersey.[3] 1914.

Discusses briefly the surface and ground waters of the quadrangle, the quality, and the utilization of streams for power; gives analysis of water from Raritan River and from Schooley Mountain Spring near Hackettstown.

192. Eastport, Maine. 1914. 25c.

Includes brief account of the water supply of the quadrangle and of the utilization of streams for power.

204. Tolchester, Maryland. 1917. 25c.

Discusses shallow and artesian wells.

---

[1] Octavo edition only.

[2] Issued in two editions—library (18 by 22 inches) and octavo (6 by 9 inches). Specify edition desired.

MISCELLANEOUS REPORTS.

Other Federal bureaus and State and other organizations have from time to time published reports relating to the water resources of various sections of the country. Notable among those pertaining to the North Atlantic States are the reports of the Main State Water Storage Commission (Augusta), the New Hampshire Forestry Commission (Concord), the Metropolitan Water and Sewerage Board (Boston, Mass.), the New York State Water-Supply Commission (Albany), the New York State Conservation Commission (Albany), the New York State engineer and surveyor (Albany), the various commissions on water supply of New York City, the Geological Survey of New Jersey (Trenton), State boards of health, and the Tenth Census (vol. 16).

The following reports deserve special mention:

Water power of Maine, by Walter Wells, Augusta, 1869.

Hydrology of the State of New York, by G. W. Rafter: New York State Museum Bull. 85, 1905.

Hydrography of Virginia, by N. C. Grover and R. H. Bolster: Virginia Geol. Survey Bull. 3, 1906.

Underground-water resources of the Coastal Plain province of Virginia, by Samuel Stanford: Virginia Geol. Survey Bull. 5, 1913.

Surface water supply of Virginia, by G. C. Stevens: Virginia Geol. Survey Bull. 19, 1916.

Many of these reports can be obtained by applying to the several commissions, and most of them can be consulted in the public libraries of the larger cities.

GEOLOGICAL SURVEY HYDROLOGIC REPORTS OF GENERAL INTEREST.

The following list comprises reports that are not readily classifiable by drainage basins and that cover a wide range of hydrologic investigations:

WATER-SUPPLY PAPERS.

*1. Pumping water for irrigation, by H. M. Wilson. 1896. 57 pp., 9 pls.
Describes pumps and motive powers, windmills, water wheels, and various kinds of engines; also storage reservoirs to retain pumped water until needed for irrigation.

*3. Sewage irrigation, by G. W. Rafter. 1897. 100 pp., 4 pls. 10c. (See Water-Supply Paper 22.)
Discusses methods of sewage disposal by intermittent filtration and by irrigation; describes utilization of sewage in Germany, England, and France, and sewage purification in the United States.

*8. Windmills for irrigation, by E. C. Murphy. 1897. 49 pp., 8 pls. 10c.
Gives results of experimental tests of windmills during the summer of 1896 in the vicinity of Garden, Kans.; describes instruments and methods and draws conclusions.

*14. New tests of certain pumps and water lifts used in irrigation, by O. P. Hood. 1898. 91 pp., 1 pl. 10c.
Discusses efficiency of pumps and water lifts of various types.

*20. Experiments with windmills, by T. O. Perry. 1899. 97 pp., 12 pls. 15c.
Includes tables and descriptions of wind wheels, compares wheels of several types, and discusses results.

*22. Sewage irrigation, Part II, by G. W. Rafter. 1899. 100 pp., 7 pls. 15c.
Gives résumé of Water-Supply Paper No. 3; discusses pollution of certain streams, experiments on purification of factory wastes in Massachusetts, value of commercial fertilizers, and describes American sewage-disposal plants by States; contains bibliography of publications relating to sewage utilization and disposal.

*41. The windmill: Its efficiency and economic use, Part I, by E. C. Murphy. 1901. 72 pp., 14 pls.

*42. The windmill: Its efficiency and economic use, Part II, by E. C. Murphy. 1901. 75 pp., 2 pls. 10c.
Nos. 41 and 42 give details of results of experimental tests with windmills of various types.

*43. Conveyance of water in irrigation canals, flumes, and pipes, by Samuel Fortier. 1901. 86 pp., 15 pls. 15c.

*56. Methods of stream measurement. 1901. 51 pp., 12 pls. 15c.
Describes the methods used by the Survey in 1901-2. See also Nos. 64, 94, and 95.

*64. Accuracy of stream measurements, by E. C. Murphy. 1902. 99 pp., 4 pls. (See No. 95.) 10c.
Describes methods of measuring velocity of water and of measuring and computing stream flow and compares results obtained with the different instruments and methods; describes also experiment and results at the Cornell University hydraulic laboratory. A second, enlarged edition published as Water-Supply Paper 95.

*67. The motions of underground waters, by C. S. Slichter. 1902. 106 pp., 8 pls. 15c.
Discusses origin, depth, and amount of underground waters; permeability of rocks and porosity of soils; causes, rates, and laws of motions of underground water; surface and deep zones of flow, and recovery of waters by open wells and artesian and deep wells; treats of the shape and position of the water table; gives simple methods of measuring yield of flowing wells; describes artesian wells at Savannah, Ga.

*80. The relation of rainfall to run-off, by G. W. Rafter. 1903. 104 pp. 10c.
Treats of measurements of rainfall and laws and measurements of stream flow; gives rainfall run-off, and evaporation formulas; discusses effect of forests on rainfall and run-off.

87. Irrigation in India (second edition), by H. M. Wilson. 1903. 238 pp., 27 pls. 25c.
First edition was published in Part II of the Twelfth Annual Report.

93. Proceedings of first conference of engineers of the Reclamation Service, with accompanying papers, compiled by F. H. Newell, chief engineer. 1904. 361 pp. 25c. [Requests for this report should be addressed to the U. S. Reclamation Service.]
Contains the following papers of more or less general interest:
Limits of an irrigation project, by D. W. Ross.
Relation of Federal and State laws to irrigation, by Morris Bien.
Electrical transmission of power for pumping, by H. A. Storrs.
Correct design and stability of high masonry dams, by Geo. Y. Wisner.
Irrigation surveys and the use of the plane table, by J. B. Lippincott.
The use of alkaline waters for irrigation, by Thomas H. Means.

*94. Hydrographic manual of the United States Geological Survey, prepared by E. C. Murphy, J. C. Hoyt, and G. B. Hollister. 1904. 76 pp., 3 pls. 10c.
Gives instruction for field and office work relating to measurements of stream flow by current meters. See also No. 95.

*95. Accuracy of stream measurements (second enlarged edition), by E. C. Murphy. 1904. 169 pp., 6 pls.
Describes methods of measuring and computing stream flow and compares results derived from different instruments and methods. See also No. 94.

*103. A review of the laws forbidding pollution of inland waters in the Unites States, by E. B. Goodell. 1940. 120 pp. (See No. 152.)
Explains the legal principles under which antipollution statutes become operative, quotes court decisions to show authority for various deductions, and classifies according to scope the statutes enacted in the different States.

110. Contributions to the hydrology of eastern United States, 1904; M. L. Fuller, geologist in charge. 1905. 211 pp., 5 pls. 10c.
Contains the following reports of general interest. The scope of each paper is indicated by its title.
Description of underflow meter used in measuring the velocity and direction of underground water, by Charles S. Slichter.
The California or "stovepipe" method of well construction, by Charles S. Slichter.
Approximate methods of measuring the yield of flowing wells, by Charles S. Slichter.
Corrections necessary in accurate determinations of flow from vertical well casings, from notes furnished by A. N. Talbot.
Experiments relating to problems of well contamination as Quitman, Ga., by S. W. McCallie.

113. The disposal of strawboard and oil-well wastes, by R. L. Sackett and Isaiah Bowman. 1905. 52 pp., 4 pls. 5c.
The first paper discusses the pollution of streams by sewage and by trade wastes, descripes the manufacture of strawboard, and gives results of various experiments in disposing of the waste. The second paper describes briefly the topography, drainage, and geology of the region about Marion, Ind., and the contamination of rock wells and of streams by waste oil and brine.

*114. Underground waters of eastern United States; M. L. Fuller, geologist in charge. 1905. 285 pp., 18 pls. 25c.
Contains report on "Occurrence to underground waters," by M. L. Fuller, discussing sources, amount, and temperature of waters, permeability and storage capacity of stocks, water-bearing formations, recovery of water by springs, well, and pumps, essential condition of artesian flows and general conditions affecting underground waters in eastern United States.

115. River surveys and profiles made during 1903, arranged by W. C. Hall and J. C. Hoyt. 1905. 115 pp., 4 pls. 10c.
Contains results of survey made to determine location of undeveloped power sites.

119. Index to the hydrographic progress reports of the United States Geological Survey, 1888 to 1903, by J. C. Hoyt and B. D. Wood. 1905. 253 pp. 15c.
Scope indicated by title.

120. Bibliographic review and index of papers relating to underground waters published by the United States Geological Survey, 1879–1904, by M. L. Fuller. 1905. 128 pp. 10c.

Scope indicated by title.

*122. Relation of the law to underground waters, by D. W. Johnson. 1905. 55 pp. 5c.

Defines and classifies underground waters, gives common-law rules relating to their use, and cites State legislative acts affecting them.

140. Field measurements of the rate of movement of underground waters, by C. S. Slichter. 1905. 122 pp., 15 pls. 15c.

Discusses the capacity of sand to transmit water, describes measurements of underflow in Rio Hondo, San Gabriel, and Mohave River valleys, Calif., and on Long Island, N. Y.; gives results of tests of wells and pumping plants, and describes stovepipe method of well construction.

143. Experiments on steel-concrete pipes on a working scale, by J. H. Quinton. 1905. 61 pp., 4 pls.

Scope indicated by title.

145. Contributions to the hydrology of eastern United States, 1905; M. L. Fuller, geologist in charge. 1905. 220 pp., 6 pls. 10c.

Contains brief reports of general interest as follows:

Drainage of ponds into drilled wells, by Robert E. Horton. Discusses efficiency, cost, and capacity of drainage wells, and gives statistics of such wells in southern Michigan.

Construction of so-called fountain and geyser springs, by Myron L. Fuller.

A convenient gage for determining low artesian heads, by Myron L. Fuller.

146. Proceedings of second conference of engineers of the Reclamation Service, with accompanying papers, compiled by F. H. Newell, chief engineer. 1905. 267 pp. 15c.

Contains brief account of the organization of the hydrographic [water-resources] branch and the Reclamation Service, reports of conferences and committees, circulars of instruction, and many brief reports on subjects closely related to reclamation, and a bibliography of technical papers by members of the service. Of the papers read at the conference those listed below (scope indicated by title) are of more or less general interest:

Proposed State code of water laws, by Morris Bien.
Power engineering applied to irrigation problems, by O. H. Ensign.
Estimates on tunneling in irrigation projects, by A. L. Fellows.
Collection of stream-gaging data, by N. C. Grover.
Diamond-drill methods, by G. A. Hammond.
Mean-velocity and area curves, by F. W. Hanna.
Importance of general hydrographic data concerning basins of streams gaged, by R. E. Horton.
Effect of aquatic vegetation on stream flow, by R. E. Horton.
Sanitary regulations governing construction camps, by M. O. Leighton.
Necessity of draining irrigated land, by Thos. H. Means.
Alkali soils, by Thos. H. Means.
Cost of stream-gaging work, by E. C. Murphy.
Equipment of a cable gaging station, by E. C. Murphy.
Silting of reservoirs, by W. M. Reed.
Farm-unit classification, by D. W. Ross.
Cost of power for pumping irrigating water, by H. A. Storrs.
Records of flow at current-meter gaging stations during the frozen season, by F. H. Tillinghast.

147. Destructive floods in United States in 1904, by E. C. Murphy and others. 206 pp., 18 pls. 15c.

Contains a brief account of "A method of computing cross-section area of waterways," including formulas for maximum discharge and area of cross section.

*150. Weir experiments, coefficients, and formulas, by R. E. Horton. 1906. 189 pp., 38 pls. (See Water-Supply Paper 200.) 15c.

Scope indicated by title.

151. Field assay of water, by M. O. Leighton. 1905. 77 pp., 4 pls. 10c.

Discusses methods, instruments, and reagents used in determining turbidity, color, iron, chlorides, and hardness, in connection with studies of the quality of water in various parts of the United States.

*152. A review of the laws forbidding pollution of inland waters in the United States (second edition), by E. B. Goodell. 1905. 149 pp. 10c.
Scope indicated by title.

*160. Underground-water papers, 1906; M. L. Fuller, geologist in charge. 1906. 104 pp., 1 pl.
Gives account of work in 1905, lists of publications relating to underground waters, and contains the following brief reports of general interest:
Significance of the term "artesian," by Myron L. Fuller.
Representation of wells and springs on maps, by Myron L. Fuller.
Total amount of free water in the earth's crust, by Myron L. Fuller.
Use of fluorescein in the study of underground waters, by R. B. Dole.
Problems of water contamination, by Isaiah Bowman.
Instances of improvement of water in wells, by Myron L. Fuller.

*162. Destructive floods in the United States in 1905, with a discussion of flood discharge and frequency and an index to flood literature, by E. C. Murphy and others. 1906. 105 pp., 4 pls. 15c.

*163. Bibliographic review and index of underground-water literature published in the United States in 1905, by M. L. Fuller, F. G. Clapp, and B. L. Johnson. 1906. 130 pp. 15c.
Scope indicated by title.

*179. Prevention of stream pollution by distillery refuse, based on investigations at Lynchburg, Ohio, by Herman Stabler. 1906. 34 pp., 1 pl. 10c.
Describes grain distillation, treatment of slop, sources, character, and effects of effluent on streams; discusses filtration, precipitation, fermentation, and evaporation methods of disposal of wastes without pollution.

*180. Turbine water-wheel tests and power tables, by R. E. Horton. 1906. 134 pp. 2 pls. 20c.
Scope indicated by title.

*186. Stream pollution by acid-iron wastes, a report based on investigations made at Shelby, Ohio, by Herman Stabler. 1906. 36 pp., 1 pl.
Gives history of pollution by acid-iron wastes at Shelby, Ohio, and resulting litigation; discusses effect of acid-iron liquors on sewage purification processes, recovery of copperas from acid-iron wastes, and other processes for disposal of pickling liquor.

*187. Determination of stream flow during the frozen season, by H. K. Barrows and R. E. Horton. 1907. 93 pp., 1 pl. 15c.
Scope indicated by title.

*189. The prevention of stream pollution by strawboard waste, by E. B. Phelps. 1906. 29 pp., 2 pls. 5c.
Describes manufacture of strawboard, present and proposed methods of disposal of waste liquors, laboratory investigations of precipitation and sedimentation, and field studies of amounts and character of water used, raw material and finished product, and mechanical filtration.

*194. Pollution of Illinois and Mississippi rivers by Chicago sewage (a digest of the testimony taken in the case of the State of Missouri *v.* the State of Illinois and the Sanitary district of Chicago), by M. O. Leighton. 1907. 369 pp., 2 pls. 40c.
Scope indicated by amplification of title.

*200. Weir experiments, coefficients, and formulas (revision of paper No. 150), by R. E. Horton. 1907. 195 pp., 38 pls. 35c.
Scope indicated by title.

*226. The pollution of streams by sulphite pulp waste, a study of possible remedies, by E. B. Phelps. 1909. 37 pp., 1 pl. 10c.
Describes manufacture of sulphite pulp, the waste liquors, and the experimental work leading to suggestions as to methods of preventing stream pollution.

*229. The disinfection of sewage and sewage filter effluents, with a chapter on the putrescibility and stability of sewage effluents, by E. B. Phelps. 1909. 91 pp., 1 pl. 15c.
Scope indicated by title.

*234. Papers on the conservation of water resources. 1909. 96 pp., 2 pls. 15c.
Contains the following papers, whose scope is indicated by their titles: Distribution of rainfall, by Henry Gannett; Floods, by M. O. Leighton; Developed water powers, compiled under the direction of W. M. Steuart, with discussion by M. O. Leighton; Undeveloped water powers by M. O. Leighton; Irrigation, by F. H. Newell; Underground waters, by W. C. Mendenhall, Denudation, by R. B. Dole and Herman Stabler; Control of catchment areas, by H. N. Parker

*235. The purification of some textile and other factory wastes, by Herman Stabler and G. H. Pratt. 1909. 76 pp. 10c.
Discusses waste waters from wool scouring, bleaching and dyeing cotton yarn, bleaching cotton piece goods. and manufacture of oleomargine, fertilizer, and glue.

236. The quality of surface waters in the United States, Part I.—Analyses of waters east of the one hundredth meridian, by R. B. Dole. 1909. 123 pp. 10c.
Describes collection of samples, methods of examination, preparation of solutions, accuracy of estimates, and expression of analytical results.

238. The public utility of water powers and their governmental regulation, by René Tavernier and M. O. Leighton. 1910. 161 pp. 15c.
Discusses hydraulic power and irrigation, French, Italian, and Swiss legislation relative to the development of water powers, and laws proposed in the French parliament; reviews work of bureau of hydraulics and agricultural improvement of the French department of agriculture, and gives résumé of Federal and State water-power legislation in the United States.

*255. Underground waters for farm use, by M. L. Fuller. 1910. 58 pp., 17 pls. 15c.
Discusses rocks as sources of water supply and the relative safety of supplies from different materials; springs and their protection; open or dug and deep wells, their location, yield, relative cost, protection, and safety; advantages and disadvantages of cisterns and combination wells and cisterns.

*257. Well-drilling methods, by Isaiah Bowman. 1911. 139 pp., 4 pls. 15c.
Discusses amount, distribution, and disposal of rainfall, water-bearing rocks, amount of underground water and artesian conditions, and oil and gas bearing formations; gives history of well drilling in Asia, Europe, and the United States; describes in detail the various method and the machinery used; discusses loss of tools and geologic difficulties; contamination of well waters and methods of prevention; tests of capacity and measurement of depth; and costs of sinking wells.

*258. Underground-water papers, 1910, by M. L. Fuller, F. G. Clapp, G. C. Matson, Samuel Sanford, and C. H. Wolff. 1911. 123 pp., 2 pls. 15c.
Contains the following papers (scope indicated by titles) of general interest:
Drainage by wells, by M. L. Fuller.
Freezing of wells and related phenomena, by M. L. Fuller.
Pollution of underground waters in limestone, by G. C. Matson.
Protection of shallow wells in sandy deposits, by M. L. Fuller.
Magnetic wells, by M. L. Fuller.

259. The underground waters of southwestern Ohio, by M. L. Fuller and F. G. Clapp, with a discussion of the chemical character of the waters, by R. B. Dole. 1912. 228 pp., 9 pls. 35c.
Describes the topography, climate, and geology of the region, the water-bearing formations the source, mode of occurrence, and head of the waters, and municipal supplies; gives details by counties; discusses in supplement, under chemical character, method of analysis and expression of results, mineral constituents, effect of the constituents on waters for domestic, industrial, or medicinal uses, methods of purification, and chemical composition; many analyses and field assays. The matter in the supplement was also published in Water-Supply Paper 254 (The underground waters of north-central Indiana).

274. Some stream waters of the western United States, with chapters on sediment carried by the Rio Grande and the industrial application of water analyses, by Herman Stabler. 1911. 188 pp. 15c.
Describes collection of samples, plan of analytical work, and methods of analyses; discusses soap-consuming power of waters, water softening, boiler waters, and water for irrigation.

280. Gaging stations maintained by the United States Geological Survey, 1888-1910, and Survey publications relating to water resources, compiled by B. D. Wood. 1912. 102 pp. 10c.

*315. The purification of public water supplies, by G. A. Johnson. 1913. 84 pp., 8 pls. 10c.

Discusses ground, lake, and river waters as public supplies, development of waterworks systems in the United States, water consumption, and typhoid fever; describes methods of filtration and sterilization of water and municipal water softening.

334. The Ohio Valley flood of March–April, 1913 (including comparisons with some earlier floods), by A. H. Horton and H. J. Jackson. 1913. 96 pp., 22 pls. 20c.

Although relating specifically to floods in the Ohio Valley, this report discusses also the causes of floods and the prevention of damage by floods.

337. The effects of ice on stream flow, by William Glenn Hoyt. 1913. 77 pp., 7 pls. 15c.

Discusses methods of measuring the winter flow of streams.

*345. Contributions to the hydrology of the United States, 1914. N. C. Grover, chief hydraulic engineer. 1915. 225 pp., 17 pls. 30c. Contains:

*(e) A method of determining the daily discharge of rivers of various slope, by M. R. Hall W. E. Hall, and C. H. Pierce, pp. 53–65. 5c. Scope indicated by title.

364. Water analyses from the laboratory of the United States Geological Survey, tabulated by F. W. Clarke, chief chemist. 1914. 40 pp. 5c.

Contains analyses of waters from rivers, lakes, wells, and springs in various parts of the United States, including analyses of the geyser water of Yellowstone National Park, hot springs in Montana, brines from Death Valley, water from the Gulf of Mexico, and mine waters from Tennessee, Michigan, Missouri and Oklahoma, Montana, Colorado and Utah, Nevada and Arizona, and California.

371. Equipment for current-meter gaging stations, by G. J. Lyon. 1915. 64 pp., 37 pls. 20c.

Describes methods of installing recording and other gages and of constructung gage wells shelters, and structures for making discharge measurements and artificial controls.

*375. Contributions to the hydrology of the United States, 1915. N. C. Grover, chief hydraulic engineer. 1916. 181 pp., 9 pls. Contains:

(c) Relation of stream gaging to the science of hydraulics, by C. H. Pierce and R. W. Davenport, pp. 77–84.

(e) A method for correcting river discharge for changing stage, by B. E. Jones, pp. 117–130.

(f) Conditions requiring the use of automatic gages in obtaining stream-flow records, by C. H. Pierce, pp. 131–139.

*400. Contributions to the hydrology of the United States, 1916. N. C. Grover, chief hydraulic engineer. Contains:

(a) The people's interest in water-power resources, by G. O. Smith, pp. 1–8.

(c) The measurement of silt-laden streams, by Raymond C. Pierce, pp. 39–51.

(d) Accuracy of stream-flow data, by N. C. Grover and J. C. Hoyt, pp. 53–59.

416. The divining rod, a history of water witching, with a bibliography, by Arthur J. Ellis. 1917. 39 pp. 10c.

A brief paper published "merely to furnish a reply to the numerous inquiries that are continually being received from all parts of the country" as to the efficacy of the divining rod for locating underground water.

425. Contributions to the hydrology of the United States, 1917, N. C. Grover, chief hydraulic engineer. 1918. Contains:

(c) Hydraulic conversion tables and convenient equivalents, pp. 71–94. 1917.

427. Bibliography and index of the publications of the United States Geological Survey relating to ground water, by O. E. Meinzer. 1918. 169 pp., 1 pl.

Includes publications prepared, in whole or part, by the Geological Survey that treat any phase of the subject of ground water or any subject directly applicable to ground water. Illustrated by map showing reports that cover specific areas more or less thoroughly.

PROFESSIONAL PAPERS.

*72. Denudation and erosion in the southern Appalachian region and the Monongahela basin, by L. C. Glenn. 1911. 137 pp., 21 pls. 35c.

Describes the topography, geology, drainage, forests, climate, population, and transportation facilities of the region, the relation of agriculture, lumbering, mining, and power development to erosion and denudation, and the nature, effects, and remedies of erosion; gives details of conditions in Holston, Nolichucky, French Broad, Little Tennessee, and Hiwassee river basins, along Tennessee River proper, and in the basins of the Coosa-Alabama system, Chattahoochee, Savannah, Saluda, Broad, Catawba, Yadkin, New, and Monongahela rivers.

86. The transportation of débris by running water, by G. K. Gilbert, based on experiments made with the assistance of E. C. Murphy. 1914. 263 pp., 3 pls. 70c.

The results of an investigation which was carried on in a specially equipped laboratory at Berkeley, Calif., and was undertaken for the purpose of learning "the laws which control the movement of bed load and especially to determine how the quantity of load is related to the stream's slope and discharge and to the degree of comminution of the débris."

A highly technical report.

105. Hydraulic mining débris in the Sierra Nevada, by G. K. Gilbert. 154 pp., 34 pls. 1917.

Presents the results of an investigation undertaken by the United States Geological Survey in response to a memorial from the California Miners' Association asking that a particular study be made of portions of the Sacramento and San Joaquin valleys affected by detritus from torrential streams. The report deals largely with geologic and physiographic aspects of the subject, traces the physical effects, past and future, of the hydraulic mining of earlier decades, the similar effects which certain other industries induce through stimulation of the erosion of the soil, and the influence of the restriction of the areas of inundation by the construction of levees. Suggests cooperation by several interests for the control of the streams now carrying heavy loads of débris.

BULLETINS.

*32. Lists and analyses of the mineral springs of the United States (a preliminary study), by A. C. Peale. 1886. 235 pp.

Defines mineral waters, lists the springs by States, and gives tables of analyses so far as available.

*264. Record of deep-well drilling for 1904, by M. L. Fuller, E. F. Lines, and A. C. Veatch. 1905. 106 pp. 10c.

*298. Record of deep-well drilling for 1905, by M. L. Fuller and Samuel Sanford. 1906. 299 pp. 25c.

Bulletins 264 and 298 discuss the importance of accurate well records to the driller, to owners of oil, gas, and water wells, and to the geologist; describes the general methods of work; gives tabulated records of wells by States, and detailed records selected as affording valuable stratigraphic information.

*319. Summary of the controlling factors of artesian flows, by Myron L. Fuller. 1908. 44 pp., 7 pls. 10c.

Describes underground reservoirs, the sources of underground waters, the confining agents, the primary and modifying factors of artesian circulation, the essential and modifying factors of artisian flow, and typical artisian systems.

*479. The geochemical interpretation of water analyses, by Chase Palmer. 1911. 31 pp. 5c.

Discusses the expression of chemical analyses, the chemical character of water, and the properties of natural waters; gives a classification of waters based on property values and reacting values, and discusses the character of the waters of certain rivers as interpreted directly from the results of analyses; discusses also the relation of water properties to geologic formations, silica in river water, and the character of the water of the Mississippi and the Great Lakes and St. Lawrence River as indicated by chemical analyses.

616. The data of geochemistry (third edition), by F. W. Clarke. 1916. 821 pp. 45c.

Earlier editions were published as Bulletins 330 and 491. Contains a discussion of the statement and terpretation of water analyses and a chapter on "Mineral wells and springs" (pp. 179-216). Discusses the definition and classification of mineral waters, changes in the composition of water, deposits of calcareous, ocherous and siliceous materials made by water, vadose and juvenile waters, and thermal springs in relation to volcanism. Describes the different kinds of ground water and gives typical analyses. Includes a brief bibliography of papers containing water analyses.

ANNUAL REPORTS.

*Fifth Annual Report of the United States Geological Survey, 1883–84, J. W. Powell, Director. 1885. xxxvi, 469 pp., 58 pls. $2.25. Contains:

*The requisite and qualifying conditions of artesian wells, by T. C. Chamberlain, pp. 125 to 173, Pl. 21. Scope indicated by title.

*Twelfth Annual Report of the United States Geological Survey, 1890–91, J.W. Powell, Director. 1891. 2 parts. Pt. II—Irrigation, xviii, 576 pp., 93 pls. $2. Contains:

*Irrigation in India, by H. M. Wilson, pp. 363-561, Pls. 107 to 146. See Water-Supply Paper 87.

Thirteenth Annual Report of the United States Geological Survey, 1891–92, J. W. Powell, Director. 1892. (Pts. II and III, 1893.) 3 parts. *Pt. III—Irrigation, xi, 486 pp., 77 pls. $1.85. Contains:

*American irrigation engineering, by H. M. Wilson, C. E., pp. 101–349, Pls. 111 to 146. Discusses the economic aspects of irrigation, alkaline drainage, silt, and sedimentation; gives brief history and legislation; describes canals; discusses water storage at reservoirs of the California and other projects, subsurface sources of supply, pumping, and subirrigation.

Fourteenth Annual Report of the United States Geological Survey, 1892–93, J. W. Powell, Director. 1893. (Pt. II, 1894). 2 parts. *Pt. II—Accompanying papers, xx, 597 pp., 73 pls. $2.10. Contains:

*The potable waters of the eastern United States, by W J McGee, pp. 1 to 47. Discusses cistern water, stream waters, and ground waters, including mineral springs and artesian wells.

*Natural mineral waters of the United States, by A. C. Peale, pp. 49–88, Pls. 3 and 4. Discusses the origin and flow of mineral springs, the source of mineralization, thermal springs, the chemical composition and analysis of spring waters, geographic distribution, and the utilization of mineral waters; gives a list of American mineral spring resorts; contains also some analyses.

Nineteenth Annual Report of the United States Geological Survey, 1897–98, Charles D. Walcott, Director. 1898. (Parts II, III, and V, 1899.) 6 parts in 7 vols. and separate case for maps with Pt. V. *Pt. II—Papers chiefly of a theoretic nature, v. 958 pp., 172 pls. $2.65. Contains:

*Principles and conditions of the movements of ground water, by F. H. King, pp. 59–294, Pls. 6 to 16. Discusses the amount of water stored in sandstone, in soil, and in other rocks; the depth to which ground water penetrates; gravitational, thermal, and capillary movements of ground waters, and the configuration of the ground-water surface; gives the results of experimental investigations on the flow of air and water through rigid porous media and through sands, sandstones, and silts; discusses results obtained by other investigators, and summarizes results of observations; discusses also rate of flow of water through sand and rock, the growth of rivers, rate of filteration through soil, interference of wells, etc.

*Theoretical investigation of the motion of ground waters, by C. S. Slichter, pp. 295–384, Pl. 17. Scope indicated by title.

INDEX BY AREAS AND SUBJECTS.

[A—Annual Reports; M—Monograph; B—Bulletin; P—Professional Paper; W—Water-Supply Paper; GF—Geologic folio. For titles see preceding pages.]

[1] Many of the reports contain brief subject bibliographies. See abstracts.
[2] Many analyses of river, spring, and well waters are scattered through publications, as noted in abstracts.
